2904. Tyler Forrest B., & Whisenhut, James W. (Southern Illinois U.) **Motivational changes during preschool attendance.** *Child Developm.*, 1962, 33(2), 427-442.—Descriptive observations from 2 samples of children enrolled in different years in the same preschool were analyzed for changes in the motivational characteristics of the children's behavior. Data for each sample were collected over a 3-month period. The 2 samples became more alike in terms of independence behavior and there was no evidence that preschool functioned to increase homogeneity of behavior.—*W. J. Meyer.*

2905. Unger, Sanford M. (National Inst. Mental Health) **Antecedents of personality differences in guilt responsivity.** *Psychol. Rep.*, 1962, 10(2), 357-358.—A projective test, designed to measure guilt potential, and parts of the Children's Manifest Anxiety Scale judged to measure guilty apprehension were administered to 6th-grade students (N = 328).

Correlations between test scores and questionnaire answers by the children with regard to parental behavior are reported and discussed in relation to a 2-stage theory of guilt consisting of a verbal stage and an autonomic-visceral stage.—*B. J. House.*

2906. Wing, Lucy Florence. (Syracuse U.) The effects of different expectancies followed by failure on the performance, preference, and goals of task-oriented and failure-avoidant children. *Dissert. Abstr.*, 1962, 22(12), 4404.—*Abstract.*

Parent-Child Relations

2907. Ambinder, Walter; Fireman, Laura; Sargent, Douglas, & Wineman, David. Role phenomena and foster care for disturbed children. *Amer. J. Orthopsychiat.*, 1962, 32(1), 32-41.—Interviews with 50 foster parents who care for "hard to place" juvenile court wards indicate vagueness about respective roles of foster parents, caseworkers, and agencies. A clearer role image must be constructed for foster parents and for caseworkers. Foster parents' role must be redefined in a manner consistent with the rehabilitative goal of their tasks. Caseworkers must be prepared to give specific support to foster parents who perform in the redefined role and be available for consultation, advice, and active intervention where these activities are pertinent. Someone should define the role the foster child should play in the system. In the discussion Catherine Berwald suggests that perhaps classes and study groups should be established for child welfare workers so that they could learn what foster parents need to know.—*R. R. Perl.*

2908. Andrieux, Cecile. Association de quelques variables socio-culturelles avec la représentation du rôle de la mère. [Association of some sociocultural variables with the representation of the role of the mother.] *Psychol. Franc.*, 1961, 6(2), 126-136.—216 working women and 184 nonworking women were administered a questionnaire to determine their attitudes concerning the advisability for mothers of preschool children to be employed outside of the home. An analysis of variance was calculated on the responses to determine the effects of employment, profession, educational level, religion, politics, economic level, and number of children.—*C. J. Adkins.*

2909. Bath, John A., & Lewis, Edwin C. (Iowa State U.) Attitudes of young female adults toward some areas of parent-adolescent conflict. *J. genet. Psychol.*, 1962, 100(2), 241-253.—103 college women were administered 2 questionnaires. The first asked for attitudes toward 37 problems regarding parental control of an adolescent girl. The 2nd asked for information concerning personal data, practices in their own home in the same 37 areas, and the amount of conflict occurring between them and their parents in each of these areas when the Ss were adolescents. It was found that the more severe and inconsistent parental practices produced the most conflict, although in general the treatment had not been greatly restrictive. The amount of conflict in the home was unrelated to any of the personal data. Degree of rigidity of attitudes toward parental treatment of an adolescent was found to be positively related to rural background and negatively related to a maternally-dominated authority pattern in the family. Attitudes were found to be unrelated to the degree of conflict experienced in the home in any of the areas. A high degree of

similarity was found between parental practices in the family and present attitudes toward parental treatment of an adolescent.—*Author abstract.*

2910. Bond, Alma Marian. (Columbia U.) Grandmothers' attitudes and mothers' concerns. *Dissert. Abstr.*, 1961, 22(4), 1240.—*Abstract.*

2911. Bowerman, Charles E., & Irish, Donald P. (U. North Carolina) Some relationships of stepchildren to their parents. *Marriage fam. Liv.*, 1962, 24(2), 113-121.—The child-parent adjustment of approximately 29,000 7th-12th graders, 2145 of them stepchildren, was measured through questionnaires administered by classroom teachers. The students were caucasian and preponderately Protestants. Step-relationships showed more stress, ambivalence, and low cohesiveness than did normal homes. Stepmothers had more difficult roles than did stepfathers. Stepdaughters manifested more extreme reactions than did stepsons. The presence of a stepparent tended adversely to influence the adjustment of the child to the natural parent.—*L. Shatin.*

2912. Brock, Helene. Untersuchungen über die Entwicklung der Kinder nervenkranken Mütter. [Investigation of the development of children of mentally ill mothers.] *Acta paedopsychiat.*, Basel, 1962, 29(1), 116-123.—Of 143 women in psychiatric treatment, 67 were seriously neurotic or psychopathic. In most cases the disorder preceded the birth of children or occurred shortly thereafter. Of the 196 children whose mothers fell ill before birth or during the 1st-3rd year, good or average development was noted in 80%. Of the 44 whose mothers fell ill in the 4th-6th year or more, good or average development was noted in 89%. The hypothesis that the character is permanently distorted through constant negative maternal relations is not supported.—*G. Rubin-Rabson.*

2913. Brooks, Melvin S., Rennie, Douglas L., & Sondag, Roger F. (Southern Illinois U.) Sociological variables in the reaction of parents to child-rearing information. *Merrill-Palmer Quart.*, 1962, 8(3), 175-182.—Interviews with 69 mothers who had received public health department letters on child-rearing practices indicated that 58% had read all 12 of the letters. Mothers with 1 year or more of college education reported more reading. A negative relationship was found between reading of the letters and both upward and downward social mobility. Rurally reared women read as much as did those from urban homes.—*E. L. Robinson.*

2914. Camilleri, C. Les rapports familiaux du jeune Tunisien de culture occidentale. [Family relationships of the young Tunisian of occidental culture.] *Enfance*, 1962, No. 1, 35-51.—A questionnaire was submitted to 240 Tunisian young men and 150 young women, mean age 21-3. The total group consisted of 3 subgroups as follows: I, youth and the parents living in Tunis; II, provincial youth attending school in Tunis; III, youth living in and attending school in the provinces. Responses to the questionnaire were scaled in terms of the degree of family integration shown. There is little difference in the mean scale values of the 3 groups. However, items having higher than average scale values were those having to do with personal relations with the parents, the "existential" items. Items having lower than average integration values were those having to do with ideals,—the cultural. In general it is concluded that little disharmony with the family is now present,

but that this generation will do things differently when it has the opportunity.—S. S. Marzolf.

2915. Colwell, James Morrison. (American U.) The relation of controlling and hostile attitudes of mothers to certain personality traits in children. *Dissert. Abstr.*, 1961, 22(4), 1241.—Abstract.

2916. Eisenberg, Leon. The sins of the fathers: Urban decay and social pathology. *Amer. J. Orthopsychiat.*, 1962, 32(1), 5-17.—A study of foster children referred for consultation service indicates that many of them are relatively inarticulate; show poor orientation to time, place, and person; and are apathetic and mistrustful in a clinical interview. Many of them are almost unsocialized when they come into care. Perhaps the insistence on foster care may be an anachronism in an era when the family as an institution is undergoing rapid change. Perhaps a durable group home might be a better solution for some children than a series of inadequate foster homes. Might we not do more for children by enriching A. D. C. programs, public housing, health services, marriage counseling, and family services so as to preserve the family of origin?—R. E. Perl.

2917. Elder, G. H. (U. North Carolina) Structural variations in the child rearing relationship. *Sociometry*, 1962, 25(3), 241-262.—Autocratic authoritarian, democratic, equalitarian, permissive, laissez-faire, and ignoring are 7 types of child rearing relationships identified in this study of (a) the relationship between social class, education, religion of parent, size of family, and the child rearing structures, and (b) the effects of the relationship upon parent and adolescent affective relations and the adolescent's attitude toward the child rearing policy. The data are the responses of 7400 adolescents living in Ohio and North Carolina to a structured questionnaire. "Parental dominance was most common to parents of low SES who are Catholic, and who have large families. Mutual rejection in parent adolescent relations and unfavorable evaluations of parental policy was greatest in autocratically structured relationships."—H. P. Shelley.

2918. Emery-Hauzeur, C., & Sand, E.-A. Enfants désirés et non désirés. [Desired and not desired children.] *Enfance*, 1962, No. 2, 109-126.—Mothers who volunteered participation in researches carried on at the University of Brussels were interviewed shortly after the birth of a child on a variety of subjects. The 215 who admitted not wanting to have a child at that time constituted the sample. Their children were observed at regular intervals beginning when the child was 4 weeks old. Incidence of illness, accidents, developmental quotients, number of visits to the study center, and parent behavior toward the child were compared with data from a similar group of mothers who wanted the child. Statistically significant differences were found and in general it is concluded that the undesired child is more likely to show slower intellectual and motor development, manifest signs of anxiety, desire attention and support, and manifest hostility.—S. S. Marzolf.

2919. Goodstein, Leonard D., & Rowley, Vinton N. (U. Iowa) A further study of MMPI differences between parents of disturbed and nondisturbed children. *J. consult. Psychol.*, 1961, 25(5), 460.—Analysis of MMPI profiles indicates that "par-

ents of disturbed children are themselves more maladjusted than parents of nondisturbed children [see 34: 4393]."—E. R. Oetting.

2920. Hollenbeck, George Penn. (U. Wisconsin) The use of the Relationship Inventory in the prediction of adjustment and achievement. *Dissert. Abstr.*, 1961, 22(6), 2063-2064.—Abstract.

2921. Jones, Eve J. S. The intelligent parents' guide to raising children. New York: Free Press Glencoe, 1962. 288 p. \$4.95.—Originally published in 1959 under the title *Natural Child Rearing*, this is written as a practical manual and guide for parents and is concerned with applications of clinical and child psychology to the everyday problems of rearing children. Major topics covered include: physiological and psychological needs of infancy, comfort and care, independence, freedom-praise-protection, unreasonable expectations, responsibilities, socialization, sexuality, latency period, and adolescence.—D. G. Brown.

2922. Kearsley, R., Snider, M., Richie, R., Crawford, J. D., & Talbot, N. B. (Massachusetts General Hosp., Boston) Study of relations between psychologic environment and child behavior. *Amer. J. Dis. Children*, 1962, 104(1), 12-20.—From a questionnaire answered by parents of 721 children, disturbed children were significantly differentiated from healthy children in terms of 3 indices of parental behavior, viz., contact, authority, and approval. Disturbed children had more parental contact and authority and less approval than did healthy children.—A. B. Warren.

2923. Landis, Judson T. A re-examination of the role of the father as an index of family integration. *Marriage fam. Liv.*, 1962, 24(2), 122-128.—3000 students from college classes in family sociology were surveyed with the Burgess-Wallin marital prediction schedule "to test the general hypothesis that the relationship of children with the father is a more reliable index of family integration than is the children's relationship with the mother, and that the relationship with both parents is an even more accurate index of family integration." Affirmative support was found for both of these hypotheses.—L. Shatin.

2924. Lobrat, M. Sociologie des attitudes éducatives. [Sociology of the educative attitudes.] *Enfance*, 1962, No. 1, 69-83.—A sample of 5000 urban French kindergarten children was selected. For each child information concerning the socio-economic status of his family was obtained. Also responses to questionnaires were obtained from teachers, parents, and the children. Parents were questioned concerning their attitudes toward a variety of management situations and the teachers concerning the child's social maturity. The children's question permitted projective responses. Results were analyzed in relation to the father's occupational level. A smaller sample consisted of 3 groups of children viz. (a) interested in school, (b) apathetic, and (c) turbulent. The major conclusions are that the least desirable parental attitude is the authoritarian and restrictive, and that socialization is fostered by parents who seek to transmit social ideals by persuasion and kindness.—S. S. Marzolf.

2925. McCord, William, McCord, Joan, & Verden, Paul. (Stanford U.) Familial and behavioral correlates of dependency in male children. *Child Developm.*, 1962, 33(2), 313-326.—In using a

sample of boys drawn from the Cambridge-Somerville experiment, it was possible to analyze, through direct observation, some of the antecedents of dependent behavior. The following tentative conclusions were made: Lack of family cohesion and parental rejection of the child heightened the child's overt dependent behavior; frustration of dependency needs can lead to a variety of behaviors dependent upon other experiences within the family; the dependent boys were subject to feelings of inferiority, abnormal fears, sexual anxieties, sadistic tendencies, and were more likely, in adulthood, to experience a psychotic breakdown.—*W. J. Meyer.*

2926. **Mehlman, Benjamin; Volio, Anne M., Jamieson, Betty B., & Gligor, Alice M.** (1015 Robray Dr., Silver Spring Md.) **Childrearing practices in Kent, Ohio.** *Child Developm.*, 1962, 33(2), 391-401.—"The parents of 4-year-old children were interviewed about their child rearing practices. 62 cases were interviewed from the universe of 148 known births during the period July 1, 1950, to June 30, 1951. The data were analyzed in terms of socioeconomic status. 35 of the children were also observed in a permissive situation and given the Stanford-Binet. 'Only the age at which diurnal bladder control training was begun reached a level of statistical significance in our home interview results. Only differences in IQ were statistically significant in our permissive situation results.'—*W. J. Meyer.*

2927. **Missildine, W. Hugh.** (Columbus, O.) **The mutual respect approach to child guidance.** *Amer. J. Dis. Children*, 1962, 104(2), 116-121.—"An approach to problems of child guidance is presented using the concept of mutual respect. It assumes that mental health is facilitated if members of a family unit live in such a way that each pursues his satisfactions in his own unique way and is limited when this pursuit infringes on the rights of the other members. Some of the typical infringements of the culture are discussed. . . . This study (of 97 children) gives some evidence that most families can benefit from just child guidance suggestions alone (without the need for direct therapy).—*A. Barclay.*

2928. **Rheingold, Harriet L., Stanley, Walter C., & Cooley, John A.** (National Inst. Mental Health, Bethesda, Md.) **Method for studying exploratory behavior in infants.** *Science*, 1962, 136(Whole No. 3521), 1054-1055.—An experimental crib has been designed for use in studying the effect of visual feedback upon the exploratory behavior of the human infant. It can be easily adapted to older children, to some animals, and to problems other than the development of exploratory behavior.—*Journal abstract.*

2929. **Sanchez-Hidalgo, Efrain.** (U. Puerto Rico) **La psicología de la crianza.** [The psychology of rearing.] Madrid, Spain: Talleres Tipograficos Ferreira, 1962. 258 p.—In this message to Puerto Rican parents, 33 chapters deal with topics such as: the beginning of life, the family and the socialization process, jealousy, sleep, feeding, elimination, activity and experiences, self-development, maturity, physical activity, egocentrism, negative and aggressive conduct, rejection and protection, discipline, love and praise, punishment, fear and anger, the gang, the emancipation process, moral development, sex identification, puberty and its significance, bodily changes and their significance, adolescence and freedom, and the understanding of adolescence.—*Author abstract.*

2930. **White, Joseph Lewis, Jr.** (Michigan State U.) **Attitudes toward child rearing as related to some psychodynamic factors in mothers.** *Dissert. Abstr.*, 1962, 22(12), 4414-4415.—*Abstract.*

2931. **Winer, Frank.** (New York U.) **The relationship of certain attitudes toward the mother to sex-role identity.** *Dissert. Abstr.*, 1962, 22(12), 4416.—*Abstract.*

2932. **Yarrow, M. R., Scott, P., deLeeuw, L., & Heinig, C.** (National Inst. Mental Health, Bethesda, Md.) **Child-rearing in families of working and nonworking mothers.** *Sociometry*, 1962, 25(2), 122-140.—Interview data were obtained from 50 working and 50 nonworking mothers from comparable, intact, white, economically stable families where employment was a matter of choice. Child rearing practices are not related to work status until maternal motivation and education are taken into account. "Mothers who prefer to work but out of a sense of 'duty' do not work report the most problems in child rearing. Children are under firmer control and are given more responsibilities by working mothers than by nonworking mothers with high school training. This difference does not exist between working and nonworking college-trained mothers. College-trained families tend to compensate for mother's employment away from home by more planned activities with the children."—*H. P. Shelley.*

ADOLESCENCE

2933. **de Trautenberg, Nina Rausch.** **Réactions perceptives d'adolescents de différents groupes cliniques.** [Perceptive reactions of adolescents from different clinical groups.] *Psychol. Franc.*, 1962, 7(1), 42-55.—A group of 70 Ss from 6 clinical groups (schizophrenic, epileptic, neurotic, psychopathic, obsessive, paranoid) were administered a series of perceptual tests (including Pochoirs, Rey, Benton Visual Retention Test, Kohs Block Design Test, Thurstone's Factor S, and some optical illusions). The scores were found to vary both with intelligence and with clinical diagnosis.—*C. J. Adkins.*

2934. **Goldman, Samuel.** (Oklahoma State U.) **Profiles of an adolescent.** *J. Psychol.*, 1962, 54(1), 229-240.—On a questionnaire made up of qualities normally attributed to an adolescent, 153 high school teachers, 224 parents and 956 high school students were asked to rank their perceptions of a real and ideal high school graduate. All 3 groups showed higher within-group agreement on their ideal profile than they did on their real profile. Teachers and parents, and students and parents showed high agreement on their rankings on both the real and ideal profiles. Teachers and students showed higher agreement on the ideal profile than they did on the real profile. A rank order correlation between real and ideal for each group revealed a correlation for teachers of .53, for parents .15, and for high school students .46. These data suggest that adults appear to be more dissatisfied with today's adolescent than the adolescents are of themselves. This difference in level of dissatisfaction emphasizes the conflict which exists between these adults and adolescents.—*Author abstract.*

2935. **Khomenko, K. E.** (Pedagogical Inst., Kharkov, USSR) **Roľ kinestezicheskogo i zritel'nogo kontrolia v vypolnenii dvizhenii det'mi sred-**

nego shkol'nogo vozrasta. [The role of kinesthetic and visual control in the movements performed by children of secondary school age.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 2, 85-88.—100 Ss (age 10-14), 50 boys and 50 girls, were instructed to reproduce arm movements of different amplitudes (30°, 45°, and 60°) under the following conditions: visual reproduction of movement, reproduction on the basis of past memory, and production without any reinforcement on the basis of mental representation. It was found that the accuracy increases with age and is affected by the type of control.—*A. Cuk.*

2936. Khon, Alan Robert. (U. Illinois) Self-evaluation as related to evaluations by parents and peers at preadolescence and adolescence. *Dissert. Abstr.*, 1961, 22(5), 1716-1717.—*Abstract.*

2937. Leboutet, Lucie. (Faculté Lettres et Sciences Humaines, Caen, France) Étude génétique de l'acquisition d'un concept scientifique chez des préadolescents et les adolescents. [Genetic study of the acquisition of a scientific concept with preadolescents and adolescents.] *Psychol. Franc.*, 1962, 7(1), 17-25.—2 questionnaire studies (one individual and verbal, the other written and group) were administered to over 800 students in an attempt to investigate the change in understanding of the concept of weight with increasing age from 11 to 18 years. The expected change with age was noted and some of the errors were analyzed.—*C. J. Adkins.*

2939. Nelson, E. K. (U. Southern California) Program orientations of a youth studies center. *Sociol. soc. Res.*, 1962, 46(4), 466-474.—The 2 major items considered by the Youth Studies Center of the University of Southern California for program orientations are: (a) the general rationale employed in the selection of program objectives and in developing criteria for assigning priority to potential projects, and (b) the conceptional or theoretical positions that are particularly influential in shaping the content and methodology of the various projects. The 2 main considerations are the integrating themes and the feedback process which provides the basis for integration.—*Journal abstract.*

2940. Stensaasen, Svein. Amerikanske laerebøker i ungdomspsykologi. [American textbooks on adolescent psychology.] *Norsk pedagog. Tidsskr.*, 1962, 46(2), 75-87.—12 texts on adolescence are evaluated in terms of their points of view, coverage, and organization. The books reviewed are by the following authors: G. S. Hall, L. D. & Alice Crow, K. C. Garrison, Elizabeth Hurlock, A. T. Jersild, R. G. Kahlen, P. H. Landis, Marguerite Malm & O. G. Jamison, Ruth Strang, W. W. Wattenberg, and D. P. Ausubel.—*L. Goldberger.*

2941. Winick, Charles. (Columbia U.) Teen-agers, satire and "Mad." *Merrill-Palmer Quart.*, 1962, 8(3), 183-203.—411 regular readers of *Mad* were interviewed to determine attitudes toward the magazine, pattern of reading, and participation in teenage culture. Results were related to content analysis of *Mad* and to current theory on adolescent development.—*E. L. Robinson.*

MATURITY & OLD AGE

2942. Beck, H., Durey, D., & Pacaud, S. Comparaison entre l'auto-jugement du vieillard et le jugement porté sur lui par le personnel le soignant. [Comparison between the self-evaluation of the aged and evaluation of him by the nursing staff.] *Hyg. ment.*, 1962, 51(2), 52-64.—A group of 75 older patients (25 male, 50 female, ages 65-90) evaluated their own condition in regard to general state, appetite, sleep during the night, sleep during the day, tiring, emotional condition, sociability, and leisure occupations. Least accord with evaluations of the nursing staff was found regarding general state, sleep during night, and appetite.—*W. W. Meissner.*

2943. Birren, J. E. (National Inst. Mental Health, Bethesda, Md.) Age differences in learning a two-choice water maze by rats. *J. Gerontol.*, 1962, 17, 207-213.—2 studies were performed to investigate the role of age in rat-learning of a simple 2-choice maze. In the 1st study, "middle-aged and old animals, in comparison with the young, tended to make somewhat more errors on the first trial." In the 2nd experiment, designed "to avoid the problem of position or orientation tendencies raised by the first study," no age differences in learning were observed.—*J. Botwinick.*

2944. Birren, James E., Jerome, Edward A., & Chown, Sheila N. (National Inst. Mental Health, Bethesda, Md.) Aging and psychological adjustment: Problem solving and motivation. *Rev. educ. Res.*, 1961, 31(5), 487-499.—The psychology of aging recently made a considerable advance in organization of information. A significant change in the attitudes of society was shown by the dropping of resistance to research on aging and by movement toward a phase of active encouragement. Aging must be regarded as a basic problem requiring an evolutionary approach, for as early manifestations of aging become understood and controlled, new manifestations will emerge. The results of different test methods indicate that the aged tend to evade, when possible, the analysis of logical forms and the evaluation of arguments on the basis of their logical merits. They prefer to base their conclusions on what they believe to be the truths involved. Data from a large number of cross-sectional investigations encourage the belief that problem-solving abilities of mature persons differ widely with age. (46 ref.)—*F. Goldsmith.*

2945. Boozer, D. Geraldine. (Louisiana State U.) Response sets as indicators of senescence and of psychopathology in old age. *Dissert. Abstr.*, 1961, 22(3), 910.—*Abstract.*

2946. Botwinick, J. (National Inst. Mental Health, Bethesda, Md.) A research note on the problem of perceptual modification in relation to age. *J. Gerontol.*, 1962, 17, 190-192.—Elderly Ss, 69-86 yr., and young Ss, 19-27 yr., were compared "with respect to the point in two series when decisions were reported that an initial percept shifted to a subsequent one." The elderly shifted percepts somewhat sooner in the series than did the younger. This suggests, when viewed in the context of previous studies, "that given appropriate, structured sets, rather than opportunity to develop the sets, older subjects will perform with minimum difficulty."—*J. Botwinick.*

2947. Broadbent, D. E., & Heron, Alastair. (Medical Research Council, Cambridge) Effects of a subsidiary task on performance involving im-

mediate memory by younger and older men. *Brit. J. Psychol.*, 1962, 53(2), 189-198.—"In the present experiment, conducted with groups of young and of old subjects, it was found that the tasks involving memory are very vulnerable to distraction. The older subjects differed greatly among themselves, some being seriously inferior in performance to younger subjects; no such difference in variance appears in the similar task without memory load. When a distracting task is presented together with a main task involving memory, older subjects do very badly at one or the other, whereas young subjects do reasonably at both."—C. T. Morgan.

2948. Caird, William K., Sanderson, Robert E., & Inglis, James. (Queen's U., Kingston, Ontario) Cross-validation of a learning test for use with elderly psychiatric patients. *J. ment. Sci.*, 1962, 108(Whole No. 454), 368-370.—The Inglis paired associates test gives results on Canadian patients much like those on British patients.—W. L. Wilkins.

2949. Carmel, R., Copelman, L.-S., & Copelman, R.-S. Études et recherches en vue de créer les prémisses d'une hygiène mentale adaptée aux différents âges physiologiques de la vieillesse. Le concept d'une crise d'involution physiologique. [Studies and research with a view to creating the premises of a mental hygiene adapted to the different physiological periods of old age. The concept of a crisis of physiological involution.] *Hyg. ment.*, 1962, 51(2), 70-79.—Results of measurement of respiratory capacity, muscular force, erography, motricity, structure of personality (Rorschach), psychogalvanic reflex, and intuition of time are analyzed. The distinction between chronological and biological age is discussed. Experimental indications for preventing biological senility are reviewed briefly.—W. W. Meissner.

2950. Chatagnon, P.-A. (Paris) Organisation social du travail et des occupations pour les personnes âgées. Le prolongation du temps moyen de la vie et les possibilités d'activité du "troisième âge": Revision de la notion de l'âge légal de la retraite. [The social organization of work and occupations for elderly persons. The prolongation of middle-age and the possibilities of activity in the "third age": Revision of the notion of the legal age of retirement.] *Hyg. ment.*, 1962, 51(2), 45-51.—The "3rd age" is considered as a pivotal period between the period of adulthood and retirement. The psychological and social benefits accruing from the gainful employment of this age group are described. The legal age of retirement should be put off 5-10 years (varies in France from 45 to 65).—W. W. Meissner.

2951. Clément, F. Un inventaire d'intérêts pour personnes âgées: Elaboration et résultats. [An interest inventory for the aged: Elaboration and results.] *Rev. Psychol., appl.*, 1962, 12(1), 1-13.—A 2-part interest inventory for work with old people was developed. The 1st part, designed to measure hierarchy of interests, is an elaboration of the Allport-Vernon questionnaire. The 2nd part, based on expert opinion, calls for degree of interest in 33 statements in the past and the present. It was administered to 18 men and women under 45, 9 men and 7 women between 45 and 65, and 9 men and 15 women over 65. Over a 10-day period the test-retest reliability for the 1st part was .62 for the men and .77 for the women; for the 2nd part, .98 and .97. With age there was a

drop in interest for intellectual activities and an increase in interest in their own health.—W. W. Wattenberg.

2952. Jarvik, Lissy, F., Kallmann, F. J., & Falex, A. (Columbia U.) Intellectual changes in aged twins. *J. Gerontol.*, 1962, 17, 289-294.—Longitudinal psychometric data of senescent twins were analyzed with respect to intra-pair correlations, comparisons of twins, general population norms, and age changes. No significant change in intrapair correlations were found, twins performance scores were at least as high as those of the norms of singletons, and the test battery reflected both age decrements and age increments of performance.—J. Botwinick.

2953. Katz, L., & Crook, G. H. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) Use of the Kent E-G-Y with an aged population. *J. Gerontol.*, 1962, 17, 186-189.—"Tentative Kent E-G-Y norms for 253 individuals aged 60 and over, matched for education and employment status with the general United States urban population in the same age range, are presented separately for men and women."—J. Botwinick.

2954. Kendall, B. S. (Washington U. School Medicine) Memory-for-designs performance in the seventh and eighth decades of life. *Percept. mot. Skills*, 1962, 14(3), 399-405.—A sample of 36 brain-disordered Ss 61-80 yr. of age was matched with a sample of 36 control Ss for age, education, and occupation, and the 2 groups were compared with respect to performance on the Memory-for-Designs Test. MFD Test scores significantly differentiated between an aged brain-disordered and an aged control group. Qualitative features found earlier in a larger, younger sample also appeared with greater frequency in the work of the brain-disordered sample. However, there was more overlap; the scores of the controls (% of whom were psychotic) tended to be disproportionately higher than those of control Ss aged 16 to 60 yr. Qualitative features suggestive of brain syndrome also occurred more often in the drawings of these control Ss than in those of their younger counterparts.—W. H. Guertin.

2955. Levinson, Boris M. (Yeshiva U.) Positional and figural errors made by the aged or Raven Coloured Progressive Matrices. *J. genet. Psychol.*, 1962, 100(2), 183-192.—Assuming that aging, per se, is not the critical determinant of test performance, a study was made of the positional and figural errors on Raven Coloured Progressive Matrices made by 143 men and women ranging in age from 60-69 and 70-84. Their positional choices are different from those made by children. The medial position was preferred by 40.75%. This was followed by the left lateral, 32.65%, and the right lateral, 26.60%. There is some accentuation of the medial position from 40.13% of choices for aged 60-69 to 41.39% of choices for ages 70-84. There is no difference between the 2 groups in sensible errors. However, there is a statistically insignificant decrease in "repetitive" errors made by the 70-84 group.—Author abstract.

2956. Maddox, G. L. (Duke U. Medical Cent.) Some correlates of differences in self-assessment of health status among the elderly. *J. Gerontol.*, 1962, 17, 180-185.—Data of 251 noninstitutionalized elderly Ss suggest that self-assessment of health status is related to objective state of health, anxiety about

health, and poor adjustments to the environment.—*J. Botwinick.*

2957. Neugarten, Bernice L. (U. Chicago) "Le *satisfaction de vivre*: Une mesure de la santé mentale dans la vieillesse. ["Satisfaction with life": A measure of mental health in old age.] *Hyg. ment.*, 1962, 51(2), 65-69.—A group of 177 elderly men and women of the middle and working classes were interviewed to determine (a) the degree of pleasure in daily activities, (b) the extent to which they felt life had meaning, (c) their feeling of having achieved the principal ends of existence, (d) the extent to which they had a positive self-image, and (e) the degree of humor and optimism they maintained. These were combined into a Life Satisfaction Rating (LSR). LSR does not depend on age, shows a moderate relation to socio-economic status, shows no difference between sexes, tends to be lower in celibate, divorced, or widowed persons. LSR is likewise positively but not strongly related to the level of social interaction.—*W. W. Meissner.*

2958. Obrist, W. D., Busse, E. W., Eisdorfer, C., & Kleemeier, R. W. (Duke U. Medical Cent.) Relation of the electroencephalogram to intellectual function in senescence. *J. Gerontol.*, 1962, 17, 197-206.—"No significant relationships were observed between EEG and intelligence scores in community volunteers. In contrast, hospital subjects and residents from the old age home showed small but significant correlations."—*J. Botwinick.*

2959. Pacaud, S., & La Halle, M.-O. (U. Paris) Quelques données sur les attitudes dans la vieillesse, à l'égard de la profession qui fut exercée au cours de la vie et à l'égard de la profession rêvée dans la jeunesse. [Some thoughts on the attitudes, among the elderly, in regard to the profession they exercised in life and in regard to the profession they dreamed of in youth.] *Hyg. ment.*, 1962, 51(1), 25-40.—A group of 56 men and 52 women (ages 56-86 years) were drawn from a variety of professions and questioned about their professional interest. The 17 Ss who followed the profession of their dream showed the greatest interest in their work. Further, there is a demonstrable relation between psychic equilibrium and the intensity of professional interest shown in the course of life.—*W. W. Meissner.*

2960. Panayotopoulos, D. Influence du milieu hospitalier psychiatrique sur l'évolution des troubles mentaux séniles. [The influence of the psychiatric hospital milieu on the evolution of senile mental disturbances.] *Hyg. ment.*, 1962, 51(1), 13-24.—Our ideas about geriatric psychiatry have been strongly influenced by physiological notions of the aging process. Senile diseases are strongly influenced by other factors. Hospitalization represents an affective shock and a psychological devaluation which the patient strongly resents. Adaptation to the milieu of a psychiatric hospital is especially difficult for older people, and this, together with the shock of hospitalization, often puts them in a terrible depression. Ways of counteracting these effects are discussed.—*W. W. Meissner.*

2961. Reed, H. B., Jr., & Reitan, R. M. (Indiana U. Medical Center) The significance of age in the performance of a complex psychomotor task by brain-damaged and non-brain-damaged subjects. *J. Gerontol.*, 1962, 17, 193-196.—Brain damaged and non-brain-damaged Ss aged 45-65 yr. were compared

to matched Ss 21-44 yr., with respect to level and improvement scores on the Sequin-Goddard form-board. Tentative support was found "for an hypothesis of similarity between the effects on problem-solving behavior of clinically established brain damage and those of the normal aging process."—*J. Botwinick.*

2962. Reichard, Suzanne; Livson, Florine, & Petersen, Paul G. (U. California, Berkeley) Aging and personality: A study of eighty-seven older men. New York: Wiley, 1962. xv, 237 p. \$7.95.—The role of personality in adjustment to aging within a relatively homogeneous socioeconomic group, age range 55-84 (median, 67), and the significance of this life period as a stage in personality development. Both retired and nonretired manual workers were given a series of depth interviews and psychological tests; psychoanalytic interpretations of data were made. Through correlation and cluster analysis, 5 personality patterns emerged identifying differential adjustments to the aging process. Theoretical implications of such patterns were discussed.—*C. W. Page.*

2963. Reiter, Sidney Randolph. (Columbia U.) The relationship of angry and fearful behavior to perception among institutionalized geriatric residents. *Dissert. Abstr.*, 1961, 22(5), 1718-1719.—*Abstract.*

2964. Stein, Carroll I. (U. Minnesota) The GATB: The effect of age on intersample variations. *Personnel Guid. J.*, 1962, 40(9), 779-783.—Based on 1431 job applicants for jobs in Minnesota, Aptitude V(Verbal) showed a sharp increase up to age 40. Intelligence (G) showed little decrease from age 20 to 40. Spatial (S), Form Perception (P), and Manual Dexterity (M) showed steady decline with age. Motor Coordination (K) showed no age effect until age 40, then decreased sharply. Significant sex differences were found on "G," due perhaps to selection factors.—*S. Kavruck.*

2965. Taubenhau, L. J., & McCormick, J. G. (Brookline Health Dept., Mass.) The aging lodging house resident. *J. Gerontol.*, 1962, 17, 310-314.—"In general, lodgers were found to be older widows, living alone, with low income, who made proportionately less use of health services than did non-lodgers."—*J. Botwinick.*

2966. Webb, Wilse B., & Agnew, Harman W., Jr. (U. Florida) Sleep deprivation, age, and exhaustion time in the rat. *Science*, 1962, 136(Whole No. 3522), 1122.—Male rats were maintained on a constantly moving wheel in a study of prolonged sleep deprivation. The results obtained revealed a striking negative relationship between age and resistance to exhaustion.—*Journal Abstract.*

2967. Werboff, Jack, & Havlena, Joan. (Animal Behavior Lab., Lafayette Clinic) Effects of aging on open field behavior. *Psychol. Rep.*, 1962, 10(2), 395-398.—"Male and female Sprague-Dawley rats were evaluated on the open field test at 90, 180, 360, and 540 days of age. The results confirm previous reports that activity and emotionality decline with increasing age, with the females exhibiting higher activity and emotionality scores than the males. The need for additional data at later ages than those reported here was discussed."—*B. J. House.*

2968. Zborowski, M. (Age Cent. New England, Boston) Aging and recreation. *J. Gerontol.*, 1962,

17, 302-309.—"The major conclusion . . . is that aging has a rather insignificant influence upon people's recreational patterns and preferences."—J. Botwinick.

SOCIAL PSYCHOLOGY

2969. Allport, F. H. (Syracuse U.) **A structural-conceptual conception of behavior: Individual and collective: I. Structural theory and the master problem of social psychology.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 3-30.—The 1st of a series of 2 papers discussing a theoretical approach to conceptualization of theory and principles in social psychology. The present formulation, an extension of a theoretical approach begun in 1942 (Allport, 1942) and elaborated elsewhere (Allport, 1954, 1955) involves understanding social phenomena as a function of "collective structuring." Such a concept is offered as a substitute for other terms implying the group as a referent point, e.g., social norm, life space, group mind, etc. This formulation is necessitated by a need to explain the empirically-derived influence on individual behavior in and out of groups without resorting to epiphenomena. Collective structuring implies the interrelating of individual frames of reference with those of others, born out of a personal involvement and "heightened probability of satisfactions through integrated . . . behaviors."—G. Frank.

2970. Davis, F. James; Foster, Henry H., Jr., Jeffery, C. Ray, & Davis, E. Eugene. (Hamline U.) **Society and the law.** New York: Free Press Glencoe, 1962. vi, 488 p. \$6.95.—A "study of the law in the context of society" produced by "the combined labors of two sociologists, a law teacher, and a practicing attorney." Part I Covers "Law and Social Organization" (3 chapters); Part II, "Law and Social Change" (8 chapters); and Part III, "Lawyers as a Professional Group" (2 chapters). Suggested readings and research topics are included with each chapter. (Case, name, and subject indices)—R. S. Harper.

2971. Diesing, Paul. (U. Illinois) **Reason in society: Five types of decisions and their social conditions.** Urbana, Ill.: Univer. Illinois Press, 1962. 262 p. \$5.75.—The main contention of the author is that there are at least 5 types of rationality in decision making in social behavior. 5 types of rationality are identified and given a comprehensive discussion and analysis. They are: technical, legal, economic, social, and political. The application and limitations of the different types are critically explored. One of the distinctions made is that social rationality is almost entirely unconscious whereas economic, technical, and legal are conscious.—E. D. Lawson.

2972. Kuethe, J. L. (Johns Hopkins U.) **Social schemas.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 31-38.—"Unit forming principles in social perception can be regarded as social schemas or response sets to the extent that they function to structure ambiguous situations involving human objects. . . . The present investigation is concerned with those social schemas that determine whether or not objects are thought of as belonging together." Ss grouped 9 different objects on a neutral ground, in any way they wanted. The results indicated that response sets determined the grouping, so much so, that in a 2nd phase of the

experiment the set was strong enough to cause S to deviate from reconstructing E's sorts.—G. Frank.

2973. Nass, Gilbert D. (Presbyterian-St. Luke's Hosp. School Nursing, Chicago) **Literature on measurement of the self concept: A sociologist's addendum.** *J. counsel. Psychol.*, 1961, 8(4), 368.—Reference is made to a considerable body of writing and research on the self-concept within the field of sociology, particularly the work of Kuhn.—E. R. Oetting.

2974. Stephenson, W. (U. Missouri) **"Ideal" types.** *Psychol. Rec.*, 1962, 12, 9-16.—Century old debate exists concerning the possible status of types (society, personality, etc.) as "ideas or hypotheses or acceptable science or not." Another subscribes to Max Weber's point of view that ideal types are conceptual and "primary abstractions from social and historical phenomena . . . at best elements of a social science." The subjective constructions which have subsequently developed in the social sciences "can be brought to terms with truly scientific procedures . . . along Q-methodological lines."—R. J. Seidel.

CULTURE & CULTURAL RELATIONS

2975. Bharucha-Reid, Rodabé P. (U. Oregon) **Appearance and reality in culture.** *J. soc. Psychol.*, 1962, 57(1), 169-193.—A critical appraisal of some cross-cultural methods, utilizing as an example one in a series of studies of foreign students (Indian, Japanese, Mexican, and Swedish) in the United States. It is pointed out that a noncomparative, ahistorical and "hollow man" approach leads to studies wanting in experimental design, a misrepresentation of a foreign culture, and a neglect of significant variables. The responsibility of the social scientist in not permitting misrepresentation of alien cultures which lead to the detriment of student exchange programs, technical assistance, and international relations is discussed. It is argued that those dealing with the "minds of men" can no more afford a lack of responsibility than those experimenting in the biological or physical sciences.—Author abstract.

2976. Clauss, L. F. (Oberursel, Taunus, Germany) **Blick in die arabische Welt.** [A look into the Arabic world.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 174-183.—The observations made during the trip to study various sociological aspects of current Arab countries are reported here in a semi-literary style. Personal impressions are discussed, theoretical speculations advanced concerning the effect upon the geographical, political, and religious factors upon various Arabic nations.—V. J. Bielewskas.

2977. Crowther, Betty. (U. Wisconsin) **Note on religious group differences in interaction profiles: A replication study.** *Psychol. Rep.*, 1962, 10(2), 459-464.—Protestants and Jews were compared on behavior scores during 5-person discussion sessions and on self- and peer-ranking data. Ss were college students: 25 Protestants, 20 Jews, and 5 Catholics. Differences were not significant but were consistent with data reported by Stimson (see 35: 2132). The suggestion is made that Protestants are more socially-oriented and that Jews are more task-oriented.—B. J. House.

2978. Das, J. P. (Utkal U., Cuttack, India) **Ethnocentrism and stereotypes among Santhals.**

J. soc. Psychol., 1962, 57(1), 79-84.—Santhals, an aboriginal tribe inhabiting Midnapore, West Bengal, were interviewed in order to elicit information about their stereotypes, parent-child relationships, authority pattern, etc. It was found that they were quite democratic and rational. They did not like the educated Hindus who live around them. Nevertheless, they have accepted many Hindu ideals and borrowed their dress and ornaments from the Hindus.—*Author abstract.*

2979. Epstein, Charlotte. **Intergroup relations for police officers.** Baltimore Md.: Williams & Wilkins, 1962. ix, 194 p. \$3.25.—Conflicts between groups and between individuals because they are members of groups are analyzed from psychological, sociological, and anthropological viewpoints. The significance of racial, religious, and nationality differences and their effects on prejudice, discrimination, and human nature are explored. Suggestions for further reading, problems to solve, and cases to analyze are given in this basic text and workbook.—*C. W. Page.*

2980. Kardiner, A., & Ovesey, L. **The mark of oppression: Explorations in the personality of the American Negro.** Cleveland, O.: World Publishing (Meridian), 1962. xix, 396 p. \$2.25.—A paperback edition of a book originally published in 1951 (see 26: 233).

2981. Meyer, E. (von Ossietzky-Str. 1, Göttingen, Germany) **Zur Begründung einer völkerpsychologischen Methode.** [A new method for the assessment of national character.] *Psychol. Beiz.*, 1962, 7 (1), 54-72.—Various examples of the necessity for collecting characteristic criteria describing the very essence of a foreign people are given. To avoid indulging in precipitous and subjective judgments, a method is developed capable of systematically assessing the specific forms of behavior and ways of life of foreign people. (English & French summaries)—*H. J. Priester.*

2982. Norbeck, Edward; Walker, Donald E., & Cohen, Mimi. (Rice U.) **The interpretation of data: Puberty rites.** *Amer. Anthropologist*, 1962, 64, 463-485.—A large-scale, cross-cultural comparison of male initiation ceremonies, offering specific interpretation to account for presence and absence of the rites plus generalizations on the significance of the rituals, has recently been published by Whiting and collaborators. Here, Whiting's methods and interpretations are examined, and the question of validity is discussed. There appear to be few accounts of exotic cultures that provide adequate data to go beyond the series of hypotheses as to key assumptions concerning the existence of affective ties and psychological conflicts. It seems evident that the loose category of events included in puberty rites cannot be explained by any single set of circumstances or by reference to any one theory such as the analytic interpretation of the edipus complex.—*R. L. Sulzer.*

2983. Pasamanick, Benjamin. (Columbus Psychiatric Inst. & Hosp., O.) **Comparative psychological studies of Negroes and whites in the United States: A clarification.** *Psychol. Bull.*, 1962, 59(3), 243-247.—Dreger and Miller (see: 35: 4875) criticize a paper by Pasamanick (see: 21: 948) in terms of sampling and skin color estimates. This paper is an answer to these criticisms and a general discussion of the issues involved.—*W. J. Meyer.*

2984. Reynaud, Pierre-Louis. **Psychologie du peuple tunisien.** [The psychology of the people of Tunisia.] *Rev. Psychol. Peuples*, 1961, 16(4), 368-377.—Observations concerning attitudes and abilities of the people of Tunisia with respect to the economic and political development of a new state.—*N. B. Gordon.*

2985. Rosenthal, Erich. (Queens Coll., Flushing, N. Y.) **Jewish fertility in the United States.** *Eugen. Quart.*, 1961, 8(4), 198-217.—The fertility rates of Jews in the United States is compared with Protestants and Catholics and analyzed with respect to urban-rural residence, education of the mother, occupation and income of the father, and compared with Canadian and British statistics. The article concludes with some discussion of family planning practices.—*S. G. Vandenberg.*

2986. Schwitzgebel, R. (Brandeis U.) **The performance of Dutch and Zulu adults on selected perceptual tasks.** *J. soc. Psychol.*, 1962, 57(1), 73-77.—12 Dutch-speaking and 12 Zulu Ss were tested in a laboratory situation on several perceptual tasks. All Ss were male residents of South Africa between the ages of 19 and 25 with less than 6 years of formal education. The tasks included: length estimation of simple geometric figures, matching size of circles, estimation of time passage, reporting autokinetic effects, and locating Gottshalt embedded figures. Zulus were shown to underestimate figures and time significantly more than Dutch Ss. Most notable, however, was the relative inability of Zulus to locate embedded figures. The author concludes "... that certain perceptual organizations are characteristic of cultural groups, that even relatively 'simple' processes may be affected by environmental conditions, and furthermore that some of the perceptual skills may not be reacquired even after extensive education."—*Author abstract.*

2987. Wolfe, John B., & Horn, Paul. (U. Mississippi) **Racial friction in the deep south.** *J. Psychol.*, 1962, 54(1), 139-152.—In an attempt to ascertain how racial tension originates, detailed descriptions of personal involvement in inter-racial altercations were obtained from more than 1000 Negroes and whites. The Ss were native to a region wherein the 2 races were about equally numerous. The data were categorized and presented in frequency tables showing race and sex comparisons. Occurrence of friction at the individual level was not sufficient to explain racial animosity.—*Author abstract.*

SOCIAL STATUS & STRUCTURE

2988. Coleman, J. (Johns Hopkins U.) **Comment on Harrison White, "Chance Models of Systems of Casual Groups."** *Sociometry*, 1962, 25(2), 172-176.—"White [see 37: 3000] has made explicit a wide range of processes, all giving rise to the same equilibrium distribution as our initial process, for systems of freely-forming groups. His paper also clarifies and corrects a number of confusions and inaccuracies in our paper. We believe the process we postulated more nearly conforms to what goes on in many systems of freely-forming groups than do the alternative processes he proposes. But our view is a biased one, and clearly it is necessary to carry out some detailed observations, to learn just what processes are in fact operative. By direct estimation of joining and leaving rates for different-sized groups

and in different population densities, it would be possible to learn what kinds of parameters do in fact govern systems such as these."—*H. P. Shelley.*

2989. Haller, A. O., & Wolff, Carole Ellis. (Michigan State U.) **Personality orientations of farm village, and urban boys.** *Rural Sociol.*, 1962, 27(3), 275-293.—"The results of the present study provide a clear demonstration of the hypothesis that personality orientations are related to residence."—*H. K. Moore.*

2990. Kammeyer, Kenneth. (U. California, Davis) **A comparative study of decision making in rural communities.** *Rural Sociol.*, 1962, 27(3), 294-302.—Analysis of attitudes in 110 small communities toward school district reorganization proposals that would have led to their losing their local high school, suggested that distance to be traveled by the children to the new school did not influence opposition, but that they were swayed by a feeling that their children would be less likely to win scholastic and athletic honors.—*H. K. Moore.*

2991. Photiadis, John D. (U. Minnesota) **Motivation, contacts, and technological change.** *Rural Sociol.*, 1962, 27(3), 316-326.—183 South Dakota farmers were motivated to seek contacts with agricultural agents and directly learn agricultural technology, more by social status than by money.—*H. K. Moore.*

2992. Queen, Stuart A. (Washington U.) **The function of social stratification: A critique.** *Sociol. soc. Res.*, 1962, 46(4), 412-415.—Some contemporary writers on social stratification discuss its "function" as "integrative, instrumental, and adaptive." Supporting evidence is usually lacking or unconvincing. Examination of historical data warrants challenging this current sociological orthodoxy.—*Journal abstract.*

2993. Sinha, A. K. P., & Upadhyaya, O. P. (Patna U., Bihar, India) **Eleven ethnic groups on a social distance scale.** *J. soc. Psychol.*, 1962, 57(1), 49-54.—This study was undertaken to find out the reactions of 400 male and 100 female students towards Indians, Americans, Burmese, Chinese, English, French, Germans, Japanese, Negroes, Pakistanese, and Russians, with respect to 6 categories of relationship on a modified form of the Bogardus Social Distance Scale. The findings were as follows: (a) According to favorable marriage reactions, the Indians secured the highest position, and the Chinese the lowest. The French, the Americans, and the English occupied 2nd, 3rd and 4th positions, respectively. (b) According to extreme negative reactions no S showed attitudes of antipathy toward the Indians. The attitude of maximum antipathy was displayed toward the Chinese. (c) The average social distance score of the female Ss was lower than that of the male Ss for all 11 ethnic groups. Male students, however, showed favorable and unfavorable attitudes toward the different ethnic groups in about the same preferential order as the females.—*Author abstract.*

2994. Smith, M. G. **West Indian family structure.** Seattle, Wash.: Univer. Washington Press, 1962. vii, 311 p. \$6.00.—From age and sex composition of sample households and other data gathered in 5 communities of the Caribbean area, both urban and rural, 3 types of family organization appear according to definition of mating and parenthood obligations: (a) marriage with male responsibility for

support of wife's offspring but not male residential obligation, (b) sexual union with female responsibility for children and no residential obligation for male, (c) consensual cohabitation with joint responsibility for issue during period of cohabitation. The presence or absence of each form depends on local cultural definition rather than ecological factors.—*L. M. Hanks.*

2995. Strauss, Murray A. (U. Minnesota) **Work roles and financial responsibility in the socialization of farm, fringe, and town boys.** *Rural Sociol.*, 1962, 27(3), 257-274.—Farm boys did more home chores than the other 2 groups, but fewer had outside jobs and were less often given the responsibility of providing for their own needs with the money they had.—*H. K. Moore.*

2996. Tannenbaum, Arnold S. (U. Michigan) **An event-structure approach to social power and to the problem of power comparability.** *Behav. Sci.*, 1962, 7(3), 315-331.—Power is defined within the framework of the event-structure theory of Allport. The relevance of this definition for comparing power manifest in a wide variety of situations is noted. The theoretical and empirical implications of this analysis are presented. (30 ref.)—*J. Arbit.*

2997. Taylor, Grady W. (Alabama Extension Service, Tuskegee Inst.) **An analysis of certain social and psychological factors differentiating successful from unsuccessful farm families.** *Rural Sociol.*, 1962, 27(3), 303-315.—Both successful and unsuccessful groups possess the same characteristics but in varying degrees.—*H. K. Moore.*

2998. Vaughan, Graham M. (Victoria U., Wellington, New Zealand) **The social distance attitudes of New Zealand students towards Maoris and fifteen other groups.** *J. soc. Psychol.*, 1962, 57(1), 85-92.—80 white, New Zealand-born students were tested for their social distance attitudes towards Maoris and 15 other national groups. It was found that the Ss' scores on a social distance scale correlated significantly with the extent to which the groups were judged to be physically similar to white New Zealanders. More social distance was accorded to Maoris than to members of groups of Northwestern European stock. This distance was increased when marriage preferences in particular were considered. These trends were attributed to the importance of race as a determinant of social distance.—*Author abstract.*

2999. Verma, R. M. **Development of a tool to appraise socio-economic status.** *J. psychol. Res., Madras*, 1962, 6(1), 35-38.—The schedule devised gives respondent's position on a 5-point scale. The reliability correlations (correlations between different parts and of the parts with the total schedule) range from .46 to .62. Correlation between scores on the schedule and assessors' ratings (validity indicator) was .289.—*U. Pareek.*

3000. White, H. (U. Chicago) **Chance models of systems of casual groups.** *Sociometry*, 1962, 25(2), 153-172.—"A wide variety of assumptions about arrival and departure processes are shown to lead to the same shape of equilibrium size distributions (the truncated Poisson) for a system of groups of people in casual interaction. Individual arrivals at and departures from groups are always assumed to be independent and to follow negative exponential

distributions in time. . . . we assume single-member groups can join other groups in the system, but we distinguish several mechanisms. We derive exact equations in state probabilities and develop approximate solutions for expected numbers of groups of given sizes. The subtle relations between model parameters and fitting constants are discussed in detail. Simons' paper on the Yule distribution has a different goal from ours, while Coleman and James' paper is misleading."—*H. P. Shelley.*

3001. **Williamson, Robert C.** (Los Angeles City Coll.) **Social class determinants of perception and adjustment in an adolescent and adult sample: El Salvador.** *J. soc. Psychol.*, 1962, 57(1), 11-21.—2 Salvadorean urban samples, adolescent ($N = 352$) and adult ($N = 97$), each divided into a lower and middle or upper socio-economic group, were given a questionnaire. In addition to social characteristics, the results for the adolescents included: (a) The upper group significantly estimated a larger income as necessary for membership within a given class. (b) Prestige ratings of 20 occupations agreed with other national samples and showed no class differences. (c) Projections of happiness to individuals and marriages about which the S knew showed significantly lower ratings by the lower class and by females. Marriages were rated as being unhappier than individuals. Similar differences were found for the adult sample but not significantly so. (d) Differences, although insignificant, were found in the images of the past, present, and future. The study is possibly most important for its apparently successful application of the questionnaire method in a culture previously considered off-limits to this technique because of the supposed lack of integrity in Ss' responses.—*Author abstract.*

ATTITUDES & OPINIONS

3002. **Berger, Peter L.** (Hartford Seminary, Conn.) **The precarious vision.** New York: Doubleday, 1961. 238 p. \$3.95.—The solid structure of social existence is usually taken for granted until some experience may alter the perspective to see this society as a fragile tissue of man-made conventions. Looking at our society with this precarious vision, sociologist Berger shows how this view may liberate us from bondage to the social fictions so staunchly upheld by the institutions of our society. Religion as a social institution gives an illusion of certainty to the dramatic fictions, adding its sanction to the bad faith of moral self-deception as in capital punishment, segregation, and war. The Christian faith is not religion in this sense, but joins with the anti-religious critique of atheism in unmasking the social fictions with truer perception. Christian faith because it is redemptive reveals society as comedy, in which men are stripped of their social roles and pretensions to transcend deadly earnestness in hope and joy.—*P. E. Johnson.*

3003. **Blood, Robert O., Jr., & Nicholson, Samuel O.** **International dating experiences of American women students.** *Marriage fam. Liv.*, 1962, 24(2), 129-136.—99 female students at the University of Michigan who had dated a foreign student at any time in the past, were interviewed to ascertain their motivation for this dating. Neither parental rebellion nor a crusade against prejudice were impor-

tant motivational factors in these students' international dating.—*L. Shatin.*

3004. **Brenner, Leon Oscar.** (Boston U.) **Hostility and Jewish group identification.** *Dissert. Abstr.*, 1961, 22(4), 1248.—*Abstract.*

3005. **Brown, L. B.** (U. Adelaide, England) **A study of religious belief.** *Brit. J. Psychol.*, 1962, 53(3), 259-272.—In an empirical study of religious belief, measures of strength of belief in an Australian student population were compared with beliefs in other areas and with personality and attitudinal variables. The correlation matrix shows that the religious belief measures belong together and that religious belief has its best relationships with institutionalization and denomination on the one hand and with authoritarianism on the other. The personality measures of anxiety were found to be related to dogmatism in opinionative and factual matters. In this way Thouless' finding that religious belief statements are ascribed to more strongly than are statements of fact has been confirmed, and extended. It is concluded that religious belief is a relatively isolated cognitive system requiring strong social support for its maintenance.—*Journal abstract.*

3006. **Dean, D. G., & Reeves, J. A.** (Dennison U.) **Anomie: Comparison of a Catholic and a Protestant sample.** *Sociometry*, 1962, 25(2), 209-212.—"Some 60 years ago Durkheim suggested that Protestants exhibited a greater degree of anomie than Catholics. A sample of 160 Catholic college women and 160 Protestant college women was drawn, with 75.6 per cent ($N = 121$) and 84.4 per cent ($N = 135$) responses, respectively. The mean anomie or normlessness score of Catholic women was 3.77, the Protestant 8.63, CR 11.55 (far beyond the .01 level of significance). Slight differences in the mean North-Hatt prestige score of the respondents' fathers apparently minimized the observed differences between the two groups."—*H. P. Shelley.*

3007. **Goldman, Morton; Warshay, Leon H., & Biddle, Ellen H.** (U. Kansas City) **Residential and personal social distance toward negroes and non-negroes.** *Psychol. Rep.*, 1962, 10(2), 421-422.—A modification of the Bogardus Social Distance Scale was administered to 13 samples, differing in age, education, sex, religion, and minority group membership, from the population of a midwestern city. All 13 samples preferred personal over residential contacts with Negroes, and residential over personal contact with Protestant, Catholic, and Jews. A possible interpretation of the results is suggested.—*B. J. House.*

3008. **Gorfein, David S., & Anderson, Larry M.** (Utah State U.) **A note on the validity of the Bernberg Human Relations Inventory.** *J. Psychol.*, 1962, 54(1), 65-68.—Bernberg has presented the Human Relations Inventory (HRI) as an instrument to measure conformity. In an attempt to validate the instrument, scores on the inventory were compared to the results of 2 influence experiments. Results only partially supported the HRI as a measure of conformity. The instrument failed to correlate with a measure of Social Desirability. It is suggested that since there is a need for a good paper-and-pencil test of conformity, further study of this instrument is warranted.—*Author abstract.*

3009. Isherwood, Stanley. (Dalhousie U., Canada) Effects of a clergy examiner on responses to a religious attitude questionnaire. *Bull. Maritime Psychol. Ass.*, 1962, 11(1), 7-10.—One group of 9th grade students who knew the examiner was a clergyman did not score differently from another group who did not know. Significant differences between sexes on the lie score found girls giving a better impression of themselves.—C. W. Page.

3010. Kundu, Gorachand. Recent method for attitude measurement. *J. psychol. Res.*, Madras, 1962, 6(1), 15-24.—The method devised by the author and called factor-dividing-rating is illustrated to show the utility of the weightage method, the graphic conditions, and the deduction of the formula.—U. Pareek.

3011. Levonian, Edward (U. California, Los Angeles) The use of films in opinion measurement. *Audiovis. Commun. Rev.*, 1962, 10(4), 250-254.—"To measure opinions about India, a film-questionnaire was prepared, with each item consisting of a motion picture scene of India in color, and an associated question. . . . This film-questionnaire was administered to 252 college students. A factor analysis of the items revealed 10 major factors." 8 factors were composed of depictive items and 2 of interpretive items. "Situations in which the film-questionnaire may have advantages over the conventional paper-questionnaire" are described.—R. E. Schutz.

3012. Lindenfeld, Frank. (Columbia U.) An analysis of political involvement. *Dissert. Abstr.*, 1962, 22(12), 4426-4427.—Abstract.

3015. Middleton, R., & Putney, S. (Florida State U.) Religion, normative standards and behavior. *Sociometry*, 1962, 25(2), 141-152.—Questionnaires administered anonymously to 260 male and 294 female, predominantly Protestant, white, middle class college students provide data assessing the relationship between religion and morality. S indicated if he felt he would violate his ethical principles if he violated each of a list of traditional and common social standards. Believers more than skeptics regard anti-ascetic actions as wrong and are less likely to engage in them. "They do not differ in how often they believe anti-social actions are wrong, or in how likely they are to engage in them. Nor do they differ in the frequency with which they violate their own standards—ascetic or social—by engaging in actions which they . . . regard as wrong." The assumption that religious sanctions are essential for basic social norms is not supported.—H. P. Shelley.

3016. Miner, J. B. (U. Oregon) Conformity among university professors and business executives. *Admin. Sci. Quart.*, 1962, 7(1), 96-109.—The upper strata of the business and academic worlds are considered in this paper. Using the Tomkins-Horn Picture Arrangement Test the author finds that conformity and deviance occur in both occupa-

tional groups, and that both are on the average less conforming than the typical college graduate. This relative nonconformity seems to be an artifact associated with age differences. Professors and executives are, in general, no less conforming than others when age is held constant.—V. S. Sexton.

3017. Rosenthal, R., & Persinger, G. W. (U. North Dakota) Let's pretend: Subjects' perception of imaginary experimenters. *Percept. mot. Skills*, 1962, 14(3), 407-409.—14 Ss were asked to pretend they had participated in an experiment in person perception and were asked to rate their imaginary E on 26 variables. Correlations between pretending Ss' ratings of their imaginary E and real Ss' ratings of their Es suggested the operation of a stereotype effect in Ss' perceptions of Es. Additional evidence suggested that stereotyping alone could not account for the obtained data and that use of ratings of Es by Ss was a meaningful and useful procedure.—W. H. Guertin.

3020. Shuval, Judith T. (Israel Inst. Applied Social Research) Ethnic stereotyping in Israeli medical bureaucracies. *Social. soc. Res.*, 1962, 46(4), 455-465.—The problem concerns a certain conflict between an assumed societal norm of relatively mild prejudice expressed by widespread stereotyping of North African immigrant, and the universalistic norm of the medical profession which proscribes a differential orientation to patients in terms of their ethnic background. Negative stereotyping is shown to increase when the strain of the medical bureaucratic system on the physician increases. It appears to be easier to maintain a universalistic norm within the context of a smaller bureaucracy, probably because the strain on the professional is less marked.—*Journal abstract.*

3021. Thompson, Daniel C., & Lief, Harold I. Development of attitudes in respect to discrimination. *Amer. J. Orthopsychiat.*, 1962, 32(1), 74-88.—A follow-up study of the 197 negro children representing all social classes in the urban south that were reported on in 1940 in Davis and Dollard's *Children of Bondage*. The assumption of the importance of "social class" and "color caste" as the principal explanatory factors is not sufficient. Rather, the ethos of each social world (middle class, matriarchy, gang, nuclear family, etc.) articulates a cardinal social value that tends to color the basic social attitudes of the individuals socialized in it. Because the real social worlds of the New Orleans negroes are closer to the white social worlds than to common stereotypes, desegregation and integration should proceed more easily.—R. E. Perl.

3023. Tisdale, John R. (Boston U.) *Psychological value theory and research: 1939-1960. Dissert. Abstr.*, 1961, 22(4), 1244.—*Abstract.*

3024. Toch, H. H., Rabin, A. I., & Wilkins, D. M. (Michigan State U.) *Factors entering into ethnic identifications: An experimental study. Sociometry*, 1962, 25(3), 297-312.—52 Jewish Ss and 60 non-Jewish Ss were asked to identify 60 systematically grouped portraits. Sortings were by intelligence, age, likability, and religion. Jewish pictures were comparatively accurately identified by all Ss, but more so by Jews. "Pictures classified as Jewish also tended to be sorted as bright, especially by Jewish Ss. There was less evidence of ethnocentricity in other sortings, apparently in part because of relatively stereotyped classifications by brightness and likability. These two evaluative dimensions were also highly correlated. Jewish pictures tended to be judged through the use of physiognomic cues, whereas Catholicism was frequently inferred from other categories (nationality); Protestantism tended to be a residual category."—H. P. Shelley.

3025. van den Bergh, Pierre L. (U. Natal, Durban, South Africa) *Race attitudes in Durban, South Africa. J. soc. Psychol.*, 1962, 57(1), 55-72.—A questionnaire study conducted among 383 urban middle-class South African students shows that racialism is strongest among Whites, though not absent among Africans and Indians. Whites express more social distance and less actual contact (particularly in situations implying equality) with non-Whites than non-Whites do with Whites. Stereotypes reveal a similarity between anti-Semitism and anti-Indian feelings. Africans and Indians are politically more radical than Whites, but all groups expect considerable political change, mostly through violence, and think that the racial situation has worsened in the last 20 years. The present study confirms previous studies by Pettigrew and MacCrone in showing that, of the Whites, Jews are least prejudiced and Afrikaners most prejudiced. All 3 studies indicate that anti-non-White attitudes of Whites are not generalized to the White out-groups.—*Author abstract.*

GROUP INFLUENCES

3026. Bennis, Warren G., & Peabody, Dean. (Massachusetts Inst. Technology) *The conceptualization of two personality orientations and sociometric choice. J. soc. Psychol.*, 1962, 57(1), 203-215.—Ss were rated on dependency (orientation to authority) and personalness (orientation to intimacy). It had been found that (a) the 2 extremes of these qualities may be combined in conflicted behavior, and (b) the 2 qualities are related, primarily through the relation of Dependents and Counterpersonals. Ss made a series of sociometric choices to test the hypothesis that people tend to select rather than reject those of similar personality. Results were in the predicted direction; the poorest results were obtained in the choices of the Counterpersonals and the Dependents.—*Author abstract.*

3027. Birney, Robert C., & Houston, John P. (Amherst Coll.) *The effects of creativity, norm distance, and instructions on social influence. J. Pers.*, 1961, 29(3), 294-302.—"Using a multivariate design, Ss were subjected to social influence by a two-man majority of their peers. Sixty freshman expressed their preference for paintings and were sub-

jected to uniform degrees of disagreement by the majority. Neither the size of discrepancy between the individual's prior judgment and that of the majority nor instruction differences had any effect on yielding. Ss high on creativity, as measured by Barron's devices, yielded least. All Ss showed considerable yielding, however, in direct opposition to the findings reported by Crutchfield . . . even though personal esthetic preferences were involved."—G. T. Lodge.

3028. Blake, Robert R., & Mouton, Jane Srygley. (U. Texas) *Comprehension of own and of out-group positions under intergroup competition. J. conflict Resolut.*, 1961, 5(4), 304-310.—193 Ss participated in a standard sequence of ingroup and intergroup activities. "During competition groups formed solutions to a problem. Adversaries were allowed sufficient time for clarification to produce the subjective feeling that they understood the two solutions equally well before an intergroup knowledge test was administered. The results demonstrate that misunderstandings in objective properties of solutions are directly related to one's membership affiliation. . . . We are suggesting, therefore, that win-lose judgments are difficult to accept in an emotionally mature manner, partly due to distortions in understanding which are closely linked to 'membership.'"—G. T. Lodge.

3029. Borah, Lee A., Jr. (U. Minnesota) *An investigation of the effect of threat upon interpersonal bargaining. Dissert. Abstr.*, 1961, 22(6), 2089.—*Abstract.*

3030. Borgatta, Edgar F. (Cornell U.) *A systematic study of interaction process scores, peer and self-assessments, personality and other variables. Genet. psychol. Monogr.*, 1962, 65, 219-291.—A revision of the Bales interaction scoring method is analyzed in a sample of 175 male college Ss observed in 5-person groups. Data replicating the analysis on 114 of the Ss in independently composed 3-person groups are then presented. The findings appear to indicate stability of the structure of interaction variables. Peer rankings (previously analyzed) appear to predict only in the area of dominance (activity or assertiveness), and self-rankings and self-ratings also predict in this area. Personality inventories have first order correlations that indicate significant relationship to activity or assertiveness, but in factor analysis this is minimized. Self-ratings are well related to the personality inventory scales, but self-rankings are not. In appendices, a frame of reference for research in the field of behavioral description is outlined, and detailed description of the revised category system and a protocol are presented.—*Author abstract.*

3031. De, B., & Sinha, J. P. *Topography of a group. J. psychol. Res., Madras*, 1962, 6(1), 9-14.—Results of sociometric choice data for a class of students of psychology are analyzed both for frequency and intensity of like and dislike judgments. Communication patterns and attractiveness of the group are also indicated.—U. Pareek.

3032. Fox, David J., & Lorge, Irving. (Columbia U.) *The relative quality of decisions written by individuals and by groups as the available time for problem solving is increased. J. soc. Psychol.*, 1962, 57(1), 227-242.—Lorge and others have reported that with 50 minutes available, individuals wrote better solutions to human relations problems than ad hoc groups. This study investigated whether or not this generalization is supported when more

time is available. The new data indicate that with more time, ad hoc groups write solutions as good as those written by individuals, before instruction in group dynamics and problem solving; and solutions better than those written by individuals after such instruction. The data also indicate a discrepancy between the ideas initially available, those discussed, and those included in the written group decision. This suggests the need for better techniques of problem solving, of evaluating ideas presented, and of reporting results, in group deliberation.—*Author abstract.*

3033. Goslin, D. A. (Russell Sage Found.) **Accuracy of self perception and social acceptance.** *Sociometry*, 1962, 25(3), 283-296.—"The theoretical position taken in this study is that social interaction is based on the accuracy of the participants' expectations about one another's behavior. Data from 19 groups of adolescent boys and girls tended to support the hypothesis that children who perceived themselves differently from the way they were perceived by the other members of the group, and/or were unable to predict how the other members of the group perceived them, would tend to be isolated from the group." Data were also gathered indicating that the rejected tended to overestimate themselves more, to show more self-conflict, and to have more variance in their received ratings.—*H. P. Shelley.*

3034. Heiss, J. S. (U. Connecticut) **Degree of intimacy and male-female interaction.** *Sociometry*, 1962, 25(2), 197-208.—Sex role differentiation was studied in 54 unmarried couples of varying degrees of intimate relationship. Each couple discussed their disagreements on certain issues attempting to come to some agreement. "As expected, males tended to dominate in the task sections of the Bales system, and females dominated in the positive reactions section. Contrary to expectations, the distribution of sections within the male group was not very different from that in the female group. With increasing intimacy the dominant sex in each section became less dominant. This trend reflects the fact that females who are opposed to male dominance act more consistently with this attitude in intimate groups than they do in casual relationships. Another relevant factor is that more people in the casual groups hold attitudes favoring male dominance."—*H. P. Shelley.*

3035. Hoffman, L. R. (U. Michigan) **A note on ratings versus choices as measures of group attraction.** *Sociometry*, 1962, 25(3), 313-320.—"Ratings and choices were compared for their equivalence as sources of data on members' attraction to their groups. Each member of four-person homogeneous and heterogeneous (with respect to personality) groups rated the other members of his group on liking and problem-solving ability and chose three people each from among his group and others on the same two bases at three different times. Correlations among the four derived indexes of attraction were higher between methods than between base of attraction for both individuals and groups and showed no regular changes over time."—*H. P. Shelley.*

3036. Hood, William Robert, & Sherif, Muzafer. (U. Oklahoma) **Verbal report and judgment of an unstructured stimulus.** *J. Psychol.*, 1962, 54(1), 121-130.—The question was raised as to whether the convergence of judgments toward a common norm obtained from Ss in an autokinetic situation was

merely a verbal compliance or it reflected their judgment of the extent of movement. An experiment was conducted in which Ss did not "commit" themselves in the presence of the plant, removing immediate "social pressure." Ss were exposed, as though accidentally, to the prescribed judgments (1"-5" range under one condition and 6"-10" range under the other). Ss gave judgments, after the social influence was removed, which were preponderantly within the respective range to which they were initially exposed thus showing the anchoring effect of conceptual categories under the stimulus condition of the experiment. This situation is contrasted with those at an opposite pole, in which determinants in the physical stimulus situation are predominant and discrepant social standards are introduced.—*Author abstract.*

3037. Kassarian, Waltraud M., & Kassarian, Harold H. (U. California, Los Angeles) **Conformity of judgment in a group situation.** *Psychol. Rep.*, 1962, 10(2), 491-494.—Perceptual judgments were indicated privately with paper and pencil by 97 undergraduates while 10 informed Ss attempted to influence judgments by publicly indicated choices including 67% wrong answers. Significantly more errors were made than by a control group of 20 Ss who performed the task without attempted influence. "The degree of conformity varied among individuals from no conformity to total yielding. However, . . . the greater percentage of the total group did not conform. This group approach proved workable and yielded results comparable to those obtained by Asch's individual approach."—*B. J. House.*

3038. Lutzker, Daniel R. (Norwich Hosp., Conn.) **Sex role, cooperation and competition in a two-person, non-zero sum game.** *J. conflict Resolut.*, 1961, 5, 366-368.—"Twenty pairs of subjects, heterogeneous in regard to sex, played a 30-trial, two-person, non-zero sum game. The game permitted both cooperation and competition to occur. It was hypothesized that sex role would influence the choices of Red (competitive) and Black (cooperative). . . . It was concluded that sex role did not influence cooperative and competitive behavior in this game."—*G. T. Lodge.*

3039. Myers, Albert Edward. (U. Illinois) **The effect of team competition and success on the adjustment of group members.** *Dissert. Abstr.*, 1961, 22(5), 1710-1711.—*Abstract.*

3040. Oeser, O. A., & Harary, Frank. (U. Michigan) **A mathematical model for structural role theory. Part I.** *Hum. Relat.*, 1962, 15(2), 89-109.—The basic concepts, postulates, elements, and relations sufficient for setting up a digraphic mathematical model for analysis of role structures as a collection of sets of relations on sets of persons, positions, and tasks respectively, are proposed. The context of role behavior is regarded as the total set of relations embodied in a structural role digraph. Appendices on the terminology of digraphs and a glossary are included.—*W. W. Meissner.*

3041. Olmsted, D. W. (Michigan State U.) **A developmental model of the social group.** *Sociol. Quart.*, 1962, 3, 195-207.—In a brief theoretical paper, Olmsted discusses the processes of model building, proposes a sequence of development for social groups, and evaluates his model against recognized criteria of model-building. He sees "the existence of a socially defined need for the product . . . of a social group"

and "the presence of potential members" as the necessary conditions of group formation. The important factor in group development is continuity of interaction which leads to mutual awareness, shared experiences, and stable relations—all of which eventually give rise to the properties of a mature group: group goals, interpersonal structures, perceptual consensus, group norms, and syntality.—*K. E. Davis.*

3042. Seaborne, A. E. M. (Brunel Coll., England) **Group influence on the perception of ambiguous stimuli.** *Brit. J. Psychol.*, 1962, 53(3), 287-298.—An attempt was made to relate the judgments made by Ss in a social pressure situation to the ambiguity of the stimulus being judged. Ambiguity values were assigned to the various stimuli on the basis of responses made by Ss to the stimuli when not exposed to social influence. It was found that conformity was not related to the ambiguity of the stimulus although individual certainty of correctness varied inversely and response time varied directly with ambiguity. It seems possible that this can be accounted for by assuming that the S's assessment of the difficulty of the judging task was used to rate the value of the group's opinion so that where it seemed that the possibility of arriving at a correct answer was less, the group's influence was less effective. The results indicate that conformity can only be expected to vary directly with ambiguity where the social influence is seen to derive from a source external to the immediate stimulus situation.—*Journal abstract.*

3043. Shears, Loyda Ada Mosier. (U. Hawaii) **The effect of variation in power pattern on the formation of coalitions in tetrads.** *Dissert. Abstr.*, 1961, 22(6), 2091.—*Abstract.*

3044. Shure, G. H., Rogers, M. S., Larsen, I. M., & Tassone, J. (System Development Corp., Santa Monica, Calif.) **Group planning and task effectiveness.** *Sociometry*, 1962, 25(3), 263-383.—"Newly formed groups, performing in a communication-restricted environment, are assigned a pressing task which requires group coordination and planning for efficient performance. Three conditions of opportunity for planning are analyzed for their effects on task efficiency, organizational development, and message interaction. When planning must take place concurrently with task activity, group members give up planning efforts although they may be in possession of suitable plans and be aware of their ultimate advantage. The mechanism by which task pressure seems to produce this result is generalized to account for some forms of panic behavior not adequately explained by existing concepts." Ss were 150 freshman and sophomore college students.—*H. P. Shelley.*

3045. Stotland, Ezra, & Cottrell, Nickolas B. (U. Washington) **Self-esteem, group interaction, and group influence on performance.** *J. Pers.*, 1961, 29(3), 273-284.—147 Ss received a Q sort measure of self-esteem. Then seated 6 at a time around a "Lazy Susan," Ss collected words by pairing syllables from lists provided. Each S collected a different category. By design, in $\frac{1}{2}$ the groups there was much interchange of words via the Lazy Susan, and but little interchange in the other $\frac{1}{2}$. Ss were then given a task of mentally counting recurrences of a designated syllable in a spoken passage of Hindi. Findings: (a) "Ss expected to do better on the syllable counting task actually performed better on it, and evaluated their performances higher when the first

S performing . . . was perceived to do well" (b) "This difference obtained more for Ss of low self-esteem." (c) "The difference did not occur significantly more under conditions of high interchange of words than low."—*G. T. Lodge.*

3046. Suppes, Patrick, & Krasne, Franklin. (Stanford U.) **Applications of stimulus sampling theory to situations involving social pressure.** *Psychol. Rev.*, 1961, 68(1), 46-59.—An interaction situation is conceived of as one in which each member of a group provides stimuli and reinforcements for every other member of the group. Pressure on an individual to modify his choices is treated as a stimulus discrimination situation. A Markovian model is presented to account for the transitional effects of stimulus and reinforcement events on probability of response. An experiment provides data with which the predictions from the model can be compared, and close agreement is found.—*C. N. Uhl.*

3047. White, David Glen. (U. Maryland) **Sex bias in experimental juries.** *Dissert. Abstr.*, 1961, 22(6), 2092.—*Abstract.*

3048. Wolfe, Donald McCreery. (U. Michigan) **Social influence toward unanimous group decision in various group authority structures.** *Dissert. Abstr.*, 1961, 22(4), 1289.—*Abstract.*

3049. Zajonc, Robert B. (U. Michigan) **The effects of feedback and probability of group success on individual and group performance.** *Hum. Relat.*, 1962, 15(2), 149-161.—140 members of the Strategic Air Command were divided into 20 groups of 7 members. The Group Reaction Time Apparatus was used to measure success under conditions of direct feedback (10 groups) or confounded feedback (10 groups). Results indicate that individual performance improves on a group task and that improvement is greatest for a difficult group task when information on performance of all members and the group as a whole is fed back. Confounded feedback gives only slight improvement. Individuals performing at high rates were more sensitive to feedback than to task difficulty, but the opposite was found for members performing at low rates.—*W. W. Meissner.*

3050. Zajonc, Robert B. (U. Michigan) **A note on group judgments and group size.** *Hum. Relat.*, 1962, 15(2), 177-180.—Statistical problems related to estimation of relation between the validity of group judgments and group size are discussed. Mean correlation between individual rankings, when negative, decreases with increases in group size as long as the average intercorrelation among the judges is positive.—*W. W. Meissner.*

3051. Zander, A., & Curtis, T. (U. Michigan) **Effects of social power on aspiration setting and striving.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 63-74.—"Individual Ss were observed in a situation similar to the one used by Rotter (1942) for studying the level of aspiration, while they were to perceive themselves as members of a team which was not physically present. In two experimental conditions . . . the Ss were provided standards of individual performance, for a series of trials, said to originate in others members of their team. Events were so arranged that Ss . . . did not attain the performance levels put before them by the others. . . . Assumptions were made that: (a) scores are evaluated in terms of internal levels of aspiration; (b) referent social pres-

asures more strongly influence . . . internal levels of aspiration than do coercive . . . and (c) a discrepancy between an internal level of aspiration and an obtained score generates forces to reduce this discrepancy." Results confirmed the hypotheses.—G. Frank.

LEADERSHIP

3052. Kipnis, David, & Lane, William P. (USN Personnel Research Activity, Washington, D. C.) **Self-confidence and leadership.** *J. appl. Psychol.*, 1962, 46(4), 291-295.—The object of this study was to examine the relationship between lack of confidence in one's leadership ability and reliance upon passive leadership techniques to cope with supervisory problems. 77 Navy petty officers were given a questionnaire containing 20 supervisory problems and were asked to evaluate the desirability of each of 5 ways of solving each problem. Ss also evaluated how satisfied they were with their leadership abilities. Principal findings were: (a) Ss were highly consistent in the extent to which they endorsed each of 5 approaches to correcting performance, (b) there was a correlation of .52 between endorsing the use of administrative procedures to solve the problem and informally asking a superior to solve the problem, and (c) Ss who lacked confidence in their leadership abilities were significantly less willing to hold face-to-face discussions with subordinates and significantly more often endorsed both referring the subordinate to a superior and relying upon the use of administrative rules to solve the supervisory problems.—*Journal abstract.*

3053. Lowry, Richie P. (Chico State Coll.) **The functions of alienation in leadership.** *Sociol. soc. Res.*, 1962, 46(4), 426-435.—Recent studies of mass society have often implicitly assumed a connection between alienation and the breakdown of effective leadership processes. A study of changing public life in a small northern California community indicated that alienation is a complex result of social and ideological factors. A typology of leadership was devised utilizing the varying forms of alienation from local community life. This typology suggested that alienation is ultimately functional in providing for the heterogeneous leadership types necessary to maintain effective leadership interaction in a rapidly changing small community in mass society. Ineffective leadership results from disequilibrium in the community's leadership structure rather than from alienation, per se.—*Journal abstract.*

3054. Maier, N. R. F., & Hoffman, L. R. (U. Michigan) **Group decision in England and the United States.** *Personnel Psychol.*, 1962, 15(2), 75-87.—Student groups in England and the United States and groups of English supervisors were compared on a role-playing case involving the group decision method of leadership. Results indicated that English students tend to dominate the discussion more, and to consider seniority less important than the Americans; the English supervisory groups tend to fall between both. English groups felt greater satisfaction with the solution when group decision was used, as contrasted to the foreman's domination of the discussion. It is concluded that "the opportunity offered by group decision to participate in making decisions affecting one's life has appeal for all peoples, regardless of cultural differences in prevailing practices."—A. S. Thompson.

LANGUAGE & COMMUNICATION

3055. Cohen, A. M., Bennis, W. G., & Wolkon, G. H. (Case Inst. Technology) **The effects of changes in communication networks on the behaviors of problem-solving groups.** *Sociometry*, 1962, 25(2), 177-196.—The effects of changes in the communication networks of problem-solving groups on efficiency, organization, and satisfaction were studied using 40 5-member groups randomly formed from paid, volunteer, undergraduate students. Under one condition the group was changed from a more efficient to a less efficient but more satisfying network; in the other condition the reverse obtained. "The results revealed that prior experience influenced how groups organized for solving problems, how certain they were of their answers, how satisfied they were, and whether or not leadership was continuous from one network to another."—H. P. Shelley.

3056. Dietze, Alfred G. (Michigan State U.) **Meaning clusters of common adjectives in the Finnish language.** *J. soc. Psychol.*, 1962, 57(1), 33-48.—Cross cultural comparisons of semantic structures have used material translated from the language of the E into the comparison language. This may lead results in favor of the hypothesis of isomorphy. The present study attempts comparison under the restriction that test materials are independently generated in the languages compared. From 16,000 adjectives given as responses to 80 nouns by Finnish Ss, 60 pairs of bipolar adjectives were selected on the basis of frequency. These were used with 280 Finnish Ss in a forced-choice paired-comparison experiment in which all pairs of adjectives were judged in terms of all other pairs as to similarity of meaning. The results formed an order 60 matrix of agreement indices of Ss marking items in the same direction. Estimates of phi for 40 variables were subjected to factor analysis rotated to simple structure. Results of the word association experiment compared with Thorndike-Lorge frequency indices and Osgood's similarly derived scales support isomorphy in the similarity of descriptive concepts between the 2 languages. The factor analysis yielded 5 factors, the dominant one clearly evaluative, but the Finnish overtones. Others bear less resemblance to previous findings.—*Author abstract.*

3057. Drieman, G. H. J. **Differences between written and spoken language.** *Acta psychol., Amsterdam*, 1962, 20(1), 36-57.—8 psychology students spoke and wrote on analogous themes. Analysis shows written language to contain: shorter texts, longer words, fewer words of one syllable, more words of more than one syllable, more attributive qualities, a more varied vocabulary. The results support other studies.—G. Rubin-Rabson.

3058. Dubois, Jean, & Guilbert, Louis. **La notion de degré dans le système morphologique du français moderne.** [The expression of degree in the morphology of modern French.] *J. Psychol. norm. pathol.*, 1961, 58(1), 57-64.—A discussion of social and lexical aspects of prefixes denoting degrees of intensity, e.g., hyper-, hypo-, quasi-, ultra-, super-, etc.—M. L. Simmel.

3059. Jacobson, E., Deutschmann, Paul J., Kato, Hidetoshi; Girard, Alain; Noelle, Elisabeth; Schmidtchen, Gerhard; Brouwer, Marten; Ander-

son, Bo; Eisenstadt, S. N. **Communication and information.** *Int. soc. Sci. J.*, 1962, 14(2), 251-348.—A series of loosely interrelated articles on the current status of communication research, together with some reports of research. In general, there is a continuing interest in the processes of group communications deriving, in large measure, from American research and theory in this field, and from extending this research into other cultures.—*A. Barclay.*

3060. Kern, Karl Robert. (U. Wisconsin) **Effects of economic value orientation upon perceptual and attitudinal responses to a persuasive written communication.** *Dissert. Abstr.*, 1961, 22(6), 2079-2080.—*Abstract.*

3061. Peel, E. A. (U. Birmingham) **Learning and meaning.** *Bull. Brit. Psychol. Soc.*, 1962, 48, 1-9.—In his Presidential address to the British Psychological Society the author outlines a vectorial theory involving a type of meaning, distinguished from semantic and syntactic meaning, which is named "conceptual meaning." Such meaning is defined as "the relation between the sign and other signs of similar significates." Experimental evidence in support of the theory is detailed.—*C. C. Kiernan.*

3062. Sines, J. O. (Washington U. School Medicine) **An indication of specificity of denotative meaning based on the semantic differential.** *J. gen. Psychol.*, 1962, 67, 113-115.—One aspect of semantic differential ratings is studied which significantly reflects the differences in frequency of usage and, therefore, the number of dictionary meanings which are attributable to several English language words. It is suggested that the semantic differential measure discussed (deviation from the midpoint) is a useful measure of specificity of denotative meaning.—*Author abstract.*

3063. Swank, Theron Edwin. (Indiana State U.) **An analysis of the social diffusion of an audio-visual message through a church congregation.** *Dissert. Abstr.*, 1961, 22(4), 1287.—*Abstract.*

3064. Turbayne, Colin Murray. (U. Rochester) **The myth of metaphor.** New Haven, Conn.: Yale Univer. Press, 1962. viii, 224 p. \$6.00.—Metaphor as a semantic device is inspected in terms of its psychological and philosophical implications. It is shown to be an artificial language, often misleading, and psychologically unsound. The author attempts to expose categorical confusion. The book has a twofold aim: to "explode the metaphysics of mechanism by exposing mechanism as a case of being victimized by metaphor," and to show that "the metaphysics of mechanism can be dispensed with." In lieu of metaphor the author proposes an alternative model which treats the events of nature as elements of language, and shows how the linguistic metaphor sheds light on the concrete problem of vision and visual perception, left obscure by the mechanical metaphor. The main theme of the book is "that we should constantly be aware of the presence of metaphor, avoiding being victimized by our own as well as by others," with a secondary theme, that because of the infusion of metaphor into our psychological orientation to problems the distinction between the bona fide problem and the "mythology" relating to the problem are so tenuous, that a distinction is drawn only with the greatest difficulty.—*Paul D. Leedy.*

Speech & Linguistics

3065. Duijker, H. C. J. **Spreekssituatie en taalstructuur.** [Speech situation and language structure.] *Gawein*, 1962, 10(4), 191-203.—Language should be conceived as a normative system. Methods of speech study rather than language psychology include: speech behavior resulting from the situation in which the S finds himself, the Osgood technique, careful or stereotyped speech, and the individual choice of speech symbols. The aim is a special psychological code based on mathematics, measurement of meaning, stressing rather than evaluating facts, and using quantitative terms. This code would describe man as a collection of scale point positions in an n-dimensional space.—*J. A. Lückner.*

3066. Fletcher, Samuel G. (Utah State U.) **Speech as an element in organization of a motor response.** *J. speech hear. Res.*, 1962, 5(3), 292-300.—By means of tests of simple reaction time, 6 adult and 6 child Ss were separated into 2 matched groups at each age level. One group at each level was instructed to release a response key when a correct stimulus light was lit. The other group was instructed to release the key and say "Go" when the correct stimulus was given. Results showed no significant differences within age level or among age levels. When a decision element was imposed, reaction time was extended. Comparisons with speech as the independent variable demonstrated speech to be a significant asset for the child subjects and an apparent deterrent for the adults.—*M. F. Palmer.*

3067. Hollien, Harry. (U. Florida) **Vocal fold thickness and fundamental frequency of phonation.** *J. speech hear. Res.*, 1962, 5(3), 237-243.—3 males and 3 females chosen on the basis of age, absence of vocal disorders, ability to produce specified vocal tone, and representing low, medium, and high pitched voices were required to produce 6 vocal frequencies with a normal pitch register while lamina-grams were made. 3 of these levels were common to the men only, 3 to the women only, and the remaining 3 to all Ss. The mean thickness of vocal folds was systematically reduced as the fundamental frequency of phonation was raised. Vocal fold thickness constitutes an important determinant of fundamental frequency of phonation.—*M. F. Palmer.*

3068. Matoré, G. **Les dimensions dans le vocabulaire français d'aujourd'hui.** [Spatial dimensions in modern French vocabulary.] *J. Psychol. norm. pathol.*, 1961, 58(2), 157-169.—A phenomenological analysis of spatial concepts, based in part on the writings of modern French novelists and journalists.—*M. L. Simmel.*

3069. Munson, W. A., & Karlin, J. E. (Bell Telephone Lab., Murray Hill, N. J.) **Isopreference method for evaluating speech-transmission circuits.** *J. Acoust. Soc. Amer.*, 1962, 34(6), 762-774.—This paper describes a modification of the paired comparison technique for deriving a 1-dimensional scale for rating speech transmission systems on the basis of listener preferences. Experiments have been conducted for a large number of speech transmission conditions on the transmission preference unit (TPU) scale. Equal preference contours were determined on speech level-noise level planes for several different frequency bands. The data suggest that the basic

requirements of transitivity may be satisfied for many types of transmission conditions.—*A. M. Small, Jr.*

Mass Communication

3070. Hess, Robert D., & Goldman, Harriet. (U. Chicago) Parents views of the effect of television on their children. *Child Develpm.*, 1962, 33(2), 411-426.—A nonrandom sample of 99 mothers were interviewed to elicit attitudes and feelings toward various aspects of television program content, tele-viewing, and the effect of television upon children. A small proportion of the mothers were enthusiastic about children's programs or were significantly worried about the effects of television on their children. There was a general feeling that the TV networks have basic standards and good intensions. Recommendations are made for greater concern in the parents about TV.—*W. J. Meyer.*

3071. Tannenbaum, Percy H., & Lynch, Mervin D. Sensationalism: Some objective message correlates. *Journalism Quart.*, 1962, 39(3), 317-323.—An attempt was made to uncover the message attributes that appear to be linked to sensationalism. 61 Ss read 24 passages and rated each passage against semantic differential scales representing 3 dimensions of the judgment of sensationalism. Each S also judged the concept "Sensational news" against the same set of scales. Factor analysis of the 41 resultant variables indicated one general sensationalism factor. 3 stylistic variable clusters were also found.—*D. E. Meister.*

ESTHETICS

3072. Adcock, C. J. (Victoria U., Wellington, New Zealand) Aesthetics. *J. gen. Psychol.*, 1962, 67, 83-87.—An attempt is made to explain aesthetic enjoyment as based on affective experiences of a particular type. The distinguishing features of the experiences are that they are not directly related to survival utility and that they attach to perception (perceptual pleasure for its own sake). The experiences depend upon innate sensory factors, the achievement of perceptual meaning, the nature of our form concepts, and conditioning. Although beauty is not regarded as an absolute attribute, the view taken here does not preclude the acceptance of aesthetic standards by the human species and does not require that such standards be simply current majority opinion.—*Author abstract.*

3073. Alluisi, E. A. (Human Factors Research Dept., Lockheed-Georgia Co.) Rater-rater reliabilities in judging musical performances. *Percept. mot. Skills*, 1962, 14(1), 145-146.—Rater-rater reliability coefficients were computed from the over-all performance grades given woodwind students by different music instructors. Instructors of woodwinds and brass agreed quite well with each other (average r about +.850), but not so well with instructors of strings and percussion (r s ranging between -.338 and +.599).—*W. H. Guertin.*

3074. Beldoch, Michael. (Columbia U.) The ability to identify expressions of feelings in vocal, graphic, and musical communication. *Dissert. Abstr.*, 1961, 22(4), 1246.—*Abstract.*

3075. Beranek, L. L. (Bolt Beranek & Newman, Cambridge, Mass.) Seeking communication: Musical-acoustic vocabulary. *Sound*, 1962, 1(4), 22-26.

—Phrases used in the subjective description of musical sound are defined in terms of physical parameters.—*A. M. Small, Jr.*

3076. Ekman, Goesta, & Kuennapas, Teodor. (U. Stockholm) Scales of aesthetic value. *Percept. mot. Skills*, 1962, 14(1), 19-26.—An aesthetic variable was measured by the "direct" psychophysical method of ratio estimation and the "indirect" method of pair comparisons. In addition, a category scale was obtained. Both the interval scale constructed from pair comparisons on the assumption of Thurstone's Case V, and the category scale, are logarithmic functions of the ratio scale. In the case of the indirect method, the result means that the assumption of constant variability should be replaced by an assumption of proportional variability, if the ratio scale is regarded as a criterion.—*W. H. Guertin.*

3077. Farnsworth, Paul R. (Stanford U.) Elite attitudes in music as measured by the Cattell space method. *J. Res. music Educ.*, 1962, 10, 65-68. "... the best way to learn elite attitudes is still to question the elite. The Cattell space method, when employed with the Britannica, was shown to be quite invalid. Even when used with musical encyclopedias, it must be regarded as a rather inferior method for studying such attitudes. Yet it does select the musicologists' top choices reasonably well in this specialized type of encyclopedia."—*D. S. Higbee.*

3078. Knapp, R. H., & Ehlinger, H. (Wesleyan U.) Stylistic consistency among aesthetic preferences. *J. proj. Tech.*, 1962, 26(1), 61-65.—"There seems to be a general stylistic consonance among (1) restless and troubled music, (2) turbulent and diffuse abstract art, and (3) curvilinear architectural forms." A 2nd constellation is composed of elements essentially opposed to the aforementioned.—*A. F. Greenwald.*

3079. Knapp, Robert H., McElroy, Lowell R., & Vaughn, James. (Wesleyan U.) On blithe and melancholic aestheticism. *J. gen. Psychol.*, 1962, 67, 3-10.—This study examines the hypothesis that the tendency to prefer joyous as opposed to melancholic aesthetic expressions is directly related to attitudes toward conscience and the severity of conscience as seen by the individual. Testing instruments consisted of the Knapp-Green Abstract Art Test, a collection of 40 modern abstract art paintings, and 3 "metaphor scales" for Death, Conscience, and Self Image, taken from the Knapp Metaphor Scales. A moderate but highly significant correlation was obtained between preference for melancholic paintings and tendency to describe Conscience in hostile, ego-alien terms. Significant correlations were also obtained between preference for images describing Death and Self Image.—*Author abstract.*

3080. Kozina, T. M. (Mechnikov State U., Odessa, USSR) Rol' obratnoi afferentatsii v slukhovom vospriatii ritma. [Role of back "afferentation" in the auditory perception of rhythm.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 2, 81-84.—Study of the effect of motor accompaniment, which is out of tune with a rhythmic stimulus, on the perception and reproduction of rhythm. Ss were 20 college students (age 18-28). Auditory rhythm was provided by a metronome and the motor accompaniment consisted in pressing a telegraph key. The main result was that under these conditions both the perception and the reproduction of rhythm are quite

inaccurate. The motor accompaniment when in phase with the rhythm is indispensable for the accuracy of the perception and reproduction of a rhythmic stimulus.—*A. Cuk.*

3081. Malrieu, P. **Témoignages du romancier sur la psychologie ouvrière.** [The novelist's contribution to the psychology of the worker.] *J. Psychol. norm. pathol.*, 1961, 58(2), 171-191.—The personality, every day life, and problems of the worker as depicted in the novels of the last 100 years.—*M. L. Simmel.*

3082. Neher, A. (East Los Angeles Coll., Calif.) **A physiological explanation of unusual behavior in ceremonies involving drums.** *Hum. Biol.*, 1962, 34(2), 151-160.—A comparison of reports of behavior occurring in drum ceremonies with observations from laboratory studies on the effects of rhythmic stimulation reveals the 2 situations to be apparently similar in respect to stimulus conditions and responses.—*P. Swartz.*

3083. Saunders, F. A. **Violins old and new: An experimental study.** *Sound*, 1962, 1(4), 7-15.—Attempts to measure physical parameters which relate to the perception of musical tones produced by violins are reported. An effort is made to discern what factors differentiate between "good" and "bad" instruments.—*A. M. Small, Jr.*

3084. Ward, W. Dixon. (Subcommittee on Noise, Los Angeles, Calif.) **On the perception of the frequency ratio 55:32.** *J. Acoust. Soc. Amer.*, 1962, 34(5), 679.—"The fact that untrained listeners categorize the musical interval between two tones having a frequency ratio of 55:32 as being a major sixth is shown to be a most reasonable outcome on the basis of present knowledge.—*A. M. Small, Jr.*

3085. Wing, Herbert D. (Sheffield Training Coll., England) **A revision of the Wing Musical Aptitude Test.** *J. Res. music Educ.*, 1962, 10, 39-46.—". . . how a test was subjected to an intensive critical survey, how this led to a revision, and further, how the revision has been and is still being subjected to critical investigation to determine its limits of accuracy."—*D. S. Higbee.*

3086. Wright, Benjamin, & Rainwater, Lee. (U. Chicago) **The meanings of color.** *J. gen. Psychol.*, 1962, 67, 89-99.—A semantic differential and regression study of the connotative meanings of color among 3660 West German adults. Judgments of 50 3-inch squares of surface color were obtained on 48 adjective pairs with 20-70 Ss rating each color. Raw score principal component analysis of the 48 × 50 matrix of average ratings gathered 80% of the covariation into 6 meaning dimensions, "happiness," "showiness," "forcefulness," "warmth," "elegance," "calmness." The effects of hue, lightness, and saturation on these meanings were estimated by linear regression. Multiple correlations of color connotations with perceptions ranged from .57 to .87. Saturation had the most, and hue the least linear effect. Greater saturation and lightness both increased "happiness" and "showiness." Greater saturation also increased "forcefulness," "warmth," and "elegance," while greater lightness decreased "forcefulness," "warmth," and "calmness." For hue, greater blueness increased "elegance" and "calmness" but decreased "warmth."—*Author abstract.*

3093. Secord, Paul F., & Backman, Carl W. **Personality theory and the problem of stability change in individual behavior: An interpersonal approach.** *Psychol. Rev.*, 1961, 68(1), 21-32.—An interpersonal theory is advanced according to which the locus of behavioral stability and change lies in an interpersonal matrix of 3 components: an aspect of the self-concept of S, S's interpretation of those elements of his behavior related to that aspect, and S's perception of related aspects of the person with whom he is interacting (O). Congruency among these components is threatened by the changing nature of interpersonal relations due to normative patterns of change, fortuitous changes, and the fact that O's means of establishing congruency for himself often create incongruencies for S. When incongruencies arise, a variety of interpersonal processes act either to restore congruency without change in self or behavior, or to form a new congruent matrix which does involve a change in self or behavior.—*P. Rempel.*

NEW TESTS & TEST CONSTRUCTION

3094. Birkman, Roger Winfred. (U. Texas) **Development of a personality test using social and self-perception inventories.** *Dissert. Abstr.*, 1961, 22(6), 2061-2062.—*Abstract.*

3095. Kameny, Aaron. (Montefiore Hosp., NYC) **50 Card Test: Clerical Task as a screening device for organic brain damage. Report on preliminary findings.** *Arch. phys. Med. Rehabil.*, 1961, 42, 785-790.—A clerical task is described involving the alphabetic filing of cards (50 Card Test or the Clerical Task). It is a short, easily scored test which may prove of potential value as: (a) a screening device for patients suspected of having organic brain disease, (b) an objective measure of recovery from organic disease, the patients' clinical improvement to be correlated with scores obtained on the Clerical Task, (c) a means of assessment of intellectual functioning in children beginning with the age of 10 years and the 5th elementary grade.—J. R. Royce.

3096. Lord, Frederic M. (Educational Testing Service) **Estimating norms by item-sampling.** *Educ. psychol. Measmt.*, 1962, 22(2), 259-267.—Norms may be better obtained through item-sampling instead of sampling examinees. Data supporting this thesis were obtained through the use of 70 items from a vocabulary test given to 1000 college seniors. The items were divided into 10 subtests, which were then given to 10 different groups of students. The item-sample estimate of the mean was closer to the mean than were 7 of the 10 examinee-sample estimates. Lord acknowledges that the method assumes that performance on an item does not depend on the context in which it occurs. This assumption can not apply to speeded tests. Other information that is needed to determine the value of item-sampling is discussed.—W. Coleman.

3097. Rey, André. (U. Geneva) **Interprétation de dessins et développement psychologique.** [Sketch interpretation and psychological development.] Neuchâtel, Switzerland: Delachaux & Niestlé, 1962. 374 p.—A new test termed "The Sketch Interpretation Test" is described and analyzed at length. It is a projective test of meaning as differentiated from a projective test of affective state and is claimed to be useful in investigating the significance and the structure that individuals give to certain visual material that allows a wide latitude of organization. The visual material, included in an appendix, consists of 20 black and white line diagrams graded somewhat in degree of ambiguity. The test is said to be useful for any age from 2 years upwards and for any degree of intellectual development. Extensive norms are provided for both adults and children. Also included is a voluminous glossary of themes ordered according to substance and quality. Detailed instructions for administration and scoring are given.—G. H. Mowbray.

3098. Rosen, Albert. (U. Maryland) **Development of the MMPI scales based on a reference group of psychiatric patients.** *Psychol. Monogr.*, 1962, 76(8, Whole No. 527), 25 p.—A total group of 714 patients were grouped into several diagnostic categories with $\frac{1}{3}$ of the total categorized as psychiatric patients-in-general. These groups were used in an effort to reduce the positive correlation between the MMPI scales by means of a new scale based on selective items from the MMPI that provides significant differentiation between the heterogeneous "psychiatric patients-in-general" and a homogeneous group with a specific diagnosis. A 2nd phase was concerned with the comparison of the new scales with the original MMPI in differentiating general normal

Ss from those with clinical mental disability. The new scales developed were labelled Conversion Reaction (Cr), Anxiety Reaction (Ar) and Paranoid Schizophrenia (Pz). Cr, Sm, and Pz were highly intercorrelated; Pz + 1 K was relatively independent of the others; and Pz, Dr, and Ar overlapped very little with other scales. The use of an abnormal reference group does reduce the positive intercorrelation in the MMPI.—M. A. Seidenfeld.

3099. Taylor, Frederick Richard. (U. Utah) **Two new psychological tests for diagnosing brain damage.** *Dissert. Abstr.*, 1962, 22(12), 4414.—Abstract.

3100. Waters, L. K., & Wherry, R. J., Jr. (USN School Aviation Medicine) **The preference index and responses to forced-choice pairs.** *Personnel Psychol.*, 1962, 15(2), 99-102.—Self-descriptive responses of 164 flight students to 30 forced-choice pairs, matched on an index of job importance but differing on discrimination values, were available from an earlier study. Differences between index values for statements in each pair were obtained for the preference index, job importance index, and discrimination index, and were correlated with frequency of choice of the nondiscriminating statements. A substantial relationship was found between PI differences and frequency of choice, even when the effects of apparent and real validity differences were removed. Comparison of results with previous studies suggests that the degree of bias in the situation plays an important role in the value of the PI as a matching index.—A. S. Thompson.

3101. Webster, Harold. (U. California, Berkeley) **Item sampling as a sufficient but unnecessary requirement for precise mental testing.** *Educ. psychol. Measmt.*, 1962, 22(2), 321-324.—In psychological measurement, the data used is not the item itself but rather numbers derived from the responses. To increase the measurement variance between persons, uniform item scoring and valid item content are needed. Increasing the heterogeneity of the item means does not appear to help improve test reliability.—W. Coleman.

3102. Wolfson, W., & Bachelis, L. (Middletown State Hosp.) **An abbreviated form of the WAIS Verbal scale.** *J. clin. Psychol.*, 1960, 16(4), 421.—The Verbal scale records of the WAIS test results of 100 patients, age 16-72, were examined. "By using selected items on each of the subjects of the verbal scale of the WAIS it was shown that a considerable saving of time could be had while yet retaining the reliability of the variety of functions of the original verbal scale."—V. J. Bieliauskas.

TEST STANDARDIZATION & EVALUATION

3103. Alimena, B. (Manhattan Coll.) **A note on norms for scatter analysis on the Wechsler intelligence scales.** *J. clin. Psychol.*, 1961, 17(1), 61.—The earlier published method by the same author dealing with the analysis of scatter on the Wechsler scales was brought up to date in this paper in view of the revision of the Wechsler test. A table is presented showing the method of establishing norms for the study of scatter, taking in consideration Wechsler's method of deviation IQs, and providing z scores.—V. J. Bieliauskas.

3104. Bodwin, R. F., & Bruck, M. (Child Guidance Clinic, Flint, Mich.) **The adaptation and validation of the Draw-A-Person Test as a measure of self concept.** *J. clin. Psychol.*, 1960, 16(4), 427-429.—In an attempt to devise a quantified self-concept scale for the DAP Test, 13 characteristics of drawings thought to reveal the self-concept of the drawer were devised on the basis of inspection of many drawings. The DAPs of 60 Ss, age 10 through 17 were rated on a 5 point scale for each of the 13 characteristics. The Ss were also rated on self-concept in a psychiatric interview. The DAP ratings were correlated with the interviewer ratings. The DAP self-concept scale was found to be valid (.01 level of confidence).—*V. J. Bielianskas.*
3105. Bouvard, C. **Le Test des Pyramides de Couleurs de Pfister: Comparaison des résultats d'une population française avec ceux d'une population allemande correspondante.** [The Pfister Colored Pyramids Test: Comparison of results of a French population with those of a corresponding German population.] *Rev. Psychol. appl.*, 1961, 11(4), 269-278.—The Pfister Colored Pyramids Test was given to a French population of 76 girls aged 13 and 14, and to a German population of 100 girls of 13-15. In percentage of utilization of each of the colors, for 7 there was no significant differences, for 3 there were differences significant at the .02 level; and for 1, at the .05 level. Rank order correlations between the lists of colors by frequency of use was .90. The 2 distributions were judged similar in view of the differences in composition and culture of the samples. Additional data are given as to syndromes, number of colors used, and structure.—*W. W. Wattenberg.*
3106. Callahan, R. J. (Detroit, Mich.) **Validity of the Children's Anxiety Pictures.** *Percept. mot. Skills*, 1962, 14(1), 166.—Children's Anxiety Pictures responses of children in a psychiatric hospital were compared with those from school children. The mean total of threatening objects perceived was higher for the psychiatric group.—*W. H. Guertin.*
3107. Corman, Michel. **Étude clinique des formes réduites de l'échelle d'intelligence de Wechsler pour enfants.** [Clinical study of short forms of the WISC] *Rev. Psychol. appl.*, 1962, 12(1), 33-48.—The protocols for 19 girls and 81 boys, aged 6-15, examined at Corman's Centre Médico-Pédagogique were studied to determine the correlation of various short forms with the global IQs of the WISC. The results for several 4-scale and 5-scale versions are given. It is concluded that the best short form would consist of 3 subtests from the verbal section and 3 from the performance section, as follows: Information, Arithmetic, Similarities, Block Design, Object Assembly, and Picture Completion. Profiles for a number of clinic cases are presented. This short form gives a saving between 20 and 40 minutes. Its use is contra-indicated with remedial reading cases or where there is excessive scatter.—*W. W. Wattenberg.*
3108. Eysenck, S. B. G. (U. London, England) **The validity of a personality questionnaire as determined by the method of nominated groups.** *Life Sci.*, 1962, No. 1, 13-18.—"A study is reported of the validity of the Maudsley Personality Inventory, using the method of nominated groups. Judges nominated persons of their acquaintance whose behaviour showed them to be outstandingly high or low on either one or both of the dimensions of extraversion-introversion and stability-neuroticism. Questionnaire answers of these subjects on the Maudsley Personality Inventory, which purports to measure these two dimensions were found to be related at very high levels of significance to the nominations they had received indicating considerable validity for the Inventory in question."—*C. T. Morgan.*
3109. Knapp, Robert R. (USN, San Diego, Calif.) **The validity of the objective-analytic personality test battery in Navy settings.** *Educ. psychol. Measmt.*, 1962, 22(2), 379-387.—The O-A Battery yielded higher predictive validity *r*'s than the MMPI and the Guilford-Zimmerman for 2 samples. The 1st consisted of 315 Navy enlisted men and the 2nd was a group of 81 Marine Corps officer pilots. Several different criteria were employed. The O-A Battery did not add significantly to a Mult. R for predicting cognitive criteria.—*W. Coleman.*
3110. Kodman, F., Jr., & McDaniel, E. (U. Kentucky) **Further investigation of the reliability of an MMPI scale for auditory malingerers.** *J. clin. Psychol.*, 1960, 16(4), 451.—"Sixty-five suspected malingerers, (selected on the basis of poor response reliability and a threshold elevation 15 db. or greater on a battery of hearing tests), were matched with 65 hard of hearing nonmalingerers. The subjects were administered the 68 (MMPI) items of the unvalidated malingering scale. A total of 19 significant items remained in the scale as a result of the cross-validation."—*V. J. Bielianskas.*
3111. Koppitz, Elizabeth. (Endicott Public Schools, N. Y.) **The Bender Gestalt Test for children: A normative study.** *J. clin. Psychol.*, 1960, 16(4), 432-435.—A normative study was undertaken to examine the Revised Scoring System for the Bender Gestalt Test for children and to observe certain development trends in Bender Gestalt drawings by children, ages 5.10 to 10.5. The drawings of 1055 school children were evaluated and mean scores and standard deviations were given for each age group. The results suggested that, "the Bender Gestalt differentiates both outstanding and immature visual motor perception up to age 8, thereafter it no longer discriminates at the upper end." Girls appeared to mature a little earlier than boys in visual motor expression, but this observation was not supported statistically. The revised scoring system was included.—*V. J. Bielianskas.*
3112. Kramer, Josefina. (Gurzelnasse 14, Solothurn, Switzerland) **Die Zuverlässigkeit des Kramer-Tests.** [Reliability of the Kramer test.] *Heilpädagog. Werkbl.*, 1962, 31(3), 100-108.—The Kramer Intelligence Test was repeated, usually after 3-3 years, on 220 Swiss school children. In 159 relatively stable children the average change was 2.49 IQ points, either up or down; in 61 difficult children the mean change was 6.04 points. Changes tended to be greater when test and retest were not administered by the same person. The author concludes that of the 220 Ss 79.09% showed a stable IQ (changing 5 points or less), 14.55% showed losses and 6.36% rises in IQ.—*D. F. Mindlin.*
3113. Lachmann, F. M., Bailey, M. A., & Berrick, M. E. (VA, New York Regular Office) **The relationship between manifest anxiety and clinicians' evaluations of projective test responses.** *J. clin.*

Psychol., 1961, 17(1), 11-13.—10 psychologists were given the Bender-Gestalt Test and the Draw-a-Person Test productions of 10 patients to rank in terms of the magnitude of anxiety which they observed in the drawings. Judgments of the psychologists were compared with the findings of the MA scale which had also been administered to the patients. "An inverse relationship between the psychologists' rankings from the projective tests and the MAS was noted. The results suggest either a lack of a unitary concept of anxiety among these clinical psychologists or that the two projective tests used in this study do not measure anxiety along the same continuum as the MAS."—*V. J. Bieliauskas*.

3114. Locke, E. A., & Hulin, C. L. (Cornell U.) **A review and evaluation of the validity studies of Activity Vector Analysis.** *Personnel Psychol.*, 1962, 15(2), 25-42.—The 18 available validation studies of Activity Vector Analysis, a short personality measure widely used for personnel selection in industry, were examined to see whether any of them demonstrated predictive validity. Various methods of validation were used in the studies. Analysis of weaknesses in procedures or interpretations of the data led the authors to conclude that the AVA has failed to demonstrate any practical utility as a selection device in industry.—*A. S. Thompson*.

3115. McGuirl, D., & Moss, C. S. (State Hosp. No. 1, Fulton, Mo.). **An indirect validation study of the Draw-A-Person Test through the cartoons of William Steig.** *J. proj. Tech.*, 1962, 26(1), 88-95.—Groups of normals, deaf Ss, and clinical psychologists matched Steig cartoons with captions and selected those matches about which they were most and least confident. The drawings were selected as highly meaningful caricatures of "body language." Ss correctly made a significant number of matches, although this appears to be correlated with intelligence. Psychologists did not demonstrate a greater capacity for this type of behavior. The implications is that the meanings of figure drawings are not universally understood even by a group sophisticated in projective assessment.—*A. F. Greenwald*.

3116. Maxwell, A. E. (Maudsley Hosp., U. London) **Inadequate reporting of normative test data.** *J. clin. Psychol.*, 1961, 17(1), 99-101.—Wechsler failed to include in the WISC manual the means, standard deviations, and frequency distributions for his raw scores. A study was conducted with the purpose of illustrating that such an omission presents a problem in the practical usage of the WISC. A group of psychiatric patients, children 9½-10½ years of age, 49 boys and 36 girls, were given the WISC. Although the results were roughly alike for boys and girls, the tabulation of means and standard deviations of the scaled scores suggested a greater dispersion than the expected value of 3 on the WISC. But since this data is not available in the manual, a direct check to verify this hunch was not possible. A detailed study confirmed the assumption that the transformation from raw to scaled scores on the psychiatric population was not linear. The author criticizes the inadequate reporting of normative data of tests.—*V. J. Bieliauskas*.

3117. Moreigne, F., & Senecal, J. **Résultats d'un groupe d'enfants africains au Terman-Merrill.** [Results of a group of African children on the Merrill-Terman.] *Rev. Psychol. appl.*, 1962, 12(1),

15-32.—During a period of 3 years the authors used a modification of Cesselin's French adaptation of the Merrill-Terman with African children. They tested 67 at 3, 202 at 4, 258 at 5, and 114 at 6 years of age. Average IQ's were 95 at 3, 93 at 4, 89 at 5, and 87 at 6 years of age. Details of the distributions are given. The correlations of IQs at 3 with those at 4 was .68; between 4 and 5, .76; between 5 and 6, .79; between 3 and 5, .62. Additional tables present longitudinal results for several Ss. The test, with minor adjustments, proved useful in an African milieu.—*W. W. Wattenberg*.

3118. Pandey, R. E. **Standardisation of Jalota's General Mental Ability Test on the Nepalese population.** *J. psychol. Res., Madras*, 1962, 6(1), 39.—The distribution of test scores and the reliability coefficients (.83-.89) shows that the test is applicable to Nepalese conditions. Grade norms for Classes 8, 9, and 10 are given.—*U. Pareek*.

3119. Wiens, A. N., & Banaka, W. H. (Oregon State Hosp.) **Estimating WAIS IQ from Shipley-Hartford scores: A cross validation.** *J. clin. Psychol.*, 1960, 16(4), 452.—Cross-validation of Sines and Simmons data reported earlier. 140 Ss comparable to their Ss were given the WAIS and the Hartford Test. The diagnostic categories of the group included all major psychiatric classifications. The correlation obtained between the scores of the 2 tests was .80, significant at .01 level. The regression equation and conversion table proposed by Sines and Simmons were also supported by this study. "It can be concluded that the Shipley-Hartford Scale may be used profitably in a hospital setting as a substitute for WAIS when economy of administration is desired."—*V. J. Bieliauskas*.

INTELLIGENCE & CREATIVITY

3120. Ammons, R. B., & Ammons, C. H. **How to foster genius: McCurdy extended.** *Proc. Mont. Acad. Sci.*, 1962, 21, 138-144.—"A learning analysis was made of the conditions found by McCurdy to characterize the childhoods of male geniuses. Applications of these principles were then made, suggesting ways to facilitate the development of genius. It is not at all surprising that genius develops so seldom in our current cultural environment."—*C. H. Ammons*.

3121. Ammons, C. H., & Ammons, R. B. **How to prevent genius: McCurdy revisited.** *Proc. Mont. Acad. Sci.*, 1962, 21, 145-152.—An evaluation of the results of a survey of cultural attitudes judged by McCurdy to be closely related to the development of genius in pre-adult years is given. Means of rewarding intellectually-creative behavior were contrasted with pressures toward conformity.—*Author abstract*.

3122. Ammons, R. B. **Toward a technology of intellectual originality and creativity.** *Proc. Mont. Acad. Sci.*, 1962, 21, 153-159.—Examination of 4 assumptions basic to a technology of creativity and work done in the laboratory, in classes, and in the general professional area at Montana State University supports the feasibility of developing a technology of creativity.—*C. H. Ammons*.

3123. Biggs, J. B. (National Found. Educational Research) **The relation of neuroticism and extraversion to intelligence and educational attainment.** *Brit. J. educ. Psychol.*, 1962, 32(2), 188-195.—The

article criticizes Eysenck's theory of condition-ability and a study supposedly based upon it by Lynn and Gordon. (30 ref.)—*B. T. Jensen.*

3124. Clément, F. (Centre de Gérontologie de l'Association Claude Bernard, Paris, France) **Réflexions a propos de la prétendue supériorité des femmes dans les épreuves de vocabulaire.** [Considerations as to the presumed superiority of women on vocabulary tests.] *Rev. Psychol. appl.*, 1962, 12 (2), 83-96.—From an aged population composed of 465 men and 307 women, groups were matched as to age, cultural level, intellectual ability, and memory. The vocabulary test from the Wechsler scale and the Binois-Pichot Vocabulary Test were administered. The results of the many comparisons led to the conclusion that on neither test was there any superiority for either sex. Correlations on the order of .65 were found between the vocabulary tests on the one hand and cultural level, intellectual ability, and memory on the other. Finally, a table was developed showing the IQ's corresponding to scores on the 2 vocabulary tests for populations similar in age and cultural level to the population used in the study.—*W. W. Wattenberg.*

3125. Digiammo, J. J., & Ebinger, R. D. (Fergus Falls State Hosp., Minn.) **The net-weighted H-T-P score as a measure of abstraction.** *J. clin. Psychol.*, 1961, 17(1), 55.—30 psychiatric patients of the receiving ward of a mental hospital, including schizophrenics neurotics, emotionally unstable personalities, and a few dull normal were given the House-Tree-Person Test (H-T-P) and the multiple-choice Proverbs Test. Both tests were scored according to the usual procedures and were correlated by the Spearman rank order correlation method. Correlations between the various H-T-P test scores and the Proverbs Test scores ranged from .67 to .55, the highest scores being net weighted, raw G, and good score. These findings suggested a positive correlation between the H-T-P scores and the Proverbs Test but they failed to support the hypothesis that the H-T-P net weighted score could be used as a specific indicator of abstraction.—*V. J. Bieliauskas.*

3126. Elley, W. B., & MacArthur, R. S. (U. Alberta) **The Standard Progressive Matrices as a culture-reduced measure of general intellectual ability.** *Alberta J. educ. Res.*, 1962, 8(1), 54-65.—For a representative sample of 271 Edmonton Grade 7 pupils, the Standard Progressive Matrices (1956) was found to: correlate significantly less with socioeconomic status than the CTMM—Language, have a high loading of 0.78 on a general intellectual ability factor and no loading on group factors emerging from the tests used, have a moderate relationship with school marks (.56) and achievement tests (.38 to .44), have reliability (internal consistency) of .87, and was as stable and predictive of school marks from Grades 3 to 7 as the CTMM.—*G. M. Della-Piana.*

3127. Estes, Betsy Worth; Curtin, Mary Ellen; DeBurger, Robert A., & Denny, Charlotte. (U. Kentucky) **Relationships between 1960 Stanford-Binet, 1937 Stanford-Binet, WISC, Raven, and Draw-a-Man.** *J. consult. Psychol.*, 1961, 25(5), 388-391.—Scores on the 1937 S-B, the 1960 S-B, and the WISC, were found to be comparable in an above-average group of school children. Age factor did not account for test discrepancies but there were highly significant discrepancies at superior level. Raven and

DAM estimates relate moderately well to the other tests.—*E. R. Oetting.*

3128. Hayes, Keith, J. (Loma Linda U. School Medicine) **Genes, drives, and intellect.** *Psychol. Rep.*, 1962, 10(2), 299-342. (Monogr. Suppl. No. 2-V10)—A review of "the literature relevant to a motivational-experiential theory [of intelligence] which proposes that: (a) manifest intelligence is nothing more than an accumulation of learned facts and skills, and (b) innate intellectual potential consist of tendencies to engage in activities conducive to learning, rather than inherited intellectual capacities, as such. These tendencies are referred to here as experience-producing drives (EPDs)." Among topics discussed in relation to the theory are brain damage, synthetic intelligence, language, mental growth, and some traditional views of intelligence. (155 ref.)—*B. J. House.*

3129. Hersch, C. (Cambridge Guidance Cent.) **The cognitive functioning of the creative person: A development analysis.** *J. proj. Tech.*, 1962, 26 (2), 193-200.—Findings support the hypothesis that both relatively mature and primitive processes are more available to the creative individual as compared with noncreative normals. Primitive operations among creators are more adaptive and capable of productive expression while primitive thinking among schizophrenics serves pathological ends.—*A. F. Greenwald.*

3130. Lessing, Elise Elkins. (Illinois Inst. Juvenile Research) **A note on the significance of discrepancies between Goodenough and Binet IQ scores.** *J. consult. Psychol.*, 1961, 25(5), 456-457.—". . . the discrepancy between Goodenough IQ's and IQ's on a standard test of intelligence can be as dramatically large in a nonclinic population as in the disturbed groups studied by Hinrichs [see 9: 4712] and Hanvik [see 27: 7773]."—*E. R. Oetting.*

3131. Lynn, R. (U. Exeter) **Comments on the article by J. B. Biggs.** *Brit. J. educ. Psychol.*, 1962, 32(2), 196-199.—Biggs misunderstands Eysenck's theory of conditionability as well as some of Lynn's work.—*B. T. Jensen.*

3132. Remondino, C. **Recherche sur la signification du facteur numérique.** [Study of the meaning of the numerical factor.] *Rev. Psychol. appl.*, 1962, 12(2), 63-81.—Thurstone and Coombs have given contrasting conceptions of the nature of Factor N. The former regards the factor as measuring ability to execute arithmetical operations; the latter, to work with any symbolic systems if they are perfectly known. A factor analysis was conducted on a battery of tests already known to measure the numerical factor plus a specially constructed test involving operations with non-numerical symbols. The tests were given to 5 populations in Italy representing groups ranging widely as to age, education, and class, and totaling 1130 Ss. Tables give the correlational matrices, the details of the factor analyses, and data on the populations. The results are interpreted as confirming Coombs' position.—*W. W. Wattenberg.*

3133. Solomondis, D. **Contribution a l'étude de l'efficiencia intellectuelle des malades mentaux.** [Contribution to the study of intellectual ability of mental patients.] *Rev. Psychol. appl.*, 1962, 12(2), 97-104.—2 tests, one similar to the Progressive Matrices and the other to Bennett's mechanical com-

prehension were administered to 3 populations: 164 normal individuals, 164 having motoric weaknesses, and 95 with mental disorders. Tabulations were made comparing the groups for each test on number of responses, number and percentage of omissions, good answers, and poor answers. In the mentally disordered population there was a high frequency of inadequate responses. Their intellectual dysfunctioning appeared to be characterized by relative inertia and incompleteness. Hypotheses are advanced as to causes of this situation.—*W. W. Wattenberg.*

PERSONALITY MEASUREMENT

3134. **Arnhoff, Franklyn N., & Damianopoulos, Ernest N.** (U. Miami) **Self-body recognition: An empirical approach to the body image.** *Merrill-Palmer Quart.*, 1962, 8(3), 143-148.—21 male college students recognized with 100% accuracy their own bodies, devoid of clothing, facial and situational cues, from among a series of 7 photographs, matching each other and ranging from maximal to minimal similarity. Degree of certainty as to correctness of choice varied.—*E. L. Robinson.*

3135. **Bauer, Raymond A.** (Harvard U.) **London revisited.** *Psychol. Rep.*, 1962, 10(2), 348.—A discussion of criticisms of the author's work by I. D. London (see *Psychol. Rep.*, 1961, 9, 615-621).—*B. J. House.*

3136. **Bendig, A. W.** (U. Pittsburgh) **Improving the factorial purity of Guilford's restraint and thoughtfulness scales.** *J. consult. Psychol.*, 1961, 25(5), 462.—". . . the moderate correlation between the regular R and T scales was due to the factorially impure item content of the scales."—*E. R. Oetting.*

3137. **Carlson, Earl R.** (Michigan State U.) **Motivation and set in acquiring information about persons.** *J. Pers.*, 1961, 29(3), 285-293.—Ss in 2 experimental groups responded to the Edwards Personal Preference Schedule (EPPS) and read 3 personality descriptions composed of items related to the EPPS need scales. One group read the descriptions to choose which they would "most like as a friend," while the 2nd group read the same descriptions to choose which "would make the best leader in a social group on campus." Ss then wrote as complete a description of each personality as they were able, and the responses were scored for accuracy of recall for each need. Results: (a) Ss recalled more characteristics related to their high intensity needs; (b) the number of Ss recalling each characteristic was positively related to the perceived desirability of the characteristic for the set; (c) high-recall Ss were significantly higher in Affiliation and Heterosexuality scores than low-recall Ss; (d) information related to Dominance or Heterosexuality was recalled more frequently than that related to Change, Succorance, or Intraception.—*G. T. Lodge.*

3138. **Centers, R.** (U. California, Los Angeles) **An examination of the Riesman social character typology: A metropolitan survey.** *Sociometry*, 1962, 25(3), 231-240.—A personal interview survey was conducted with a cross section of adults in greater Los Angeles to study the distributive characteristics of the Riesman social character typology. Respondents were administered a test of inner-other-directedness (see 37: 3148), and their scores were related to several variables to test the validity of Riesman's asser-

tions that other-directedness is most prevalent in the middle-class and is increasing. "Inner-other-directedness was found to be normally distributed, without appreciable correlation with socio-economic indices, but with other-directedness being more common in younger people ($r=.16$). The latter finding . . . [supports] Riesman's claim that other-directedness is becoming more prevalent in America."—*H. P. Shelley.*

3139. **Cerbus, G., & Nichols, R. C.** (Purdue U.) **Personality correlates of picture preferences.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 75-78.—Preference for certain structural dimensions of pictures (color, degree of abstract representation, human-non-human content) was related to personality factors (as measured by 3 inventories). Ss were VA psychiatric patients and college students. Of the 189 intercorrelations of variables for the 224 Ss, 22 were statistically significant; these are presented and discussed.—*G. Frank.*

3140. **Crokes, T. G., & Keller, Anna.** (St. John's Hosp., Aylesbury, England) **Rorschach card rejection and IQ.** *J. clin. Psychol.*, 1960, 16(4), 424-426.—A replication of Tamkin's report of negative correlation between IQ and number of Rorschach cards rejected by male patients. 293 adult female psychotic patients and 217 children were included. The IQ's were obtained with the Wechsler-Bellevue, Form I, WISC and the Revised Stanford-Binet tests. The results confirmed Tamkin's findings for all Ss, children and adults.—*V. J. Bieliauskas.*

3141. **Cunningham, Anne.** (U. Kentucky) **Relation of sense of humor to intelligence.** *J. soc. Psychol.*, 1962, 57(1), 143-147.—The relation of humor (as measured by the Raley Cartoon Test) to intelligence (as measured by the Thurstone Test of Mental Alertness) was examined. Ss were 70 freshmen high school girls, all within a one-year age range. The only significant correlation was a $-.25$ with the total score of the Thurstone Test. These results do not agree with previous studies on the relationships between humor and intelligence. A possible explanation as to this discrepancy may be that the Raley Cartoon Test is a more exact test of sense of humor than previous tests and, therefore, less influenced by intelligence. The disagreement may also be due to the variety of procedures utilized as measurements of intelligence and humor in other studies. The relations of the Raley test with other types of intelligence tests should be studied.—*Author abstract.*

3142. **Dale, C., Logan, R., & Ammons, R. B.** **Some interview characteristics of persons placing high value and persons placing low value on intellectual activity.** *Proc. Mont. Acad. Sci.*, 1962, 21, 113-119.—"Sixteen highly selected Ss participated in an interview study of correlates of extremely high and extremely low scores on the Cultural Information Survey, a scale measuring level of value placed on intellectual activity. Each S answered 35 questions. No important differences related to two different interviewing methods were detected. A number of differences between Ss who scored high (placed high value on intellectual activity) and Ss who scored low (placed little value on intellectual activity) were found. The definite differences between Ss scoring extremely high and those scoring extremely low on the CIS suggest that interviewing can provide a great deal of useful information about the experiential cor-

relates of value placed on intellectual activity."—C. H. Ammons.

3143. Diers, Carol Jean. (U. Washington) Social desirability and acquiescence in response to personality items. *Dissert. Abstr.*, 1961, 22(5), 1709.—Abstract.

3144. Dightman, C. R., & Fahrion, S. L. An experimental approach to the study of empathy. *Proc. Mont. Acad. Sci.*, 1962, 21, 124-131.—"The results of this experiment demonstrate that this empathy quiz . . . measures some significant factor in interpersonal relations. Future work is planned to validate the quiz further, making sure that empathy, as it is objectively defined, is the factor actually being measured."—C. H. Ammons.

3145. Dunnette, M. D., McCartney, Jean; Carlson, H. C., & Kirchner, W. K. (U. Minnesota) A study of faking behavior on a forced-choice self-description checklist. *Personnel Psychol.*, 1962, 15(2), 13-24.—This study of the Adjective Checklist investigated the extent to which it could be faked, the extent to which it actually is faked in employment settings, and the effect of faking on validity of the Checklist scores for assertiveness, sales effectiveness, cooperativeness, calmness, reasoning, conscientiousness, and imaginativeness. Administered to salesmen and sales applicants, scores were distorted in the direction of the sales stereotype, when the testees were told to fake. In employment situations, few applicants tend to fake. Directed faking seriously distorts validities of scores for predicting selling effectiveness; scales with greatest potential validity are those which are likely to be most distorted by sales applicants.—A. S. Thompson.

3146. Hokanson, J. E. (Florida State U.) The effects of guilt arousal and severity of discipline on adult aggressive behavior. *J. clin. Psychol.*, 1961, 17(1), 29-32.—In using Siegal Manifest Hostility scale, 3 TAT cards and the impressions rating of 2 specially designed protocols, 80 white male undergraduate students were selected from a pool of 375 males. $\frac{1}{2}$ of these Ss were classified as high test hostility Ss and the other $\frac{1}{2}$ as low test hostility Ss. Aggressive behavior towards the experiment was tested by using special findings, indicating among other things, that Ss admitting strong feelings of aggressiveness on psychological tests perceive their fathers as having been significantly less punitive than either their mothers or the parents of the low test hostility Ss.—V. J. Bieliauskas.

3147. Kamano, D. K. (State Research Hosp., Galesburg, Ill.) An investigation on the meaning of human figure drawing. *J. clin. Psychol.*, 1960, 16(4), 429-430.—45 institutionalized women diagnosed as schizophrenics, age 18-38, were instructed to "draw a woman." After the drawings were completed each S was asked to rate her own drawing on the semantic differential scale devised according to the criteria of Osgood, et al. 4 concepts were included to compare the meaning or associations assigned by each S: to My Ideal Self, My Actual Self, and My Least Liked Self. "The Ss tended to draw a figure that represented themselves much more than an ideal or an unfavorable one. This was interpreted as supporting the hypothesis that human figure drawings do represent the drawer's perception of self."—V. J. Bieliauskas.

3148. Kassarian, W. M. (U. California, Los Angeles) A study of Riesman's theory of social character. *Sociometry*, 1962, 25(3), 213-230.—"An empirical test of Riesman's theory of social character was carried out by constructing a five-point rating scale made up of 36 two choice items on inner-other-directedness, using undergraduate college students. Satisfactory reliability was obtained by the test-retest method, while validity was established both by predicting performance of predetermined groups of graduate students and by a comparison with actual social behavior. Application of a modified version of the scale to the general population yielded findings generally in accord with the theory. The study found Riesman's theory amenable to testing by means of an objective instrument, and the results constitute a support of his propositions." The complete inner-other-directedness scale is published.—H. P. Shelley.

3149. Kerr, M., Maki, B., & Ammons, R. B. Personality, values, and "intellectualism." *Proc. Mont. Acad. Sci.*, 1962, 21, 132-136.—"Comparisons were made of MMPI and Allport-Vernon scores of male and female college Ss placing relatively high, moderate, or relatively low value on intellectual activities. There were 39 Ss in each of the three male groups, and 17 Ss in each of the three female groups. A number of within-sex differences were found among the groups in mean MMPI and AV scores. The validity and utility of the MMPI in research studies for measuring fundamental dimensions of personality were questioned . . . [and] research problems . . . noted. Persons placing high value on intellectual activities differ markedly in personality characteristics from those placing low value on intellectual activities, but the exact nature of these differences must be explored."—C. H. Ammons.

3150. McGee, Richard Keith. (Vanderbilt U.) The relationship between response style and personality variables: Acquiescence and social orientation. *Dissert. Abstr.*, 1961, 22(4), 1257.—Abstract.

3151. Liggett, J. (King's Coll. Newcastle upon Tyne, 1, England) Eine neue Methode zur Untersuchung der Social Perception und der Selbsteinschätzung. [A new method for the assessment of social perception and self evaluation.] *Psychol. Beitr.*, 1962, 7(1), 101-120.—A short method, the Self-Evaluation Test (SVT), is described. This test is designed to collect information about the concepts which arise in an individual's perception of the social world around him and to assess his evaluation of the qualities that he perceives in himself and others. 7 human portraits were ranked by paired comparisons according to several different sorting qualities, and the correlation between any 2 rank orders was used as a measure of the phenomenal identity of the 2 ranking qualities. (English & French summaries)—H. J. Priester.

3152. McGreevey, J. C. (Clark County Mental Health Cent.) Interlevel disparity and predictive efficiency. *J. proj. Tech.*, 1962, 26(1), 80-87.—Questionnaire tests for non-ego-threatened traits more accurately predict selfconcept while predictions of peer concept are equally accomplished by questionnaire tests for ego-threatened tests. Clinical predictions from projective tests differed significantly from defensive Ss conscious descriptions. It appears that nondefensive Ss are consistent in their test behavior on direct and projective methods while defensive Ss

reveal something different of themselves on each type of device.—A. F. Greenwald.

3153. Phares, E. J. (Kansas State U.) **A note on authoritarianism and attitudes toward parents.** *J. clin. Psychol.*, 1960, 16(4), 389-390.—A modification of the California F scale was used to test the hypothesis that when the Ss scoring high and low on this scale were asked to list both positive and negative characteristics of their parents the low F Ss will list a higher proportion of negative qualities than will the high F Ss. 31 female and 33 male students in psychology classes were used as Ss for this study. Their responses were evaluated by 2 judges who were not cognizant of the F scale scores. The average agreement among the judges was 98% and the results provided support for the hypothesis at a statistically significant level.—V. J. Bieliauskas.

3154. Reel, Windle Delmar. (U. Nebraska Teachers Coll.) **A study of the relationship between personal information and social skills rating.** *Dissert. Abstr.*, 1961, 22(4), 1286.—Abstract.

3155. Renner, K. Edward; Maher, Brendan A., & Campbell, Donald T. (U. Pennsylvania) **The validity of a method for scoring sentence-completion responses for anxiety, dependency, and hostility.** *J. appl. Psychol.*, 1962, 46(4), 285-290.—A scoring-by-example manual was developed for use with the Rotter Incomplete Sentence Blank for scoring 3 variables. The aim was to provide an objective scoring technique for the variables and to examine validity and discriminant scorer reliability by means of a multitrait-multimethod matrix. Validity data were obtained from a college population, the criterion being peer reputation measures of the variables. Self-descriptions provided a minimum competitive standard against which to judge the value of sentence-completion scoring. Discriminant scorer reliability was demonstrated and internal consistency reliability examined. The validity coefficients were modest but promising and provide a background against which future multitrait-multimethod examinations of other tests and keys can be evaluated.—Journal abstract.

3156. Rimland, Bernard. (USN Personnel Research Activity, San Diego) **A scoring technique for reducing the effects of response bias in personality tests.** *Psychol. Rep.*, 1962, 10(2), 546.—The use of artificially skewed score distributions which magnify differences among low scorers is advocated as a method of reducing the advantage of falsifiers.—B. J. House.

3157. Rosenberg, Marshall B. (U. Wisconsin) **Situational structure and self evaluation.** *Dissert. Abstr.*, 1961, 22(6), 2072-2073.—Abstract.

3158. Santostefano, S. (U. Colorado, School Medicine) **An exploration of performance measures of personality.** *J. clin. Psychol.*, 1960, 16(4), 373-377.—An attempt was made in this study to devise tasks, "eliciting unitary, easily identified acts, judged to have psychological meaning in which satisfied criteria of space and time were involved." 5 factors were obtained which appear to be significant and which tend to describe the personality on a basis of certain overt actions. These findings suggested that it might be advisable to develop more extensive performance testing for personality evaluation.—V. J. Bieliauskas.

3159. Santostefano, Sebastian. (U. Colorado School Medicine) **Performance testing of personality.** *Merrill-Palmer Quart.*, 1962, 8(2), 83-97.—A survey of situational testing techniques from Galton to the present "suggests that much of the groundwork has already been laid for the development of promising techniques." (72 ref.)—E. L. Robinson.

3160. Schaie, K. Warner. (U. Nebraska) **On the equivalence of questionnaire and rating data.** *Psychol. Rep.*, 1962, 10(2), 521-522.—"The equivalence of Cattell's basic personality factors for the questionnaire and behavior rating domains was tested by conducting a multiple group factor analysis on the correlations among questionnaire and rating data on a group of 43 delinquent institutionalized girls. Equivocal results suggest that factor matching may depend on the specific characteristics of questionnaire responders and their raters."—B. J. House.

3161. Shanan, J. (Hadassah U. Hosp., Jerusalem) **Intraindividual response variability in figure drawing tasks.** *J. proj. Tech.*, 1962, 26(1), 105-111.—Greater consistency in DAP performance seems to be associated with clarity of external stimuli. Intraindividual variability is greatest when instructions are ambiguous (e.g., "draw a person"). Anxiety arousing situations apparently contribute to higher levels of variability.—A. F. Greenwald.

3162. Shultz, Meyer. (American U.) **Competence and stress: An analysis of individual differences in test performance.** *Dissert. Abstr.*, 1961, 22(4), 1243.—Abstract.

3163. Theiner, E. C. (Lackland AFB) **The magnitude of four experimental needs as expressed by two projective techniques.** *J. proj. Tech.*, 1962, 26(3), 354-365.—A group of 80 male students displayed a greater number of unacceptable needs (Successance and Agression) and a lesser amount of acceptable needs (Affiliation and Achievement) on the TAT than on the Incomplete Sentences Blank.—A. Greenwald.

3164. Tóth, Béla. **A beszédanalízis, mint a személyiségvizsgálat módszere.** [Speech analysis as a method of personality research.] *Pszichol. Tanulmányok*, 1958, 1, 71-75.—The phenomenon of audible speech is regarded as being closely connected with personality. A new method of speech analysis of the static and dynamic factors of speech is designed to shed light on these connections. At this point, however, speech analysis can only be used as an adjunct to other methods of personality assessments. References are made to the author's book entitled *Speech, Character and Personality*. (Russian & English summaries)—E. Friedman.

3165. Weinberg, G. H., Fluckiger, F. A., & Tripp, C. A. (Handwriting Inst., N. Y.) **The application of a new matching technique.** *J. proj. Tech.*, 1962, 26(2), 221-224.—A modification in the procedure for matching personality sketches with handwriting samples permitted judges initially to relate a number of sketches to each sample and then to narrow their final selection to a one-to-one relationship as would have been accomplished directly using the old procedure. Judges using both the old and new methods of matching performed significantly better with the new matching procedure.—A. F. Greenwald.

3166. Willingham, W. W., & Ambler, R. K. (USN School Aviation Medicine, Pensacola, Fla.) **Comparison of methods for deriving peer nomination scores.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-3003, Subtask 1, Rep. No. 35, ii, 5 p.—The purpose of this study was to determine by empirical means the optimal method for scaling peer nomination scores for groups of unequal size. Within-section peer nominations for the traits of Cautiousness, Original Thinking, Personal Relations, and Vigor were obtained for 208 naval aviation cadets divided into 11 sections of unequal size. These nominations were scaled by 6 methods. These distributions then were correlated with the Gordon Personal Inventory scales for the same traits. It was concluded that the type of score typically used is inferior. Relatively simple modifications will result in more precise measurement.—*USN SAM*.

Inventories

3167. Adams, G. S. (Los Angeles State Coll.) **Techniques de minimisation et d'exploitation des tendances de réponse dans les inventaires structurés d'auto-évaluation.** [Techniques for minimizing and exploiting response tendencies in structured self-evaluation inventories.] *Rev. Psychol. appl.*, 1961, 11(4), 303-341.—The problem posed by response tendencies is to exploit them when the effect is to improve validity and to eliminate their influence when it is undesirable. The methods for constructing and choosing tests to minimize distortion of responses are reviewed. Attention is then given to procedures for developing corrective scales to be used in discounting response tendencies. Another procedure is to develop inventories where the structure is disguised. (272 item bibliogr.)—*W. W. Wattenberg*.

3168. Amati, G., Ragozzino, D., & Procaccini, S. **Rilievi e considerazioni sulla validità dell'impiego del Minnesota Multiphasic Personality Inventory (M.M.P.I.) nella pratica psichiatrico-forense.** [Notes and considerations on the validity for the use of the Minnesota Multiphasic Personality Inventory in Psychiatric legal practice.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(3), 249-273.—There is a high frequency of agreement between psychiatrically conclusive judgment and psychodiagnostic profile obtained by applying the MMPI to 30 individuals guilty of various crimes.—*L. L'Abate*.

3169. Bendig, A. W. (U. Pittsburgh) **Factor analyses of the Guilford Zimmerman Temperament Survey and the Maudsley Personality Inventory.** *J. gen. Psychol.*, 1962, 67, 21-26.—The Guilford Zimmerman Temperament Survey and the Maudsley Personality Inventory were administered to 2 samples of male Ss (N 's = 54 and 58) and scores from the 12 scales included in the 2 inventories were separately intercorrelated for each sample. Centroid factor analyses of each correlation matrix yielded 4 significant factors which after oblique rotation were identified as the Extraversion-Introversion (EI), Emotionality (EM), Social Activity (SA), and friendliness (Fr) factors previously found in the GZTS. Although the MPI Neuroticism scale was heavily loaded on the Emotionality factor as expected, the MPI Extraversion scale was loaded on the Social Activity factor rather than on the Extraversion-Introversion factor. It was suggested that, because of the pool of items used by Eysenck in constructing

the MPI Extraversion scale, this scale does not measure the factor it was originally intended to measure.—*Author abstract*.

3170. Chyatte, C., & Goldman, I. J. (DePaul U.) **The willingness of actors to admit to socially undesirable behavior on the MMPI.** *J. clin. Psychol.*, 1961, 17(1), 44-47 actors were given the MMPI and their responses were evaluated in terms of the Subtle-Obvious scales of this test. The differences on the Subtle-Obvious scores failed to support the hypothesis that actors tend to show willingness to admit to unfavorable characteristics of their own; the K correction indicated that they tended to deny some aberrant tendencies.—*V. J. Bieliauskas*.

3171. Comrey, Andrew L., & Schlesinger, Beth. (U. California) **Verification and extension of a system of personality dimensions.** *J. appl. Psychol.*, 1962, 46(4), 257-262.—This study continues a program devoted to the development of a system of factored homogeneous item dimensions (FHIDs) in the area of personality questionnaires. 6 multiple choice items were used for each of 32 personality dimensions and 4 validation scales. These items were dispersed in a questionnaire and administered to 506 volunteer male and female Ss, preponderately college students. 3 factor analyses of items, each with 72 items from 12 of the 36 dimensions, revealed 14 FHIDs for which every item had a loading of .5 or more. Factor analysis of the 36 total FHID score variables plus 9 background data variables resulted in the major personality factors: shyness, dependence, dominance, hostility, and compulsiveness.—*Journal abstract*.

3172. Eckhardt, W. (Western State Hosp., Hopkingsville, Ky.) **Piotrowski's signs: Organic or functional?** *J. clin. Psychol.*, 1961, 17(1), 36-38.—750 Rorschach records of the North Carolina State Hospitals were evaluated in terms of Piotrowski's signs. "These results suggested that 5 or more signs were statistically reliable indicators of intellectual impairment, although this impairment might be congenital or functional as well as organic in origin." Other evaluation of the data suggested in North Carolina state hospitals, Piotrowski's signs are more likely to diagnose mental deficiency and schizophrenic reaction than brain disorder.—*V. J. Bieliauskas*.

3173. Gibson, H. B. **The Lie Scale of the Maudsley Personality Inventory.** *Acta psychol., Amsterdam*, 1962, 20(1), 18-23.—The majority of items intended to reveal lying do in fact do so. "Liar" respondents award themselves low N (neurosis) scores but differ little from the population in E (extraversion) scores. The former carries social stigma, the latter does not. Personal, social, or business advantage may also influence lie responses.—*G. Rubin-Rabson*.

3174. Gocka, E. F. (VA Hosp., American Lake, Wash.) **The introversion-extraversion factor and social desirability.** *J. clin. Psychol.*, 1960, 16(4), 380-383.—84 hospitalized male patients with former diagnosis of schizophrenia who were scheduled for a discharge at the time of this study were given the MMPI. Their responses were evaluated in terms of the Social Desirability scale, and the Introvert-Extravert scale. The findings were essentially the same as those reported by Edwards et al. However, when the introversion-extraversion dimensions were divided into sub scales made up totally of X type or O type items and a correlation with the MMPI scales at-

tempted, findings did not support the idea that X-O balance accounts entirely for a low correlation between a total scale and SD. The suggestion was made that possibly the introversion-extraversion factor is not as independent of the SD factor in the MMPI as some authors tend to assume.—V. J. Bieliauskas.

3175. Gocka, E. F., & Marks, J. B. (VA Hosp., American Lake, Wash.) **Second-order factors in the 16 PF test and MMPI inventory.** *J. clin. Psychol.*, 1961, 17(1), 32-35.—The study represents a replication of Cattell's 2nd-order personality factor studies with an attempt to co-ordinate the Sixteen Personality Factor Questionnaire (16 PF) factor scales with comparable MMPI factors. 84 hospitalized patients who had a former diagnosis of schizophrenia but who were at the point of being discharged were used as Ss. They were given the MMPI and the 16 PF—Form C tests. The degree of replication (of previous studies) was directly related to the amount of variance accounted for by each factor, such that the 1st factor had maximum correspondence with previous findings while the 4th factor had least.—V. J. Bieliauskas.

3176. Karson, S. (Dade County Child Guidance Clinic, Miami, Fla.) **Second-order personality factors in positive mental health.** *J. clin. Psychol.*, 1961, 17(1), 14-19.—In order to clarify the meaning of the primary factors in the Cattell Sixteen Personality Factor Questionnaire and to identify the 2nd-order personality factors, a replication of the Cattell study was attempted on United States Air Force airmen undergoing recruiting training. Forms A and B of the 16 P-F study were administered to a sample of 96 recruits. The test scores were then evaluated following the technique suggested by Cattell. The factors of extraversion vs. introversion, anxiety vs. dynamic integration, and obsessive-compulsivity vs. sociopathic deviance appeared to be a clear replication of a previously identified 2nd-order factor. It was suggested that other factors may need additional studies for further application.—V. J. Bieliauskas.

3177. Langer, Philip. (Utah State U.) **Sex differences in response set.** *J. Psychol.*, 1962, 54(1), 203-207.—The Gough Adjective Checklist was administered to 110 Ss at Trenton State College, who were told to give a "real self-image." Scores were analyzed to yield the agree-disagree and desirability-undesirability dimensions of response set. 4 groups were formed; male agree-set ($N=17$), male disagree-set ($N=18$), female agree-set ($N=47$), and female disagree-set ($N=48$). 2 weeks later the Ss gave an "ideal self-image" on the Gough. Both male subgroups showed significant trends toward increased agreeing sets. Both female groups showed significant variability within each subgroup, but the direction of change was about equally divided.—*Author abstract.*

3178. Lewin, Mark Henry. (U. Wisconsin) **Change in social desirability responses as a function of direct instructions, verbal reinforcement, role playing, and counter-conditioning.** *Dissert. Abstr.*, 1961, 22(3), 916.—*Abstract.*

3179. Pichot, P., Perse, J., & Zimbardo, N. **Étude sur la fidélité de l'Inventaire Multiphasique de Personnalité du Minnesota (M.M.P.I.) par la méthode du partage par moitié.** [Study of the reliability of the MMPI by the split-half method.] *Rev. Psychol. appl.*, 1961, 11(4), 297-301.—Previous studies of the MMPI have used the test-retest method. In

this study, 2 subscales for each of the original scales were obtained by choosing an equal number of items from each and placing them in a subtest. (Because of the small number of items this could not be done for the L Scale.) The subtests were both administered to 50 men and 50 women unselected psychiatric patients. Coefficients of correlation were computed and corrected for attenuation by the Spearman-Brown formula. The weakest correlations were .63 on the K scale for the men and .49 on the MA scale for the women. Most correlations were in the .70's. It is concluded that the scales have a satisfactory homogeneity.—W. W. Wattenberg.

3180. Saltz, Eli; Reece, Michael, & Ager, Joel. (Wayne State U.) **Studies of forced-choice methodology: Individual differences in social desirability.** *Educ. psychol. Measmt.*, 1962, 22(2), 365-370.—The forced-choice technique is useful in eliminating group standards of social desirability for a test, but it does not solve the problem of evaluating the consequences of individual social desirability. However, individual social desirability was found to be a source of reliable variance in a study using the Edwards Personal Preference Schedule. A factor analytic study now in progress is intended to assess the relative contribution of individual social desirability to total test variance.—W. Coleman.

3181. Stricker, G. (U. Rochester) **A comparison of two MMPI prejudice scales.** *J. clin. Psychol.*, 1961, 17(1), 43.—"The group form of the MMPI was administered to 390 male college freshmen. Their scores on the Gough and Altus and Tafejian scales of prejudice were compared, and a correlation of .59 was discovered. Alternative methods of using these scales were recommended."—V. J. Bieliauskas.

3182. Walker, Jerald Neil. (U. Washington) **An examination of the role of the experimentally determined response set in evaluating Edwards' Social Desirability scale.** *Dissert. Abstr.*, 1961, 22(5), 1712-1713.—*Abstract.*

3183. Wiggins, Jerry S. (Stanford U.) **Strategic, method, and stylistic variance in the MMPI.** *Psychol. Bull.*, 1962, 59(3), 224-242.—"Strategic variance arises in the assessment of an S's communality with respect to a normative group on a dimension defined by contrast with a criterion group. Method variance is due to the idiosyncratic nature of the total item pool in regard to the proportion of true and false keyings and the distribution of item popularity values. (Stylistic variance includes dispositions to agree (acquiescence) or disagree (cautiousness) with neutral statements, independently of item content." In these terms, relevant research with the MMPI is reviewed.—W. J. Meyer.

3184. Willingham, W. W., & Ambler, R. K. (USN School Aviation Medicine, Pensacola, Fla.) **The relation of the Gordon Personal Inventory to several external criteria.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-3003, Subtask 1, Rep. No. 34. ii, 5 p.—This investigation studied the relationship between 4 personality traits as measured by the Gordon Personal Inventory (GPI) and several external criteria consisting of peer nominations of the same traits. Peer nominations and GPI scores for 208 naval aviation cadets divided into 11 sections of unequal size were analyzed. 3 of the GPI scales showed moderate correlations with external criteria.

A 4th was not significantly correlated with a criterion which it supposedly should predict well. Implications of the findings are discussed.—*USN SAM*.

Projective Methods

3185. **Berger, L., & Everstine, L.** (Franklin D. Roosevelt VA Hosp., Montrose) **Test-retest reliability of the Blacky Pictures test.** *J. proj. Tech.*, 1962, 26(2), 225-226.—Analysis of Blacky test records of 50 male college students revealed significant test-retest correlations on all 13 test dimensional scores and all 4 patterns of conflict.—*A. F. Greenwald*.
3186. **Block, W. E.** (Yeshiva U.) **Psychometric aspects of the Rorschach technique.** *J. proj. Tech.*, 1962, 26(2), 162-172.—"Viewing the Rorschach psychometrically, we find a plethora of mixed, sometimes contradictory psychometric methods operating, crude application of measurement principles, quasi-objective scoring, low reliability because of unknown triadic interactions among testee-tester, and groping, sometimes naive, sometimes sophisticated, for a valid rationale." The author suggests acceptance of Rorschach as a purely empirical technique with a shift in emphasis to how the S adjusts to the contemporary test situation. Revision of the present scoring procedures is also suggested.—*A. F. Greenwald*.
3187. **Bloom, B. L.** (Hawaii State Hosp.) **The Rorschach popular response among Hawaiian schizophrenics.** *J. proj. Tech.*, 1962, 26(2), 173-181.—Hospitalized Hawaiian schizophrenics produced 9 popular responses previously found among a normal reference group. Degree of popularity was presented as a relevant factor, and no ecological influence on development of P was found. "There may be a non-linear relationship between degree of psychopathology and frequency of perception of P."—*A. F. Greenwald*.
3188. **Blum, G. S.** (U. Michigan) **A guide for research use of the Blacky Pictures.** *J. proj. Tech.*, 1962, 26(1), 3-29.—A factor analysis of Blacky responses elicited from 210 male undergraduates produced 30 factors which are given dynamic interpretations. Significant relationships between factors along with their relationship to criterion variables are presented. This approach to evaluating Blacky responses clarifies already existing scoring procedures and provides a guide for the systematic interpretation of test records.—*A. F. Greenwald*.
3189. **Dana, R. H.** (West Virginia U.) **The validation of projective tests.** *J. proj. Tech.*, 1962, 26(2), 182-186.—Construct validity should be established as a base from which further empirical and content validation studies of projective techniques may be launched. The importance of clarifying clinical concepts prior to attempting predictions of outcome variables is stressed.—*A. F. Greenwald*.
3190. **Davis, Harold Bernard.** (Michigan State U.) **Some symbolic meanings of the Rorschach inkblots.** *Dissert. Abstr.*, 1962, 22(12), 4405-4406.—*Abstract*.
3191. **Exner, J. E., Jr.** (Depauw U.) **The effect of color on productivity in Cards VIII, IX, X of the Rorschach.** *J. proj. Tech.*, 1962, 26(1), 30-33.—Results with 40 college students tend to indicate that color does affect Rorschach productivity on Cards VIII, IX, and X. Achromatic cards do not appear to affect the development of popular responses "animal" and "spider" or "crab" on VIII and X respectively.—*A. F. Greenwald*.
3192. **Filmer-Bennett, G., & Klopfer, W. G.** (Winnebago State Hosp.) **Levels of awareness in projective tests.** *J. proj. Tech.*, 1962, 26(1), 34-35.—Psychologists using TAT and Sentence Completion responses attempted to predict selfratings of 20 junior college women who rated themselves along continua for communication, intellect, conventionality, and sensitivity. Only TAT data bearing on communicability contributed to significant predictions. The notion that Sentence Completion elicits material closer to consciousness than does the TAT is not substantiated by the findings.—*A. F. Greenwald*.
3193. **Fisher, S.** **Relationship of Rorschach human percepts to projective descriptions with self reference.** *J. proj. Tech.*, 1962, 26(2), 231-233.—Ss with high H scores on Rorschach tended to project significantly more positive self-descriptions while fearing a series of masks than did Ss with low H scores.—*A. F. Greenwald*.
3194. **Gill, Harwant Singh.** (Boston U.) **Delay of response in problem solving and color response to Rorschach stimuli.** *Dissert. Abstr.*, 1961, 22(4), 252.—*Abstract*.
3195. **Glymour, C., Ammons, C. H., & Ammons, R. B.** **Projective test protocols of students placing extreme (high or low) value on intellectual activity.** *Proc. Mont. Acad. Sci.*, 1962, 21, 105-112.—Comparisons of TAT and Rorschach responses were made for male and female students placing extremely high or extremely low value on intellectual activity, as measured by the Cultural Information Survey (CIS). Analyses were based on protocols obtained by individual and by group administration of the TAT and by group administration of the Rorschach. Analysis of the 2 sets of TAT protocols revealed no important differences between the extreme CIS scorers, with the possible exception that high CIS females in both cases used explicitly stated reasoning to develop their story lines. There was no cross validation of differences between the 2 pairs of male Ss. Rorschach responses of females suggested that high CIS scorers were somewhat more anxious, impulsive, abstraction-oriented, and potentially creative. Some possible reasons for the meagre results with the TAT were discussed, and further studies suggested.—*C. H. Ammons*.
3196. **Goldfried, M. R.** (U. Rochester) **Some normative data on Rorschach developmental level "card pull" in a psychiatric population.** *J. proj. Tech.*, 1962, 26(3), 283-287.—The level of perceptual organization usually elicited by each card among a group of 110 male psychiatric patients is presented. The blot with the highest developmental level was Card III, the lowest D L was Card IX. A correlation between Rorschach D L and IQ was demonstrated in this psychiatric population and suggests further investigation among other populations.—*A. Greenwald*.
3197. **Levine, M., & Spivack, G.** (Devereux Found. Inst.) **Human movement responses and verbal expression in the Rorschach test.** *J. proj. Tech.*, 1962, 26(3), 299-304.—A positive relationship was found to exist between an index of repression score and movement responses. It is suggested that the Rorschach elicits a characteristic style of verbal

expression which reflects the level of personality differentiation.—*A. Greenwald.*

3198. Levitt, E. E., Lubin, B., & Zuckerman, M. (Indiana U. Medical Cent.) A simplified method of scoring Rorschach content for dependency. *J. proj. Tech.*, 1962, 26(2), 234-236.—Evidence is offered as to the reliability of scoring Rorschach content for dependency. Construct validity is suggested by findings that volunteers for an hypnosis experiment score significantly higher on dependency than do nonvolunteers.—*A. F. Greenwald.*

3199. Lindzey, Gardner. Projective techniques and cross-cultural research. New York: Appleton-Century-Crofts, 1961. ix, 339 p. \$6.00.—Written primarily for applications in anthropological research. Definitions, theoretical foundations, varieties, and the interpretive process of projective techniques are explored.—*C. W. Page.*

3200. Marks, P. (U. Kansas Medical Cent.) Effects of texture and form on the popular response to Card VI of the Rorschach. *J. clin. Psychol.*, 1961, 17(1), 38-41.—An attempt was made to study the determinants of the popular response to the standard blot, Card VI, on the Rorschach test. 71 Ss were given the standard and experimental Card VI of the Rorschach test in counterbalanced order. No significant differences were found between the total number of responses on both cards. "A significantly greater number of Ss responded to texture rather than form, but form was a sufficient stimulus for the popular response.—*V. J. Bieliauskas.*

3201. Moos, R. H. (U. California School Medicine) Effects of training on students' test interpretations. *J. proj. Tech.*, 1962, 26(3), 310-317.—A seminar combining instruction in MMPI with introduction to Q-sorting resulted in closer agreement between student and expert interpretations. A semester's exposure to Rorschach without Q-sort instruction produced no significant improvement in students' interpretations. "The findings clearly emphasize the large amount of error variance in test interpretations, and support the often cited superiority of the inter-sorter agreement which can be achieved in the interpretations of empirical objective tests, such as the MMPI, in which the rules of interpretation are made explicit and are relatively easily communicated.—*A. Greenwald.*

3202. Murstein, B. I., & Collier, H. L. (Interfaith Counseling Cent.) The role of the TAT in the measurement of achievement as a function of expectancy. *J. proj. Tech.*, 1962, 26(1), 96-101.—Results fail to confirm the hypothesis that the group with maximum uncertainty would be more highly motivated and thus produce more achievement fantasy. The role of TAT fantasy in relation to the achievement motive remains unclear.—*A. F. Greenwald.*

3203. Neuringer, C. (U. North Dakota) Manifestations of anxiety on the Rorschach test. *J. proj. Tech.*, 1962, 26(3), 318-326.—Equivocal results reported in studies on Rorschach anxiety are discussed and reviewed. The value of the Rorschach Content Test in assessing anxiety is upheld. Rorschach determinants are found to differ in their relationship to laboratory-induced and real-life anxiety.—*A. Greenwald.*

3204. Palmer, J. O., & Lustgarten, B. J. (U. California Medical Cent., Los Angeles) The predic-

tion of TAT structure as a test of Rorschach's experience-balance. *J. proj. Tech.*, 1962, 26(2), 212-220.—Rorschach intratensives tend to emphasize internal feelings of their heroes on TAT stories, but extratensives do not stress external personality characteristics nor environmental pressures in their stories. TAT stories of the coarctate group bore the highest ratings for "violence." As expected, ambiequals tend to mention both internal and external characteristics of their TAT heroes.—*A. F. Greenwald.*

3205. Pine, Fred. (New York U.) Creativity and primary process: Sample variations. *J. nerv. ment. Dis.*, 1962, 134(6), 506-511.—A group of actors was compared with undergraduates on the manifestation of primary process thinking in the Rorschach test. Hypotheses regarding creativity and primary process were tested for the actors. "The results, in contrast to the earlier ones, showed no clear relationships between the primary process variables and quality of created productions. Sample differences in the handling of primary process, and their implications for relations between primary process and creative quality, were explored.—*N. H. Pronko.*

3206. Sacks, H. (U. California, Los Angeles) The effect of preliminary verbal conditioning on inkblot test responses. *J. proj. Tech.*, 1962, 26(3), 332-336.—2 sets of Wickes' inkblots were administered to a group. Verbal reinforcement of human movement responses failed to influence the subsequent development of M, thus indicating the relative stability of this type of response.—*A. Greenwald.*

3207. Victor, F. (4 East 81st St., NYC) Ist die Graphologie eine Ausdrucks oder eine Projektive Methode? [Is graphology an expressive or projective method?] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 351-357.—Discussions for and against graphology as a projective method are presented, in the end suggesting that scientifically founded graphology could be considered a projective method. If the dynamic expression of handwriting analysis is considered and the individual is as familiar with psychology as one who is using Rorschach, TAT, or other projective methods, the application of the handwriting analysis as a projective technique is possible. Actually the expressive methods and projective methods are not in contradiction but have much in common. Some graphologists would themselves, particularly in the United States, put a special emphasis on expressive rather than projective side of this method of personality interpretation.—*V. J. Bieliauskas.*

3208. Weisskopf-Joelson, E., & Foster, H. C. (Purdue U.) An experimental study of the effect of stimulus variation upon projection. *J. proj. Tech.*, 1962, 26(3), 366-370.—CAT pictures were modified to include both a chromatic and human figure series. The authors report no significant differences in productivity when animal-human or chromatic-achromatic stimuli are presented.—*A. Greenwald.*

PERSONALITY DIAGNOSIS

3209. Alvarez, R. R. (Western Reserve U.) Comparison of depressive and brain-injured subjects on the trail making test. *Percept. mot. Skills*, 1962, 14(1), 91-96.—The Trail Making Test was administered to 32 reactive-depressives and 32 brain damaged patients matched in pairs for age, sex, and education. The performance-times of the reactive-

depressive group were significantly better than those of the brain damaged. The incidence of misclassified depressive patients is comparable to that reported by Reitan for unselected patients without brain damage. The results are interpreted as indicating that deficits in performance-time scores on the Trail Making Tests are more likely to be a function of the effects of cerebral lesions on perceptual and motor integrations than of lowered motivation due to depressive mood in the absence of organic involvement.—*W. H. Guertin.*

3210. Anker, James M. (VA Hosp., Perry Point, Md.) **Chronicity of neuropsychiatric hospitalization: A predictive scale.** *J. consult. Psychol.*, 1961, 25(5), 425-432.—Construction of a new MMPI scale for neuropsychiatric hospital chronicity by item analysis and cross validation. The scale discriminates well up to 18 months, with a minimum of false positives.—*E. R. Oetting.*

3211. Beck, Aaron T. (U. Pennsylvania) **Reliability of psychiatric diagnoses: I. A critique of systematic studies.** *Amer. J. Psychiat.*, 1962, 119(3), 210-216.—"Pertinent systematic studies of the reliability of psychiatric diagnosis were critically examined. It was pointed out that each of these studies presented certain methodological problems which made their findings inconclusive. An experimental design was presented to meet these problems and thus yield a more informative index of reliability. By systematically varying the important variables, such as the level of experience of the psychiatrists, the time interval between interviews, the use of ancillary information, and the degree of refinement of the nosological categories, it will be possible to determine their effects on reliability."—*N. H. Pronko.*

3212. Chatham, Lois Rommel. (U. Houston) **A quantitative system for assessing the intensity of psychiatric complaints.** *Dissert. Abstr.*, 1961, 22(3), 911.—*Abstract.*

3213. Fisher, Barbara E. (Provincial Hosp., Lancaster, New Brunswick, Canada) **Block-design rotation by brain-damaged, schizophrenic and normal subjects.** *Bull. Maritime Psychol. Ass.*, 1962, 11(1), 20-27.—Groups were compared on a modified form of Shapiros Block-Design Rotation Test. Evidence for lawful relationships between amount of rotation and organization of stimulus properties was found. Patient groups did not differ; they did differ from normals. Negative relationship between intelligence and amount of rotation noted in normals only.—*C. W. Page.*

3214. Fisher, G. M. (Fairview State Hosp., Costa Mesa, Calif.) **Discrepancy in Verbal and Performance IQ in adolescent sociopaths.** *J. clin. Psychol.*, 1961, 17(1), 60.—Wechsler's hypothesis that sociopaths usually have higher Performance than Verbal IQs was examined on 177 white, 55 Mexican-American, and 42 Negro adolescent sociopaths. The mean Performance IQ was significantly greater than the mean Verbal IQ in the white and Mexican-American groups, but not in the Negro group.—*V. J. Bieliauskas.*

3215. Foulds, G. A. (Runwell Hosp., Wickford, Essex, England) **A quantification of diagnostic differentiate.** *J. ment. Sci.*, 1962, 108(Whole No. 455), 389-405.—The diagnostic function of the interview should be distinguished from the etiological—perhaps such difference functions cannot be served by a single psychiatric interview. Symptoms can be

frequent in different nosologies without being differentiating. A symptom or groups of symptoms are differentiae if they distinguish, at least at the 5% level, between the class in question and any other class. Specific differentiae are symptoms which distinguish, at least at the 5% level, between the class in question and 70% or more of all classes with which it is being compared. Anxiety should be compared with all other symptom clusters singly as well as collectively. For 80 psychotic and 140 neurotic women agreement with clinical diagnosis obtained with the Runwell Symptom-Subjective-Sign Inventory was 67%. A clear distinction between symptoms and signs on one hand and personality traits on the other will aid progress in constructing instruments which can help diagnoses.—*W. L. Wilkins.*

3216. Frost, B. P. (Child Training Guidance Cent., London, England) **An application of the method of extreme deviations to the Wechsler Intelligence Scale for Children.** *J. clin. Psychol.*, 1960, 16(4), 420.—107 WISC records from a child guidance clinic population were evaluated by the method of extreme deviation in order to determine the diagnostic-psychiatric meaning of high-low profiles. Results failed to support any psychiatric category. However, some statistically significant findings were observed in profile trends of certain diagnostic groups.—*V. J. Bieliauskas.*

3217. Geiser, Robert Lee. (Boston U.) **The psychodiagnostic efficiency of WAIS and Rorschach scores: A discriminant function study.** *Dissert. Abstr.*, 1961, 22(3), 915.—*Abstract.*

3218. Gilbertstadt, Harold, & Farkas, Edwin. (VA Hosp., Minneapolis, Minn.) **Another look at MMPI profile types in multiple sclerosis.** *J. consult. Psychol.*, 1961, 25(5), 440-444.—The MMPI indicates severe depression more frequently in MS patients, particularly those with lower IQs (Wechsler-Bellevue) than in controls. Younger, more intelligent patients tend to obtain nondepressed profiles. "... the importance of a longitudinal approach to MS was indicated."—*E. R. Oetting.*

3219. Goldfried, M. R. (U. Rochester) **Rorschach developmental level and the MMPI as measures of severity of psychological disturbance.** *J. proj. Tech.*, 1962, 26(2), 187-192.—No significant relationship was found between Rorschach and MMPI estimates of severity of pathology. A scoring system for Rorschach based on Werner's developmental theory and Meehl-Dahlstrom's rules for classifying MMPI profiles were used. The possibility that different levels of personality functioning are being tapped by these tests is discussed.—*A. F. Greenwald.*

3220. Hunt, W. A., Walker, R. E., & Jones, N. F. (Northwestern U.) **The validity of clinical ratings for estimating severity of schizophrenia.** *J. clin. Psychol.*, 1960, 16(4), 391-393.—"Twelve schizophrenic patients, rank ordered on the basis of severity of their disorder by three experienced clinicians, were given the Vocabulary and Comprehension subtests of the Wechsler intelligence scale. The test responses were then rated independently by other clinicians using a seven-point scale in rating for amount of schizophrenic pathology present, potential intelligence exhibited, communicability, and concreteness of thinking." Statistically significant-high agreement was found in the rating between judges and in terms of

the categories on which the rating took place. These findings that subjective ratings by clinicians particularly in regard to the evaluation of patients' intelligence have some merit.—*V. J. Bieliauskas.*

3221. Karson, S. (Dade County Child Guidance Clinic, Miami, Fla.) **Validating clinical judgments with the 16 P. F. test.** *J. clin. Psychol.*, 1960, 16(4), 394-397.—Psychiatric social work staff members of a child guidance clinic were given the task of rating personality traits of mothers of emotionally disturbed children. The profile sheet of the 16 Personality Factor Questionnaire was used as a rating scale. "The results showed a significant amount of agreement among the entire staff with regard to their stereotypes of the clinic mothers' personality traits." The results indicated that the most valid ratings were made on 8 factors on which the staff as a whole showed the most agreement, and the least valid ratings were made on 8 other factors on which the staff showed the least agreement.—*V. J. Bieliauskas.*

3222. Klopfer, W. G. (U. Portland) **The role of diagnostic evaluation in clinical psychology.** *J. proj. Tech.*, 1962, 26(3), 295-298.—The author critically evaluates 6 major agreements for diminishing the diagnostic role of the clinical psychologist. He concludes that diagnostic functions present the greatest challenge and require the most scientific resourcefulness.—*A. Greenwald.*

3223. Korner, A. F. (Mt. Zion Hosp., San Francisco) **Developmental-diagnostic dimensions as seen through psychological tests.** *J. proj. Tech.*, 1962, 26(2), 201-211.—Psychological test results are discussed as they contribute to the detection of developmental arrest in childhood. Evenness of development, flexibility, and capacity for further development may be assessed. A case is presented to illustrate the diagnostic clues available from cognitive test data.—*A. F. Greenwald.*

3224. Leventhal, T., Slepian, H. J., Gluck, M. R., & Rosenblatt, B. P. (Worcester Youth Guidance Cent.) **The utilization of the psychologist-patient relationship in diagnostic testing.** *J. proj. Tech.*, 1962, 26(1), 66-70.—A case is made for patient-oriented test sessions which contribute increased data as to the patient's perception of problem areas and provide therapeutic as well as diagnostic benefits. Case illustrations are provided to demonstrate the use of test behavior and productions in establishing a relationship with the patient.—*A. F. Greenwald.*

3225. Lipsher, David Harold. (Stanford U.) **Consistency of clinicians' judgments based on MMPI, Rorschach and TAT protocols.** *Dissert. Abstr.*, 1962, 22(12), 4409-4410.—*Abstract.*

3226. Mahesh, M. D. (Belmont Hosp., Sutton, England) **Intelligence and verbal knowledge in relation to Epstein's Overinclusion Test.** *J. clin. Psychol.*, 1960, 16(4), 417-419.—Epstein's Overinclusion Test, Raven's Progressive Matrices, and the Mill Hill Vocabulary (Synonyms) Test were given to 217 male psychiatric cases at Belmont Hospital. Special attention was given to 120 cases with psychiatric diagnosis primarily of neurosis or personality disorders. The relationship between intelligence and overinclusion appeared to be negative and significant. "The study points out the need for caution in the use of Epstein's Test for differential diagnosis."—*V. J. Bieliauskas.*

3227. Norman, R. P., & Wilensky, H. (Franklin Delano Roosevelt Hosp., Montrose, N. Y.) **Item difficulty of the WAIS Information subtest for a chronic schizophrenic sample.** *J. clin. Psychol.*, 1961, 17(1), 56-57.—"The Information scores of 100 schizophrenics who had taken the WAIS were compared on an item basis with the scores obtained by 1700 normal subjects in Wechsler's standardization group. Eight of the 29 items differentiated the two groups significantly at the .01 level. These differences suggested that schizophrenic deficit may be greater in items that call for reasoning as contrasted with those requiring pure recall."—*V. J. Bieliauskas.*

3228. Payne, R. W., & Friedlander, D. (Queen's U., Kingston, Ontario) **A short battery of simple tests for measuring overinclusive thinking.** *J. ment. Sci.*, 1962, 108(Whole No. 454), 362-367.—A combined score from correct sortings in an object classification test, total number of words used in explaining the Benjamin proverbs, and the average number of objects per group selected during the handing-over-part of the Goldstein Object Sorting Test, differentiates acute schizophrenics from normals, neurotics, and endogenous depressives.—*W. L. Wilkins.*

3229. Petersen, Robert Carl. (U. Minnesota) **The effect of item content and distribution instructions upon reliability in the rating of psychiatric patients.** *Dissert. Abstr.*, 1961, 22(6), 2071-2072.—*Abstract.*

3230. Porteus, S. D. (U. Hawaii) **Maze test reports.** *Percept. mot. Skills*, 1962, 14(1), 58.—The author reviews several reported research investigations employing the Porteus Maze Test. Perseveration upon retesting was greater for cases on chlorpromazine. Cultural variables and Conformity-Flexibility scores are reviewed. 2 studies show the sensitivity of the mazes to detecting psychosurgery and aging effects.—*W. H. Guertin.*

3231. Prado, W. M., Peyman, D. A., & Lacey, O. L. (U. Alabama) **A validation study of measures of flattened affect on the Bender-Gestalt Test.** *J. clin. Psychol.*, 1960, 16(4), 435-438.—Some authors suggest that "flattened affect" is indicated on Bender Gestalt drawings by flattened curves and/or a decrease in angulation. 120 Ss were included in this investigation which aimed to determine the objective value of these specific signs in Bender Gestalt drawings; 40 were flattened affect psychotics, 40 were non-flattened affect psychotics, and 40 were firemen. The mean angulation and curvature scores were obtained for the 3 groups. "The Bender Gestalt test does not appear to distinguish adequately between 'flattened affect' and 'non-flattened affect' groups."—*V. J. Bieliauskas.*

3232. Quast, Wentworth. (U. Minnesota Medical Cent.) **The Bender-Gestalt: A clinical study of children's records.** *J. consult. Psychol.*, 1961, 25(5), 405-408.—100 patients aged 10-12 were divided into suspected brain damaged and suspected emotionally disturbed groups. Of 17 preselected attributes, 12 discriminated significantly. Inter-correlation of attributes is low.—*E. R. Oetting.*

3233. Sarbin, Theodore R. **A new model of the behavior disorders.** *Gauein*, 1962, 10(6), 324-341.—Contrary to the traditional model based primarily on work of medical practitioners, this model was introduced and developed by social psychologists. It

consists of 3 components: alarm, adaptive phase, and exhaustion or depletion. The 2nd component is subdivided into noneffective and tranquilizing techniques, change in beliefs or values, redeployment or redirection of attention, and instrumental acts. Actually an extension of the "stress-model," it originates from the theory that the behavior S manifests in an effort to reduce tensions becomes fixed by the behavior of other persons. It is contended that people who have been in mental hospitals for many years are the products of the antecedent conditions which led to their hospitalization and of the social organization of this hospital.—*J. A. Lucker.*

3234. Sarbin, Theodore R. The present status of the clinical-statistical prediction problem. *Garwein*, 1962, 10(6), 315-323.—A series of tests showed the truth-value of statistical prediction to be superior to the clinical method, essentially because the clinician is free to apply untested biases of doubtful or unknown validity, whereas the statistician can use only major premises of known credibility. Utilizing intuition, idiographic-nomothetic distinction, and syllogism are suggested to improve the clinician's validity of prediction.—*J. A. Lucker.*

3235. Sastry, N. N. S., & Rao, S. K. Ramachandra. A study of projected aggression through TAT responses. *Trans. All-India Inst. Ment. Hlth.*, 1960, 1, 17-28.—A group of 30 inpatients were administered 5 Indian TAT cards (No. 2, 3, 7, 15, 19). The scale devised by Scodel and Lipetz (a 5-point scale) was used for scoring. Chi square tests revealed that schizophrenics with histories of suicidal or assaultive behavior produced TAT stories in which the central characters were overtly more hostile.—*U. Pareek.*

3236. Semeonoff, B. Self-description as an instrument in personality assessment. *Brit. J. med. Psychol.*, 1962, 35(2), 165-175.—"That self-description may be analysed in terms of identifiable response patterns or variables seems to have been satisfactorily established. While the power of these to discriminate between accepted and rejected candidates for counseling is not very pronounced, it seems possible to think of them as 'favorable' and 'unfavorable' in relation to personality adjustment. Indications from self-descriptions are in general agreement with information derived from projective techniques. The two approaches are complementary to one another, and are further alike in that both are exploratory instruments rather than bases for statistical prediction."—*C. L. Winder.*

3237. Siegal, Richard S., & Ehrenreich, Gerald A. Inferring repression from psychological tests. *Bull. Menninger Clin.*, 1962, 26(2), 82-91.—The psychologist needs to increase his sensitivity to the presence of repression and to the differences in the way it fits into ego organization and reveals itself in psychological tests. The presence of repression may be identified through sensing that something is missing in the response and that defensive ego activity is following and supporting the act of repression. Every test response can be understood potentially as having both defensive and impulse meanings. Examples are given from the Rorschach and Word Association Tests.—*W. A. Varvel.*

3238. Sperber, Zanwil, & Spanner, Marvin. (Mount Sinai Hosp., Los Angeles) Social desir-

ability, psychopathology, and item endorsement. *J. gen. Psychol.*, 1962, 67, 105-112.—The prediction was made that the self-descriptive responses to a personality inventory by Ss suffering from some degree of psychopathology would be significantly less related to the SD values of the items than was the case for a group of normal Ss. The prediction was verified. Ss' responses to the items in high and low SD quartiles also supported the conclusion that the use of self-descriptive personality assessment procedures is not necessarily invalidated because of the operation of the social desirability variable.—*Author abstract.*

3239. Stern, Daniel Jacob. (U. Wisconsin) A ratio scale of abnormal behavior. *Dissert. Abstr.*, 1961, 22(6), 2084.—*Abstract.*

3240. Strumpfer, D. J. W., & Nichols, R. C. (Purdue U.) A study of some communicable measures for the evaluation of human figure drawings. *J. proj. Tech.*, 1962, 26(3), 342-353.—16 DAP measures failed to differentiate between normal, neurotic, and schizophrenic samples. Failure to demonstrate a relationship between DAP and CPI measures tends to cast further doubt on the DAP's value in assessing personality characteristics.—*A. Greenwald.*

3241. Suinn, R. M. (Whitman Coll.) The Shipley-Hartford Retreat Scale as a screening test of intelligence. *J. clin. Psychol.*, 1960, 16(4), 419.—The IQs obtained using the WAIS and the Shipley-Hartford Scale for 29 Ss from a VA Hospital in Palo Alto, California were compared via Pearson's Product Moment correlation. Highly significant correlations were found. "It was concluded that the Shipley-Hartford Scale could be useful as a screening measure of intelligence with neuropsychiatric patients."—*V. J. Bieleauskas.*

3242. Vinoda, K. S. The investigation of thought disorders by psychometric tests. *Trans. All-India Inst. Ment. Hlth.*, 1960, 1, 32-38.—Thought disorders can be classified into: (a) disorders of the formal aspect pertaining to the production of thought and (b) disorders of content. Broad results are given for some tests found useful in revealing thought disorders.—*U. Pareek.*

3243. Walton, D., & Mather, M. D. (Winwick Hosp., Warrington, England) Differential response to questionnaire items of neuroticism by "defensive" and "non-defensive" subjects. *J. ment. Sci.*, 1962, 108(Whole No. 455), 501-504.—For 80 hospitalized anxiety states, reactive depressions, and obsessionals, a normal or lower than normal score on the N scale of the Maudsley Personality Inventory can be shown to be "defensive." A discrepancy score between the shortened forms of the MPI and the Maudsley Medical Questionnaire can successfully discriminate "suspect" neurotics and normals.—*W. L. Wilkins.*

3244. Zigler, Edward, & Phillips, Leslie. (Yale U.) Case history data and psychiatric diagnosis. *J. consult. Psychol.*, 1961, 25(5), 458.—Diagnostic groups are compared with the population on age, intelligence, education, occupation, employment history, and marital status. Hospitalized individuals are not representative of the population and diagnostic groups also differ.—*E. R. Oetting.*

PERSONALITY ADJUSTMENT

3245. Block, Jack. (U. California, Berkeley) **Ego identity, role variability, and adjustment.** *J. consult. Psychol.*, 1961, 25(5), 392-397.—Role variability is assessed by ranking adjectives characterizing the S's own behavior in relation to 8 different individuals. Role variability related significantly to a measure of "susceptibility to anxiety" from a CPI scale. Role rigidity did not. An autonomic perception questionnaire (APQ) measures "autonomic feedback" by self-description of somatic symptoms characteristic of anxiety. APQ relates positively to the manifest anxiety scale and negatively to Barons' ego strength scale. High scores were also related to anxiety and depression from the Nowlis adjective check list. Autonomic feed-back is related in both anxiety and happiness states. Sex differences are discussed.—E. R. Oetting.

3246. Buhler, Charlotte. (Los Angeles, Calif.) **Goal-structure of human life: Model and project.** *Psychol. Rep.*, 1962, 10(2), 445-446.—"An attempt to formulate rationally the goal structure of life and to devise means of testing the hypotheses is described."—B. J. House.

3247. Chambers, J. L., & Broussard, L. J. (Charles Mix Memorial Fund, Americus, Ga.) **The role of need-attitudes in adjustment.** *J. clin. Psychol.*, 1960, 16(4), 383-387.—As a follow up to a previously reported study, this investigation attempted to evaluate attitudes toward needs of the Murray need system of normal, paranoid schizophrenics, alcoholics, and chronic undifferentiated schizophrenic males. The Picture Identification Test adapted by Chambers was employed and the results evaluated via cluster analyses. Interpretation of findings suggested that "in order to conform to normal patterns, alcoholics required most change in attitudes associated with Succorance, Harmavoidance, and Defence needs; paranoid schizophrenics required most change in attitude patterns related to Aggression, Blamavoidance, and Achievement needs; chronic undifferentiated schizophrenics required most change in attitude patterns related to Succorance, Harmavoidance Exhibition, and Order needs."—V. J. Bieleuskas.

3248. Chambers, Jay L. (Charles L. Mix Memorial Fund, Americus, Ga.) **Trait judgment of photographs and adjustment of college students.** *J. consult. Psychol.*, 1961, 25(5), 433-435.—Well-adjusted students (selected by faculty) matched pictures of the Picture Identification Test to Murray need descriptions more closely to average students than did maladjusted students. Relation with Princeton Scholastic Aptitude Test is .28.—E. R. Oetting.

3249. Eysenck, H. J. (U. London, England) **Conditioning and personality.** *Brit. J. Psychol.*, 1962, 53(3), 299-305.—The application of learning theory to the study of personality presents many problems, some of which are here discussed in reply to a critique by Champion of the author's particular contribution to this field. It is suggested that such discussions are relatively fruitless unless they take into account the differences between "strong" and "weak" theories, and unless they bear in mind the many different ways along which predictions may be mediated from postulates.—*Journal abstract.*

3250. Eysenck, H. J. (Inst. Psychiatry, London, England) **Reminiscence, drive and personality:**

Revision and extension of a theory. *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 127-140.—Some 20 studies tend to support the hypothesis that reminiscence effects are stronger in extraverts than in introverts or related hypotheses postulating greater inhibition effects in certain criterion groups. There is little evidence to support the contention that neuroticism or emotionality, presumed to have drive properties, should also correlate positively with reminiscence. The original theory hypothesized that extraverts (a) generate reactive inhibition more quickly, (b) dissipate it more slowly, and (c) develop greater amounts of reactive inhibition. In the light of the work relating drive to reminiscence the 3rd hypothesis becomes unsatisfactory and the theory is therefore reformulated in terms of only the 1st 2 to account for the observed differences between extraverts and introverts in reminiscence. (69 ref.)—C. M. Franks.

3251. Feather, N. T. (U. New England, Australia) **The study of persistence.** *Psychol. Bull.*, 1962, 59(2), 94-115.—An analysis of basic approaches to the study of persistence indicates that trait oriented studies have difficulty in accounting for variation among situations. Conceptualizations of persistence as resistance to extinction have difficulty in accounting for individual differences. A more fruitful approach is to consider persistence as a motivational phenomenon, "where the theory of motivation considers interaction of both personality characteristics and situationally determined influences."—W. J. Meyer.

3252. Feibleman, J. K. (Tulane U.) **An illustration of retention schemata.** *Psychol. Rec.*, 1962, 12, 1-8.—It is proposed that each person has a universe of beliefs composed of private and public retention schemata. The 1st refers to an unconscious and highly personal set of dispositional states. The 2nd encompasses a system of social beliefs used as rules of procedure. Both are acquired as a result of continuing inquiry. Pathology results when an individual is either too labile (insufficient retention) or too stable (nonadaptive or rigid) in his beliefs. The position is developed by illustration in a series of interviews with a single S.—R. J. Seidel.

3253. Fitzgerald, Maureen P. (Fordham U.) **Relationship between expressed self-esteem similarity, and self-disclosure.** *Dissert. Abstr.*, 1962, 22(12), 4402.—*Abstract.*

3254. Forehand, Garlie A. (U. Chicago) **Relationships among response sets and cognitive behaviors.** *Educ. psychol. Measmt.*, 1962, 22(2), 287-302.—The intercorrelations among 12 measures of response set and 6 measures based on concepts of cognitive control were examined. The response set variables were 4 acquiescence scores, 2 measures of response perseveration, extreme positive response tendency, extreme negative response tendency, and general extreme response tendency. 3 of the cognitive control variables involved the concept of equivalence and 3 were based on the concept of field articulation. These are explained and the methods of measuring them are described. 20 articles describing previous work on response set are reviewed, and additional issues are presented.—W. Coleman.

3255. Goldstein, Lawrence. (New York U.) **Empathy and its relationship to personality factors and personality organization.** *Dissert. Abstr.*, 1962, 22(12), 4402-4403.—*Abstract.*

3259. L'Abate, L. (Washington U. Medical School) **The effect of paternal failure to participate during the referral of child psychiatric patients.** *J. clin. Psychol.*, 1960, 16(4), 407.—21 couples (parents) and 27 mothers (not accompanied by their husbands) seeking help from a mental hygiene clinic regarding behavioral problems of their children were given the MMPI. Their children were administered Roger's Test of Personality Adjustment as well as other clinical tests. Control groups consisted of 49 couples of comparable socioeconomic background taken from a recent study by Liverant and 49 children without noticeable behavior problems. "According to differences in MMPI profiles, mothers who brought their child to a mental hospital without their husband appeared to be more disturbed than control mothers who were accompanied by their husbands." Boys who came with only their mothers appeared to be more maladjusted than their controls or the boys who were accompanied by their parents.—V. J. Bieliauskas.

3260. Lair, C. V., & Trapp, E. P. (VA Hosp., Fayetteville, Ark.) **Performance decrement on the H-T-P test as a function of adjustment level.** *J. clin. Psychol.*, 1960, 16(4), 431.—"The hypothesis that more esthetic deterioration from the House to the Person drawings on the H-T-P Test would occur in a maladjusted group compared with a non-maladjusted group was tested. The drawings of 25 paired subjects were rated on artistic quality with no differences found between groups. The implication of this result was briefly discussed."—V. J. Bieliauskas.

3261. Lynn, R., & Butler, J. (U. Exeter) **Introversiion and the arousal jag.** *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 150-151.—Berlyne's theory of the "arousal jag" (see 35: 78) was tested in relation to Eysenck's theory of individual differences in personality as applied to gambling and esthetic preferences among students. The results are consistent with Eysenck's earlier findings but fail to support the theory of Berlyne. A possible way of salvaging the theory is suggested.—C. M. Franks.

3262. McGuire, F. L. (USN Medical Neuropsychiatric Research Unit, San Diego, Calif.) **The Kuder Preference Record—Personal as a measure of personal adjustment.** *J. clin. Psychol.*, 1961, 17(1), 41-42.—An attempt was made to discover the relationship between the interest scales and the personality adjustment. The Kuder Preference Record—Personal, Form A, was given to 2 groups: 50 individuals who were discharged from the Marine Corps for psychiatric reasons, and 38 Marines who had each spent at least 5 years in the Marine Corps. Also the Kuder scores were correlated with the scores on the Bell Adjustment Inventory obtained from 100 Marines picked at random. The results failed to show any significant relationship between the Kuder Preference

Record—Personal measures and the Bell Adjustment Inventory, and they failed to show a difference between the psychiatric and normal military groups.—V. J. Bieliauskas.

3263. Moses, M., & Duvall, R. (U. Texas) **Depreciation and the self concept.** *J. clin. Psychol.*, 1960, 16(4), 387-388.—The Worchel Self-Activity Inventory was administered to 250 students in introductory psychology classes. It was hypothesized that, "persons with high self-ideal discrepancy would tend to depreciate their performance on a task, whereas a person with low self-ideal discrepancy would tend to estimate their performance more accurately." Out of this group, 2 sub-groups were selected of 24 Ss each, one group composed of high self-ideal discrepancy scores and the other of low scores. Both groups were given a 3 choice probability learning task. "It was found that Ss with a high self-ideal discrepancy tended to depreciate their performance, while Ss with low self-ideal discrepancy tended to estimate their performance more accurately."—V. J. Bieliauskas.

3264. Parrish, John Mark. (Indiana U.) **Effects of external control and ambiguous information on generalized expectancy changes for self and others.** *Dissert. Abstr.*, 1961, 22(6), 2070-2071.—*Abstract.*

3265. Radin, Jerome Howard. (New York U.) **Authoritarianism in relation to perceptual performance: The relationship between degrees of acceptance of authoritarianism and space orientation.** *Dissert. Abstr.*, 1962, 22(12), 4427-4428.—*Abstract.*

3266. Rasmussen, John Edward. (American U.) **An experimental approach to the concept of ego identity as related to character disorder.** *Dissert. Abstr.*, 1961, 22(5), 1711-1712.—*Abstract.*

3267. Sax, Gilbert, & Carr, Albert. (U. Hawaii) **An investigation of response sets on altered parallel forms.** *Educ. psychol. Measmt.*, 1962, 22(2), 371-376.—Forms A and B of the Henmon-Nelson were given to 335 freshmen at the University of Hawaii. Students took both the spiral omnibus form and a special form in which the items were divided into 3 subtests. The Ss attempted significantly more items and made significantly higher scores on the spiral-omnibus form than on the subtest form. This suggests a response set dependent upon test format and format of item presentation.—W. Coleman.

3268. Sweney, Arthur B. (Lab. Personality Assessment, U. Illinois) **Human motivation measured by objective tests.** *Psychol. Rep.*, 1962, 10(2), 408.—A discussion of some tests of motivation in adults and children developed with the aid of factor analysis.—B. J. House.

3269. Sweney, Arthur B., & Cattell, Raymond B. (U. Illinois) **Relationships between integrated and unintegrated motivation structure examined by objective tests.** *J. soc. Psychol.*, 1962, 57(1), 217-226.—60 attitudes were measured by 7 objective devices with 300 6th grade public school Ss. The 7 tests were divided into 2 categories integrated and unintegrated on a basis of previous 2nd order analysis. Drive structure, as measured by integrated tests, was compared to that measured by unintegrated tests. Whereas the same drives could be identified in both analyses, the content of the factors differed between studies enough to raise some questions. This differ-

ence is hypothesized to arise from differences in the "level" of measurement. Further studies of this difference must be made to confirm this as the source of variance.—*Author abstract.*

3270. Tollefson, Donald Lloyd. (U. Illinois) Differential responses to humor and their relation to personality and motivation measures. *Dissert. Abstr.*, 1961, 22(5), 1712.—*Abstract.*

3271. Weiss, H. R., Kasinoff, B. H., & Bailey, M. A. (VA Regular Off., NYC) An exploration of reported sleep disturbance. *J. nerv. ment. Dis.*, 1962, 134(6), 528-534.—"A questionnaire constructed to investigate sleep habits and personal data was administered to 108 psychiatric outpatients, 101 medically ill outpatients, and 110 military subjects with no known psychiatric or medical disabilities. The results suggest that reported sleep difficulties are almost exclusively emotional in nature; physical disabilities which are expected to cause complaints in this area failed to elicit reports of sleep difficulty. Such variables as age, unemployment, occupational and educational levels were significantly related to the reporting of sleep disturbance."—*N. H. Pronko.*

3272. Wells, Hal M., & Bell, Deanne M. (Elmira Coll.) Binocular perceptual discriminations of authority and peer group figures among over, under and equal achievers. *J. Psychol.*, 1962, 54(1), 113-120.—6 stimulus presentations of photographs of authority, peer, and neutral figures were shown binocularly in a stereoptic device to over, equal, and under academic achievers. The peer stimulus was recognized most frequently by each of the groups. The over achievers gave the largest number of authority substitutes as responses, and the least frequent accurate recognition of the authority and neutral stimulus. There were no significant differences between equal and under achievers in stimulus recognition, although perceptual distorting occurred in each group in terms of substitutions, structural changes, and the addition of descriptive features to the stimuli. A generalization pattern also occurred in which the observers indicated the presence of a past stimulus no longer present.—*Author abstract.*

3273. Whitehorn, John C. (Johns Hopkins U., Baltimore, Md.) A working concept of maturity of personality. *Amer. J. Psychiat.*, 1962, 119(3), 197-202.—Within a biosocial frame of reference, a 4-stage scheme is offered for characterizing immature levels of personality functioning both for theoretical as well as clinical purposes.—*N. H. Pronko.*

3274. Wohl, J., & Williams, M. (VA Mental Hygiene Clinic, Detroit) Expressed values in two clinical populations. *J. clin. Psychol.*, 1961, 17(1), 92-94.—40 Ss, 20 Patients of VA outpatient clinic and 20 successful business managers were asked the question, "What do you want out of life?" Their answers were verbatim recorded, and the results were evaluated with the Sign Test. The prediction that the less-successful, less-gratified VA patients would respond with more emphasis on health concern, basic present security, a desire for happiness, and self-oriented social needs than would the successful business managers was supported by significant findings. The out-patient group also made more negative or denial responses compared with the control group.—*V. J. Bieliauskas.*

Anxiety

3275. Alexander, Sheldon, & Husek, Theodore. (U. California, Los Angeles) The anxiety differential: Initial steps in the development of a measure of situational anxiety. *Educ. psychol. Measmt.*, 1962, 22(2), 325-348.—"Two studies involving the development and cross-validation of a measuring instrument for situational anxiety were described." 6 exploratory anxiety scales were constructed on the basis of comparisons between anxious and nonanxious Ss. "Partial evidence for the validity of the scales was described. The second study attempted to cross-validate and refine the Anxiety Differential measures. . . . The anxiety measures were further refined, leading to the development of several tests to be used with different experimental designs. A number of advantages and possible limitations of the Anxiety Differential were also discussed."—*W. Coleman.*

3276. Bendig, A. W. (U. Pittsburgh) The reliability and factorial validity of the IPAT Anxiety Scale. *J. gen. Psychol.*, 1962, 67, 27-33.—The 40-item Institute for Personality and Ability Testing (IPAT) Anxiety Scale was administered to 200 college Ss (100 men and 100 women) and reliabilities were computed for the 18 possible subscores from the inventory. The items were intercorrelated as were 10 independent subscore measures of the 5 1st-score factors measured by the inventory, and each matrix was factor analyzed. 5 centroid factors were extracted from each matrix and rotated to oblique simple structure using the analytic oblimax criterion. The reliabilities of the subscores, particularly the "covert" measures of the factors, were low to moderate and suggested that the "covert" items did not greatly improve the reliability of the scores obtained by using the "overt" items alone. The oblique factor structure of the items and of the subscores did not parallel the purported factor structure and it was suggested that the small and unequal numbers of relatively unreliable items for each of the 5 factors preclude any internal validation of the factor structure of the scale.—*Author abstract.*

3277. Boone, Jerry Neal. (Vanderbilt U.) A study of the effects of anxiety on auditory perceptual response to threat. *Dissert. Abstr.*, 1961, 22(6), 2062-2063.—*Abstract.*

3278. Hammes, J. A. (U. Georgia) Manifest anxiety and perception of environmental threat. *J. clin. Psychol.*, 1961, 17(1), 25-26.—"A modified version of the Heineman Forced-Choice Anxiety Scale was given to 169 college students, from whom 27 low-scoring and 27 high-scoring subjects were selected. These individuals evaluated 38 environmental objects on a 7-point scale in terms of a 'danger-aggression-threat' dimension." The results showed that the high-anxious individuals tended to evaluate environmental stimuli higher than the low-anxious individuals.—*V. J. Bieliauskas.*

3279. Hammes, J. A. (U. Georgia) Perceptual defense as a function of manifest anxiety and color. *J. clin. Psychol.*, 1961, 17(1), 27-28.—106 students in introductory psychology classes were used as Ss for this study. 18 high- and 18 low-anxiety Ss chosen on a scale of manifest anxiety, were presented ambiguous drawings, tachistoscopically flashed at $\frac{1}{60}$ second through red and blue color filters. The results indicated that all Ss tended to avoid the choosing of

dangerous, aggressive, and threatening objects as they were flashed under the red filter, but "under both color conditions high-anxious Ss selected a relatively greater number of such objects than did low-anxious individuals." Findings were related to color and perceptual defense.—*V. J. Bieliauskas.*

3280. Haywood, Herbert Carlton. (U. Illinois) **Novelty-seeking behavior as a function of manifest anxiety and physiological arousal.** *Dissert. Abstr.*, 1962, 22(5), 1709-1710.—*Abstract.*

3281. Hunt, W. A., & Blumberg, S. (Northwestern U.) **Manifest anxiety and clinical judgment.** *J. clin. Psychol.*, 1961, 17(1), 8-11.—From an introductory psychology class of 200 students to whom the MA scale had been administered, the 20 highest scoring students and 20 lowest scoring were selected and asked to rate 21 schizophrenic vocabulary test responses on a 7 point scale for organization of thinking. This procedure was repeated 6 times and the results indicated clearly that the learning progressed on the 6 trials. The high-anxious group was significantly inferior to the low-anxious group at the beginning, with this difference diminishing with practice.—*V. J. Bieliauskas.*

3282. Krause, Merton S., & Pilisuk, Marc. (Family Service, Cincinnati, O.) **Anxiety in verbal behavior: A validation study.** *J. consult. Psychol.*, 1961, 25(5), 414-419.—Among 7 speech disruption categories, intrusive nonverbal sounds, mainly laughs and sighs, predicted the Ss' reported feelings of anxiety to a description of a stress situation.—*E. R. Oetting.*

3283. Pylyshyn, Z. W., & Agnew, J. N. (U. Saskatchewan) **Absolute judgment of distance as a function of anxiety and exposure time.** *Percept. mot. Skills*, 1962, 14(3), 411-418.—A group of college students with high Manifest Anxiety Scale scores and low MAS Ss were given the task of making absolute judgments of distance, using tachistoscopically presented displays of short and long duration. There was a significant interaction between MAS and exposure on 2 measures of performance and no evidence of response bias difference. The direction of the interaction was opposite to that reported in several previous studies. A possible explanation is offered in terms of the difference in the "kind" of information present in the display.—*W. H. Guertin.*

3284. Scofield, R. W., & Rankin, R. J. (Oklahoma State U.) **Anxiety and visual acuity.** *Percept. mot. Skills*, 1962, 14(1), 18.—The 1st hypothesis that the different illuminating conditions of the room (light vs. dark) would produce a significant difference between visual acuity responses of high anxious and low anxious Ss was not supported. The 2nd hypothesis that anxiety level would be a significant variable in discriminating visual acuity responses was supported. These preliminary findings suggest further research in this area.—*W. H. Guertin.*

3285. Tarnóczy, Thomas H. (Hungarian Acad. Sciences, Budapest) **Vowel format bandwidth and synthetic vowels.** *J. Acoust. Soc. Amer.*, 34(6), 859-860.—This note summarizes a previous paper by the author (see *Arch. Sprach- Stimmphysiol.*, 1942, 6(3-4), 75-87) on the determination of vowel formant bandwidth from decay patterns of vowel cavities. Formant bandwidth, as well as frequency of formant, depends on the open or closed condition of the glottis.

The tuning of the resonator cavities changes, therefore, during each vibration period within the natural intonation.—*A. M. Small, Jr.*

Defenses

3286. Abrams, S. (Camarillo State Hosp.) **A refutation of Eriksen's sensitization: Defense hypotheses.** *J. proj. Tech.*, 1962, 26(3), 259-265.—"This study demonstrated that Eriksen's sensitization—defense dichotomy exists only in some circumstances, and the defensive method used is not constant but varies with the stimulus situation." The ability of the Rorschach to detect unconscious hostility in repressed Ss and response variation of Ss is discussed.—*A. Greenwald.*

3287. Anton, Arthur Morris. (U. Buffalo) **Consistency versus inconsistency of defensive behavior.** *Dissert. Abstr.*, 1961, 22(4), 1246.—*Abstract.*

3288. Breger, Louis, & Liverant, Shepard. (Ohio State U.) **Homosexual prejudice and perceptual defense.** *J. consult. Psychol.*, 1961, 25(5), 459.—Reaction time is significantly higher to homosexual and sexual words than to neutral words for both high and low scorers on a scale for manifest attitudes toward homosexuality. Fraternity men and applied majors score higher on this scale than nonfraternity men and liberal arts majors. Discussion suggests stereotyping rather than perceptual defense.—*E. R. Oetting.*

3289. Brown, William P. (U. London) **Conceptions of perceptual defence.** *Brit. J. Psychol. monogr. Suppl.*, 1962, No. 35, 107 p.—Following a detailed review of the experimental evidence available concerning possible systematic relationships between how emotionally disturbing a stimulus is for any S and his recognition threshold for that stimulus, the explanatory adequacies of some 10 distinctive theoretical positions are assessed. In an experiment involving 96 students word-recognition thresholds were analyzed in terms of sex and the E and N scales of the Maudsley Personality Inventory. Finally, a tentative behavior theory explanation of perceptual defence phenomena is advanced. (243 ref.)—*C. M. Franks.*

3290. Byrne, Donn. (U. Texas) **The repression-sensitization scale: Rationale, reliability, and validity.** *J. Pers.*, 1961, 29(3), 334-349.—"Work in the area of perceptual defense has led to the concept of a behavior dimension comprising psychological defenses ranging from regression to sensitization. Several scales of the MMPI have been found to be related to this dimension, and the present test consists of a combination of six of these scales." Normative data for this R-S scale are presented from a college population. Concurrent and/or construct validity for the R-S scale is supported by a series of correlational studies with Ullmann's Facilitation-Inhibition scale, the California F scale, and other measures. "Thus, the R-S scale appears to be a reliable test, and . . . the evidence suggests that it is a measure of defensive behavior." (50 ref.)—*G. T. Lodge.*

3291. Coleman, P. (Wayne State U.) **Effect of distracting words on a size estimation task.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 79-80.—"The present study controlled the response suppression, frequency of occurrence, and configuration of stimulus variables. Using the method of absolute judgment, Ss had to estimate the length of various lines and to ignore words which were printed adjacent to the lines.

Words considered to have reward, tabu, or neutral connotations were employed and were hypothesized to exercise differential distraction effects resulting in differential errors in size estimation. . . . the contiguous presentation of meaningful, but task irrelevant, stimuli [has] . . . little effect."—G. Frank.

3292. Duffy, Michael Lee. (U. Washington) **An alternative explanation of the subception phenomenon.** *Dissert. Abstr.*, 1961, 22(5), 1721.—*Abstract.*

3293. Goldstein, M. J., Himmelfarb, S., & Feder, Walda. (U. California, Los Angeles) **A further study of the relationship between response bias and perceptual defense.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 56-62.—Ss were exposed to tachistoscopically-presented pairs of words and asked to report whether a particular word was on the left or right of a fixation point. A non-statistically-significant trend showed that Ss tended to demonstrate a response bias in terms of reporting anxiety or neutral words on one or the other side whether or not they were in fact on the stated side of the point. A 2nd phase of the experiment presented S with blank stimulus fields although S was expecting words. A response bias was not demonstrated. ". . . it is suggested that the use of a forced-choice spatial indicator of perception may undermine the motivational basis for perceptual defense."—G. Frank.

3294. Gordon, Rosemary. (U. London) **Stereotypy of imagery and belief as an ego defence.** *Brit. J. Psychol. monogr. Suppl.*, 1962, No. 34. 96 p.—An experimental investigation of the nature of stereotyped mental constructs and some of the conditions which favor their production in neurotic and normal Ss. It is concluded that the tendency to stereotypy is facilitated by the effects of inadequate intelligence, aging, and neuroticism. The hypothesis is advanced that stereotypy appears in response to and as a defense against anxiety. Facilitating social conditions and social effects of stereotypy are discussed along with methods of possibly reducing this tendency. (36 ref.)—C. M. Franks.

3295. Kragh, Ulf. (Lund U.) **Precognitive defensive organization with threatening and non-threatening peripheral stimuli.** *Scand. J. Psychol.*, 1962, 3(2), 65-68.—The question is raised whether "precognitive defensive organization" in the tachistoscopic exposure of pictures with a centrally placed "hero" and a "threatening" peripheral face is due to the diffuse character (ambiguity) of stimulus, or rather to subliminal threat. 2 pictures were shown under essentially identical conditions. In one case, the face was ugly and "threatening," in the other case it was the same face but slightly modified, and "smiling." The results suggest that subliminal threat is important for the activation of defensive reactions, but they do not contradict the assumption that diffusivity of stimulus alone may also be effective.—*Journal abstract.*

3298. Leveton, A. F. **Reproach: The art of shamesmanship.** *Brit. J. med. Psychol.*, 1962, 35(2), 101-111.—"A reproach is an interaction in which shaming is used to extort behaviour. It takes place between people who have shared expectations and ideals. The shaming is done through the masochistic display of the reproacher who blames his self-inflicted injury on the reproached person hoping to manipulate his behaviour. It may be used to educate children, as when a mother reproaches her child for not eating, or pathologically in the families of schizophrenics. Although it creates discomfort, both partners are reluctant to give up the interaction because it promises power and creates a relationship. Reproach may also go on internally as in the self-reproach of depression and existential reproach. It is a covert transaction that is a common therapeutic problem and must be interpreted in treatment."—C. L. Winder.

PSYCHOANALYTIC THEORY

3304. Aronoff, Joel. (Brandeis U.) **Freud's conception of the origin of curiosity.** *J. Psychol.*, 1962, 54(1), 39-45.—An attempt has been made to examine Freud's writings and to present his ideas on the nature of human curiosity. This is an extremely important task now when his work is being used in support of many different theories of curiosity. 2 contrasting theories may be found. The 1st maintains that curiosity is one of the somatically based partial instincts and emerges during the anal-sadistic stage of development. This is a conception of an innate capacity of the organism, basically concerned with sexual matters, which will continue into adulthood as a derivative instinct. The 2nd theory states that curiosity is not inherent in the organism at all. It is rather a coping mechanism developed by the child to handle the problems raised by the birth of a younger sibling. The conceptual bases for the contrasting theories are presented, as well as a number of Freud's statements, in order to

reveal clearly the nature of his ideas.—*Author abstract.*

3305. Burchard, Edward M. L. (Queens Coll., Flushing) **Psychoanalysis, cultural history and art.** *Psychoanal. psychoanal. Rev.*, 1958-59, 45(4), 99-104.—The growth of psychoanalysis is rooted in the major adaptational problems of the 19th century, i.e., deracination, secularization, restraint of violence and sexuality, and the popularity of healing cults. Psychoanalysis also reflects the preoccupations of 19th-century literature—the novel of education and development, analytic self-observation, and romantic libertinism. Parallels may also be drawn between current psychoanalytic practice and the contemporary avant-garde literature of noninvolvement, abstract painting, and nonorganic sculpture.—*Author abstract.*

3306. Caruso, Igor A. **Soziale Aspekte der Psychoanalyse.** [Social aspects of psychoanalysis.] Stuttgart, Germany: Klett, 1962. 89 p. DM 12.80.—4 lectures on the human motivations resulting from the dialectic relationships of social conditions and psychoanalytically conceived needs are collected in this small volume. The discussion is illustrated by means of case notes, social statistics, and recent European historical events, particularly relating to the Jewry. The theoretical position represents a very liberal interpretation of orthodox psychoanalysis.—*J. C. Brengelmann.*

3307. DeGrinberg, Rebeca V. **Sobre la curiosidad.** [On curiosity.] *Rev. Psicoanal.*, 1961, 18(4), 321-336.—"In this paper a study is made of curiosity as an instinctive drive and of the characteristics of the bond that tends to come about between the curious subject and the object of his curiosity."—*C. T. Morgan.*

3308. Gilbert, A. R. (Norton, Mass.) **The concept of life-style: Its background and its psychological significance.** *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 97-107.—It is hypothesized that the crucial concept in Adler's personality theory was the concept of the life-style and that in order to understand the meaning of this Adlerian concept one must understand the meaning of the concept of life-style to European psychologists. Life-style could be considered as any other style in our music, literature, painting. "If once the personal style-of-life is crystallized, it becomes the unifying, directional impulsion of personality, underlying all its concrete manifestations. Understanding personality means then its style of life." The Adlerian concept of life-style is a complex of cultural concepts which is to be understood properly only in studying the factors which have influenced the development of the personal style-of-life of Adler. There are 2 elements which are of special interest to psychologists: the perception of life-style and the description of life-style. The author suggests that the improvement of life-style should also be of special interest to psychologists.—*V. J. Bieliauskas.*

3309. Grange, Kathleen M. (U. California Medical Cent., Los Angeles) **Samuel Johnson's account of certain psychoanalytic concepts.** *J. nerv. ment. Dis.*, 1962, 135(2), 93-98.—The thesis is developed that Samuel Johnson's writings in the mid-eighteenth century anticipated the works of the 19th century German philosophers which some scholars claim to be the direct intellectual antecedents of Sigmund Freud.

Concepts such as ego, superego, unconscious, frustration, repression are illustrated in his works.—*N. H. Pronko.*

3310. Heigl, Franz. (Beethovenstr. 25, Göttingen, Germany) **Die humanistische Psychoanalyse Erich Fromms.** [The humanistic psychoanalysis of Erich Fromm.] *Z. psycho-som. Med.*, 1961, 7(4), 235-249.—Fromm's humanistic psychoanalysis is anthropocentric not in the sense of man's being the center of the universe, but in a sense that all manifestations of life are rooted in the peculiarity of human existence. Man is the measure of all things. The highest value is man's well-being, but not in a hedonistic meaning of the word. Freudian psychoanalysis cannot be considered a humanistic psychoanalysis because it believes that libido with its derivatives and deviations represents the propelling force in man. Humanistic psychoanalysis teaches that man's strongest drives and passions originate in man's necessity to solve the problems, discrepancies, and dichotomies specific in human existence.—*J. Neufeld.*

3311. Klein, Melanie. **Das Seelenleben des Kleinkindes und andere Beiträge zur Psychoanalyse.** [The mental life of the infant and other contributions to psychoanalysis.] Stuttgart, Germany: Ernst Klett, 1962. 203 p. DM 19.00.—The book contains 8 of the author's papers, most of which were originally published in English. Topics covered are: psychoanalytic play technique, the significance of symbol formation for ego development, the psychogenesis of manic-depressive states, mourning and its relation to manic-depressive states, remarks on some schizoid mechanisms, the theory of anxiety and the sense of guilt, the mental life of the infant, and envy and gratitude.—*H. H. Strupp.*

3312. Lidz, Theodore. (Yale U. School Medicine, New Haven, Conn.) **The relevance of family studies to psychoanalytic theory.** *J. nerv. ment. Dis.*, 1962, 135(2), 105-112.—Data from recent studies of the family show that a number of psychoanalytic concepts "appear to require re-working."—*N. H. Pronko.*

3313. Luquet, Pierre. **Les identifications précoces dans la structuration et la restructuration du moi.** [Early identification in ego structuration and restructuration.] *Rev. Franc. Psychoanal.*, 1962, 26(1), 117-315.—A historical review precedes the presentation: nature, function, and results of early identification; metapsychological perspectives; insertion of early identification in the first step of ego development; and identification in cure.—*G. Rubin-Rabson.*

3314. Madison, Peter. **Freud's concept of repression and defense: Its theoretical and observational language.** Minneapolis, Minn.: Univer. Minnesota Press, 1961. 205 p. \$4.75.—Repression and defense refer to the hypothesized interplay of force and counterforce in psychic life. Part I presents an account of Freud's theory of repression and defense so that in Part II this theory can be formulated in clear and consistent terms at the abstract level and this theoretical language can then be related to an observational language referring to events directly perceived. Crucial hypotheses to be tested to validate the theory of repression and defense are that primal repressions exist in childhood, that adult repressions exist, and that adult repression and childhood repression are causally related.—*D. Prager.*

3315. Pongratz, L. (Hauptstr. 242, Heidelberg, Germany) *Frühkindliche Prägung und Charakterentwicklung*. [The formation during early childhood and the development of personality.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-4), 314-324.—The personality theory of Freud and his disciples suggests that the formation of personality is given the basic foundation during the early childhood. Since children in this period are, in most instances, completely subject to the educational methods of their parents, the Freudians have strongly emphasized the responsibility of the parents, especially the mothers, in regard to the personality formation of their children. However, the field examination of various Freudian and psychoanalytic concepts concerning personality development suggests that "the first formation is not the end formation," and therefore, the influence of the early educators, especially the mothers, could not be considered the only and ultimate influence upon the personality development of the child. Other influences, particularly the environmental, are effective.—V. J. Biliuskas.

3316. Salzman, Leon, & Masserman, Jules H. (Eds.) *Modern concepts of psychoanalysis*. New York: Philosophical Library, 1962. 210 p. \$4.75.—Contains 12 papers as follows: Leon Salzman, "Modern Concepts of Psychoanalysis"; John R. Reid, "Psychotherapy and Values"; F. Ashley Montagu, "Man—and Human Nature"; Carney Landis, "Psychoanalysis and Experimental Psychology"; Jurgen Ruesch, "Science, Behavior, and Psychotherapy"; Nolan D. C. Lewis and Frances E. Cheek, "Psychoanalysis and Social Science"; Harold Kelman, "Psychoanalysis and Existentialism"; John A. P. Millett, "The Changing Faces of Psychoanalytic Training"; Edith Weigert, "Sympathy, Empathy and Freedom in Therapy"; Jules H. Masserman, "Transference: Counter and Countered—A Dialogue"; H. Guntrip, "Object-Relations Theory and Ego-Theory"; and Judd Marmor, "A Reevaluation of Certain Aspects of Psychoanalytic Theory and Practices."—C. J. Adkins.

3317. Sternegger, Benedikt. *Das Ich im Menschen*. [A psychological analysis of the ego.] Munich, Germany: Max Hueber, 1962. 42 p.—The ego, as the "key to the human personality" and accessible to introspection only, is analysed on the basis of speculative European systems.—J. C. Brengelmann.

3318. Voth, Harold M. (Menninger Found.) *Ego-autonomy, autokinesis and recovery from psychosis*. *Arch. gen. Psychiat.*, 1962, 6(4), 288-293.—A medium position on the ego-close-ego-distant continuum referring to the ego's distance from the external environment and measured by amount of autokinetic movement is shown to predispose psychotic patients to faster recovery than those on either extreme of the scale. Reduction of movement was demonstrated to correlate with recovery. Clinical observation indicates that diminution of ego-closeness correlates positively with recovery. For optimal functioning the ego requires an optimal relationship between itself, external reality, and the id corresponding to an intermediate position on the continuum.—L. W. Brandt.

3319. Yonker, Nicholas Junior. (Columbia U.) *Ambiguities of love: An inquiry into the psychology of Erich Fromm*. *Dissert. Abstr.*, 1961, 22 (4), 1245.—Abstract.

3320. Zellinger, E. (U. Munich) *Ausdruck, Symbol und Motiv in der Tiefenpsychologie und psychosomatischen Medizin*. [Expression, symbol, and motive in depth psychology and psychosomatic medicine.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 66-81.—The expression and the symbol represent important forms of disclosure of inner psychological experiences and they also provide the possibility for the study and research of these inner psychological processes. This becomes especially important when one realizes that the expression and symbols communicate also to a psychological researcher reasons for certain actions. These reasons, or in an "American sense," motives, are of great importance in personality studies. In view of this the author attempts to study the various symbols and expressions conveyed to the observer in terms of physical and social actions; examines the change of the meanings of the symbols, paying special attention to the suggestions of C. G. Jung. In addition to other considerations attention is given to the temporal and spatial experiences of the symbols and expressions. The contributions of Freud, Klages, Glatzel, Glover, Hofstätter, Martini, Cushing, Speer, Storck, and others are summarized and critically evaluated. Some consideration is given to the studies of psychosomatic medicine and the relations to expression, symbol and motivation.—V. J. Biliuskas.

PHYSIOLOGICAL CORRELATES

3321. Abe, Kazuhiko, & Wada, Kikuo. (Osaka City Medical School, Japan) *Significance of some anthropometric indices in early childhood with special reference to mental health problems*. *Folia psychiat. neurol. Jap.*, 1961, 15(3), 200-205.—Within a sample of 300 3-year-olds, a negative correlation was found between the index ponderalis (the cube root of weight divided by height) and indices of social, intellectual, and motor development.—W. A. Wilson, Jr.

3322. Fishman, Jacob R., Hamburg, David A., Handlon, Joseph H., Mason, John W., & Sachar, Edward. (National Inst. Mental Health) *Emotional and adrenal cortical responses to a new experience: Effect of social environment*. *Arch. gen. Psychiat.*, 1962, 6(4), 271-278.—"The results of this study indicate that urinary excretion of 17-hydroxycorticosteroid fluctuates in association with emotional responses of mild-to-moderate intensity, comparable to the distress experiences of ordinary living" and "suggest that factors in the current social environment may have a significant bearing upon emotional and adrenocortical responses to a potentially threatening new experience."—L. W. Brandt.

3323. LaDou, J., Ellman, G. L., Callaway, E., III, Edminster, I. F., & Christensen, R. L. (U. California, San Francisco) *Correlates of manifest anxiety*. *J. psychosom. Res.*, 1962, 6(1), 41-47.—49 males (24 psychiatric cases and 25 prisoners) were compared on 4 indices of anxiety: psychiatric rating, MMPI Pt scale, arm lift after contraction, and hippuric acid index (using the fluorimetric method). Ratings correlated .55 with the hippuric acid index (HAI) and .52 with the Pt scale. Mean HAI for the positive and negative arm lift groups were significantly different. Prison and patient populations differed significantly in both HAI and arm lift.—W. G. Shipman.

THERAPY & GUIDANCE

3324. Kraepelin, Emil. One hundred years of psychiatry. (Trans. by W. Baskin.) New York: Citadel, 1962. 163 p. \$4.75 (cloth), \$1.75 (paper).—An essay describing psychiatric treatment and theory in the 19th century. Translated from the 1917 German edition.—R. S. Harper.

3325. Zuk, G. H. (Eastern Pennsylvania Psychiatric Inst.) Relation of mental age to size of figure on the Draw-A-Person Test. *Percept. mot. Skills*, 1962, 14(3), 410.—It was demonstrated in the sample of now defective, problem children that median height of both figures on the D-A-P about doubled from MA 6 to MA 14; median width increased about 50%. The statistically significant findings suggest that size of the figure drawings on the D-A-P can be a useful clue, along with more conventional signs, in determining level of mental functioning in children.—W. H. Guertin.

MEDICAL THERAPIES

3326. de Mille, Richard. (U. Southern California) Intellect after lobotomy in schizophrenia: A factor-analytic study. *Dissert Abstr.*, 1961, 22(5), 1714-1715.—Abstract.

3327. Nemiah, J. C. (Harvard Medical School, Boston) The effect of leukotomy on pain. *Psychosom. Med.*, 1962, 24(1), 75-80.—A 40-year-old paraplegic underwent a leukotomy for intractable pain in his legs. Comparison of pre- and postoperation interviews showed a significant shift from pain to discussion of his situation. The reduction of his capacity to experience affect, particularly anxiety and depression, is proposed as the reason why he now can face his life situation.—W. G. Shipman.

3328. Pippard, John. (Claybury Hosp., Woodford Bridge, Essex, England) Leucotomy in Britain today. *J. ment. Sci.*, 1962, 108(Whole No. 454), 249-255.—Survey of all facilities in Great Britain indicates about 400 operations per year, with many hospitals having none. Selective use for a minority of patients is recommended.—W. L. Wilkins.

3329. Wittenborn, J. R., Plante, Marc; Burgess, Frances, & Maurer, Helen. (Rutgers U.) A comparison of imipramine, electroconvulsive therapy and placebo in the treatment of depressions. *J. nerv. ment. Dis.*, 1962, 135(2), 131-137.—A double-blind study using placebo, ECT, and imipramine on state hospital female patients concluded: "It is possible that imipramine may be more generally efficacious than ECT in the sense that its ameliorating effects appear to influence more aspects of behavior than does ECT."—N. H. Pronko.

Drug Therapy

3330. Barolin, G. S. (Rosenhügel, Vienna) Principes de la psychothérapie sous agents psycholytiques. [Principles of psychotherapy under psycholytic drugs.] *Evolut. psychiat.*, 1962, 27(2), 283-293.—Psychotherapy with the use of LSD 25 (diethylamid of lysagic acid) is explained. Though deep regressions are frequent, therapy is expedited particularly in the area of emotional insights. Tensions or abreactions may outlast therapy. While dramatic results may be obtained rapidly, the therapeutic relationship must be handled more cautiously than in conventional cases. Positive results tend to occur

in alcoholism, anxiety states, homosexuality, and obsessive-compulsive neurosis. In contrast, it does not seem to be effective in borderline states, hysterical structures, neurotic depressions, and aggressive psychopathic personalities.—L. A. Osilund.

3331. Casparis, Lili. Indikationsbereich von Chlordiazepoxyd (librium) und einiger anderer Psychopharmaka im Kindes- und Jugendlichenalter. [Indications for librium and other psychological drugs in children and adolescents.] *Acta paedopsychiat.*, Basel, 1962, 29(5), 129-151.—Children show different, often paradoxical results, from adults to the administration of librium. Useful in psychoreactive disturbances as well as diffuse brain damage, it is contraindicated in instinctual aberrations. It reduces anxiety and mental tension, facilitating concentration and psychotherapy, but is no substitute for the latter.—G. Rubin-Rabson.

3332. Cohen, Bertram D., Rosenbaum, Gerald; Luby, Elliot D., & Gottlieb, Jacques S. (Wayne State U.) Comparison of phencyclidine hydrochloride (Sernyl) with other drugs: Simulation of schizophrenic performance with phencyclidine hydrochloride (Sernyl), lysergic acid diethylamide (LSD-25), and amobarbital (Amytal) sodium; II. Symbolic and sequential thinking. *Arch. gen. Psychiat.*, 1962, 6(5), 395-401.—A proverb interpretation and a serial task were given to 10 chronic schizophrenics and to groups of normal Ss after administration of the 3 drugs. "With drugs, the phencyclidine hydrochloride group scores were significantly inferior to those of the other drug groups and approximated the mean scores of the . . . schizophrenics. LSD-25 and amobarbital sodium produced slight but insignificant decrements in performance."—L. W. Brandt.

3333. Ditman, Keith S., Hayman, Max, & Whitteley, John R. B. (U. California, Los Angeles, Medical Cent.) Nature and frequency of claims following LSD. *J. nerv. ment. Dis.*, 1962, 134(4), 346-352.—A systematic study was made of the personal statements of 74 out of 87 Ss who had one or more administrations of LSD 6 months to 3½ years previously. Claims of improvement were found to be higher for the 1st 6 months than they were after longer intervals, casting doubt on the alleged psychotherapeutic effects of LSD.—N. H. Pronko.

3334. Freedman, Alfred M., Ebin, Eva V., & Wilson, Ethel A. (New York Medical Coll.) Autistic schizophrenic children: An experiment in the use of D-lysergic acid diethylamide (LSD-25). *Arch. gen. Psychiat.*, 1962, 6(3), 203-213.—Previous experiments with LSD-25 on schizophrenics are discussed. 12 autistic children age 6-12 were given LSD-25 in their preferred liquid. Effects lasted from 20 min. after ingestion till 4 hr. later and included "facial flush, dilation of pupils, some catatonia, some ataxia, complete loss of appetite, increased body awareness . . . desire for physical contact . . . rapid mood-swings from elation to depression, anxiety, or flattening of affect, auditory and visual hallucinations, decreased alertness in most but increased alertness in a few, increased remoteness, decreased . . . and increased eye contact and increased vocalization and verbalization. The hoped-for change from muteness to speech did not occur." (17 ref.)—L. W. Brandt.

3335. Garfield, Sol L., Helper, M. M., Wilcott, R. C., & Muffly, R. (U. Nebraska Coll. Medicine, Omaha) Effects of chlorpromazine on behavior in emotionally disturbed children. *J. nerv. ment. Dis.*, 1962, 135(2), 147-154.—39 children, inpatients of the Nebraska Psychiatric Institute, served as Ss in a double-blind study on the effect of chlorpromazine on emotional disturbances. 19 received the drug and 20 received placebos. Ward ratings and clinical ratings were obtained for each S. While a number of statistically significant differences were obtained, "the actual differences obtained in this study were small."—N. H. Pronko.

3336. Hanlon, Thomas E. (Spring Grove State Hosp.) Use of a demographic index score as a control measure in psychiatric drug research. *Psychol. Rep.*, 1962, 10(2), 465-466.—"A modification of the index of Lindemann and his co-workers (see 34: 1886) was used as a control measure in a psychiatric drug research project evaluating the comparative effectiveness of six phenothiazines, phenobarbital, and placebo in the treatment of acutely ill patients, newly admitted to a state psychiatric hospital. Differential action among treatments was increased by the use of the index, but certain characteristics of the data require that the study be replicated on another sample."—B. J. House.

3337. Knobel, Mauricio. (American Child Guidance Clinic, Buenos Aires) Psychopharmacology for the hyperkinetic child: Dynamic considerations. *Arch. gen. Psychiat.*, 1962, 6(3), 198-202.—"The medication-rejecting family" and "the child-rejecting family" are discussed. (16 ref.)—L. W. Brandt.

3338. Le Borgne, Yvon. (Hôpital Psychiatrique St.-Luc, Pau) Potentialisation des cures de sommeil par le carbamate de méthyl-3-pentyne-1-ol-3. [Increased effectiveness of sleep cures with 3-methyl-pentyne-1-ol-3 carbamate.] *Encephale*, 1962, 51(1), 84-94.—A series of 72 cases of various diagnostic categories show that the effectiveness of sleep therapy is increased by combination of the usual barbiturates with MPC. Optimal dosage seems to be 900 mg. MPC with 0.03 mg. of barbiturate.—W. W. Meissner.

3339. Loranger, Armand W., Prout, Curtis T., & White, Mary Alice. (New York Hosp., White Plains, N. Y.) The placebo effect in psychiatric drug research. *J. Amer. Med. Ass.*, 1961, 176(11), 920-925.—A drug investigation involving 120 hospitalized psychiatric patients was simulated. It appeared to participating patients, psychiatrists, and nurses, that a new tranquilizer and a new energizer were to be evaluated, but both "drugs" were actually placebos. According to the uncontrolled and subjective methods of evaluation, 53% to 80% of the patients benefited from the new "drugs." When matched control groups and objective rating scales were used in the evaluation, significant improvement was caused by the tranquilizer but not by the energizer.—Author abstract.

3340. Lorr, M., McNair, D. M., & Russell, S. B. (VA, Washington, D. C.) Characteristics of psychiatric outpatients receiving tranquilizers. *J. clin. Psychol.*, 1960, 16(4), 442-446.—This report presents part of a larger study which included a survey conducted in all VA mental hygiene clinics concerning

the prevalence, judged benefits, and effects of tranquilizers in treatment of the out-patients of these clinics. According to the survey conducted in 63 clinics: (a) patients who receive tranquilizers as the primary source of therapy, as compared with those who receive psychotherapy, are mostly non-high-school graduates and are frequently diagnosed as psychotics; (b) patients receiving psychotherapy and tranquilizers are more frequently diagnosed as psychotics with strong admixtures of anxiety; (c) therapists seem to agree that anxiety, tension, and hostility are the indicators used to indicate tranquilizer treatment; and (d) the patients with a higher educational level are usually included in psychotherapy and their treatment lasts over 1 year.—V. J. Bieleuskas.

3341. Mitchell, L. E., & Zax, M. (VA Mental Hygiene Clinic, Washington, D. C.) Psychological response to chlorpromazine in a group of psychiatric patients. *J. clin. Psychol.*, 1960, 16(4), 440-442.—A total of 69 psychiatric patients, hospitalized for emotional disorders were divided into an experimental and a control group. The groups were matched for age, sex, length of hospitalization, and degree of anxiety as judged clinically. The experimental group was given chlorpromazine for 30 days, while the control group received the usual routine hospital care without ataractic drugs. Both groups were tested at the beginning and end of the experiment using 5 types of objective personality tests (3 anxiety measures and 2 personality trait evaluators of a more enduring nature). Significant differences were found between the experimental and control groups for 2 of the 3 anxiety measures. No significant changes were observed on the other personality tests.—V. J. Bieleuskas.

3342. Munson, R. F., Theobald, W. A., & Griffith, R. M. (VA Hosp., Lexington, Ky.) Effect of ataractic drugs on success of trial visits of long term patients. *J. clin. Psychol.*, 1960, 16(4), 447.—The return rate of chronic patients who received ataractic drugs and who were continuously hospitalized for 2 years and released on Trial Visit status. 56 Ss received tranquilizers while 31 received none. The findings suggested that, "the patients who had not received drugs were more successful in the outcome of the TV's."—V. J. Bieleuskas.

3343. Pletscher, A. (F. Hoffman-La Roche & Co., Basel, Switzerland) Basic aspects of psychotropic drug action. *Amer. J. ment. Defic.*, 1962, 67(2), 238-244.—Many psychotropic drugs used in human therapy influence cerebral monoamines. The various drug effects are probably produced by different mechanisms such as: (a) decrease of the storage capacity of the tissue for monoamines, (b) decrease of the synthesis of monoamines, (c) inhibition of monoamine oxidase, (d) interference with monoamine penetration, and (e) increase of the sensitivity of central nervous receptors for monoamines. Evidence is adduced that these mechanisms may be causative factors for the pharmacodynamic and clinical effects of psychotropic drugs.—V. S. Sexton.

3344. Ross, Sherman; Krugman, Arnold D., Lyerly, Samuel B., & Clyde, Dean J. (VA Cent., Martinsburg, W. Va.) Drugs and placebos: A model design. *Psychol. Rep.*, 1962, 10(2), 383-392.—In a study of the effects of 10 mg. of d-amphetamine, 80 aged male Ss were randomly assigned to one of 4 groups: (a) Drug, (b) Disguised Drug,

(c) Placebo, and (d) Control. Results from the Clyde Mood Scale indicated a positive placebo effect, in the direction of "comfort," a negative effect of Disguised Drug, and a cancellation of these 2 effects in the Drug Group which did not differ from Controls. Both Drug and Disguised Drug Groups showed impaired performance on psychomotor tests measuring speed and accuracy.—*B. J. House.*

3345. **Sibilio, John Paul.** (Michigan State U.) **The effect of perphenazine on focus of attention in schizophrenia.** *Dissert. Abstr.*, 1962, 22(12), 4413-4414.—*Abstract.*

Shock Therapy

3346. **Roos, Philip.** (Texas State Hosp.) **Evaluation of psychotherapy as an adjunct to insulin-coma therapy.** *J. consult. Psychol.*, 1961, 25(5), 450-455.—Ratings from a test battery including the Grayson Perceptualization Test, Kent EGY, Human Figure Drawing Test, Bender-Gestalt, sentence completion test, and a modification of the Wechsler-Bellevue Picture Completion, showed significantly greater improvement when group and individual therapy is used with insulin shock. The Multidimensional Scale for Rating Psychiatric Patients by psychiatric and ward personnel and the Rorschach failed to discriminate. Therapy patients left the hospital sooner than controls.—*E. R. Oetting.*

PSYCHOTHERAPY

3347. **Abi Rafi, A.** (St. Andrew's Hosp., Norwich, England) **Learning theory and the treatment of tics.** *J. psychosom. Res.*, 1962, 6(1), 71-76.—An attempt was made to treat 2 psychiatric patients suffering from tics by the method of treatment proposed by Yates. Very prolonged periods of massed practice followed by very prolonged rest were successful.—*W. G. Shipman.*

3348. **Bromberg, Walter.** **The nature of psychotherapy: A critique of the psychotherapeutic transaction.** New York: Grune & Stratton, 1962. 108 p. \$4.50.—The book is a conceptual analysis of the ultimate nature of psychotherapy, "one of psychiatry's most interesting problems." The primary aim of all forms of psychotherapy is the modification of energy patterns within the personality which underlie mental and emotional symptoms. Thus, the attempted change is always intrapsychic change, and the therapeutic influence is a force, however, conceived, which brings such change about. The patient's "as if" acceptance of the therapist's metaphorical conceptualization probably operates through trust or belief. The importance of symbolic communication in psychotherapy cannot be overestimated. The empirical verification of psychoanalytic hypotheses is not possible with experimental methods common to other sciences.—*H. H. Strupp.*

3349. **Bugental, J. F. T.** (Psychological Service Ass., Los Angeles) **A phenomenological hypothesis of neurotic determinants and their therapy.** *Psychol. Rep.*, 1962, 10(2), 527-530.—"We suggest the psychotherapist will do well to recognize that some perceptions governing a patient's mode of looking at himself and his world are more available to direct and even explicit refutation than others. The difference seems to lie in the former being taken over

as generalizations from others significant to the patient, while the latter grow out of the patient's personal, idiosyncratic, and emotional experiences."—*B. J. House.*

3350. **Cartwright, Rosalind Dymond.** (U. Colorado) **The effects of psychotherapy on self-consistency: A replication and extension.** *J. consult. Psychol.*, 1961, 25(5), 376-382.—Replication and extension of a previous study (see 33: 6330). Previous results are confirmed but controls also increase in self-consistency. On Butler-Haigh Q sort, clients selecting client-centered therapy were more poorly adjusted in self-to-mother image, controls in self-to-father.—*E. R. Oetting.*

3351. **Gebsattel, V. E.** (Bamberg, Germany) **Medizinische Anthropologie.** [Medical anthropology.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 193-198.—In view of the addition of the term "medical anthropology" to this yearbook, the author takes the opportunity to discuss the meaning of medical anthropology and presents an historical survey of the 60 years of conditions which have promoted the concept of medical anthropology. Medical anthropology is a strongly phenomenologically oriented empirical approach to research. It attempts to give special attention in this evaluation to the understanding of physician-patient relations, and to the psychological implications in medical work. The German scientists who are participating in the movement of medical anthropology are named and the special contributions of Freud and von Weizsacker are underlined.—*V. J. Bieliauskas.*

3352. **Gendlin, E. T., & Shlien, J. M.** (U. Wisconsin) **Immediacy in time attitudes before and after time-limited psychotherapy.** *J. clin. Psychol.*, 1961, 17(1), 69-72.—The unforced Q-sort technique was administered to 45 clients in a time-limited client centered therapy to examine the relation between measures of success in psychotherapy and the development of immediacy of experiencing. A correlation between success measures and the pre- and post-therapy scores on the time attitude Q sort showed that a high degree of immediacy characterized the successful client after, but not before, psychotherapy.—*V. J. Bieliauskas.*

3353. **Goldstein, A. P.** (U. Pittsburgh School Medicine) **Patient's expectancies and non-specific therapy as a basis for (un)spontaneous remission.** *J. clin. Psychol.*, 1960, 16(4), 399-403.—Criticisms concerning the effect of psychotherapy have been based in many instances upon the idea of spontaneous remission of patients not included in psychotherapy. In this study mean pre and post MMPI scores of patients included in individual and group psychotherapy were compared with a group of wait-list controls, and no significant differences were found. However, it was noticed that the wait-list patients, though not undergoing formal psychotherapy, were included in pre-therapy testing, social work, and intake interviews. The suggestion is made that all these encounters present a nonstructured therapeutic experience, and therefore it is possible that various evaluation seminars and encounters with nurses and other hospital staff members may have therapeutic effect upon the patient. It may be better to use the term "non-specific therapy remission" because the phrase does more justice to the facts involved.—*V. J. Bieliauskas.*

3354. Göppert, H. (Freiburg, Germany) *Psychotherapie der Angst*. [Psychotherapy of anxiety.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 214-217.—A theoretical distinction is made between the Freudian fear and anxiety, or the real fear and neurotic fear and anxiety. These Freudian concepts are related to those of Kierkegaard and Heidegger, and thus with the existential standpoint concerning anxiety. The freeing of oneself of an edipus situation is considered an existential step, a "second birth." A "second birth" must be realized, however, by the existence itself. In exposing itself to the "second birth," one means to be of oneself; in the courage to face this anxiety one wins his freedom.—V. J. Bieliauskas.

3355. LeShan, Lawrence L. (Inst. Applied Biology) *Changing trends in psychoanalytically oriented psychotherapy*. *Ment. Hyg., N. Y.*, 1962, 46(3), 454-463.—A discussion of a "major change in theory and technique" of psychoanalytically oriented psychotherapy. The author concludes that 5 basic tenets of psychoanalytic therapy (psychic determinism, the absence of value judgments, the therapist as a faceless mirror, the delay of decision making during therapy, and the belief that behavior rests on a balance of pathological forces) appear to be in the process of being either discarded or drastically modified.—M. H. Lewin.

3356. Levi, Aurelia Leffler. (Columbia U.) *Parent treatment and outcome of child's therapy*. *Dissert. Abstr.*, 1961, 22(4), 1255.—Abstract.

3357. Mora, George; DeVault, Spencer, & Schopler, Eric. (Astor Home Children, Rhinebeck, N. Y.) *Dynamics and psychotherapy of identical twins with elective mutism*. *J. child Psychol. Psychiat.*, 1962, 3(1), 41-52.—Mutism was a means of controlling the environment and protecting the twins from awareness and expression of their own hostility. Treatment was aimed at breaking the tie of the "twinship" and encouraging differentiation between these adolescent sisters.—J. M. Reisman.

3358. Quaytman, Wildred. (New York U.) *Motivation for psychotherapy: A comparative investigation of motivational factors in female neurotic outpatients who prematurely terminate and those who remain in psychotherapy*. *Dissert. Abstr.*, 1962, 22(12), 4412.—Abstract.

3359. Raskin, A. (Veterans Benefits Office, Washington 25, D. C.) *Factors therapists associate with motivation to enter psychotherapy*. *J. clin. Psychol.*, 1961, 17(1), 62-65.—Out of 250 cases from 19 VA Mental Hygiene Clinics, 2 samples of 50 cases each were drawn as Ss to clarify the meaning of motivation-to-enter-psychotherapy by identifying the variables therapists associate with this concept. 15 patient and therapist variables were examined; 5 variables were found significantly correlated with the therapist ratings on the motivation scale. "Patients whom therapists rate high on motivation to enter psychotherapy are liked by the therapist a little more or much more than most other patients, have come to the clinic expecting psychotherapy, and have had at least some high school or vocational school training. The only factor consistently associated with low ratings on the motivation scale was the therapists' reports that these patients came to the clinic expecting physical or medical treatment, including drugs."—V. J. Bieliauskas.

3360. Rinsley, Donald B., & Inge, George P., III. (Topeka State Hosp., Kan.) *Psychiatric hospital treatment of adolescents: Verbal and non-verbal resistance to treatment*. *Bull. Menninger Clin.*, 1961, 25(5), 249-263.—Effective treatment of hospitalized adolescents must involve an adequate recognition of the child's efforts to defeat structure and appropriate ways of conveying to the child that recognition has occurred. Devices used to defeat structure are classified and the basic metaphorical messages the child transmits to adult team members are discussed.—W. A. Varvel.

3361. Voth, Harold M., Modlin, Herbert C., & Orth, Marjorie H. (Menninger Found.) *Situational variables in the assessment of psychotherapeutic results*. *Bull. Menninger Clin.*, 1962, 26(2), 73-81.—The psychiatric patient's behavior and relevant environmental events are recorded at the beginning of treatment, at termination, and again 2 years later. Situational variables are classified as conflict triggers, stress, support, opportunity, need-congruence, and mutability. The analysis of the interaction of patient and situational variables provides an essential frame of reference for assessing psychotherapy results. Without it, too much may be attributed to therapy or to changes within the patient.—W. A. Varvel.

3362. Watts, Virginia N. *Effects of therapy on the creativity of a writer*. *Amer. J. Orthopsychiat.*, 1962, 32(1), 186-192.—A description of psychoanalytic psychotherapy with a young homosexual writer indicates the way in which the artist, his work, and his dynamics are intertwined. Successful therapy results in increased creativity and production.—R. E. Perl.

Therapeutic Process

3363. Aleksandrowicz, Dov R. *The meaning of metaphor*. *Bull. Menninger Clin.*, 1962, 26(2), 92-101.—A case is presented in which "speaking the patient's language" was often accomplished by using metaphorical expressions. The patient with schizophrenic thought disorder is apt to use metaphors in a special manner. The "Gestalt of a metaphor is a complex configuration of cognitive and affective elements" which "the therapist cannot expect to comprehend by intellectual grasp alone."—W. A. Varvel.

3364. Enke, H., & Ohlmeier, D. (Landhaus Umkirch bei Freiburg, Germany) *Über die Bedeutung spontaner Bildnerien in der Psychotherapie*. [On the significance of spontaneous creativities during psychotherapy.] *Z. psycho-som. Med.*, 1962, 8(1), 45-48.—Patients' spontaneous artistic creations may be taken as representing their "in-pictures." The significance can properly be grasped if all such creations are interpreted in 3 dimensions: their thematic message projecting the patient's intrapsychic images, experiences, and thoughts; their formal construction depending on the patient's total personality; and the patient's general esthetic ambitions. The scoring of the formal characteristics developed from the graphological categories of Heiss, makes it possible to recognize personality changes during the therapeutic process beyond the therapist's unavoidable involvement in the doctor-patient encounter.—I. Neufeld.

3365. Farson, Richard E. (Western Behavioral Sciences Inst. La Jolla, Calif.) *Introjection in the*

psychotherapeutic relationship. *J. counsel. Psychol.*, 1961, 8(1), 337-342.—Using Butler-Haigh Q sort, clients are not more similar to their own therapist after therapy than to other therapists, but judges could predict therapists whose clients will resemble themselves and those whose clients will not.—*E. R. Oetting.*

3366. Goldman, Jeri Joan Richards. (Stanford U.) **The relation of certain therapist variables to the handling of psychotherapeutic events.** *Dissert. Abstr.*, 1961, 22(5), 1715.—*Abstract.*

3367. Heller, Kenneth, & Goldstein, Arnold, P. (U. North Dakota) **Client dependency and therapist expectancy as relationship maintaining variables in psychotherapy.** *J. consult. Psychol.*, 1961, 25(5), 371-375.—"Results . . . indicated a strong positive relation between client pre-therapy attraction to the therapist and; (a) both clients self-descriptive and behavioral dependency before therapy and; (b) clients self-descriptive but not behavioral movement toward independence." There was also a high relationship between pretherapy attraction and overt post-therapy dependency. Favorable therapist expectation may help in maintaining the therapeutic relationship. Tests used include the Picture Impressions Test, Edwards Personal Preference Schedule and a Situational Test of Dependency. Therapist expectation was measured by Q sort.—*E. R. Oetting.*

3368. Lapkin, Benjamin. (Hillside Hosp., Glen Oaks, N. Y.) **The relation of primary-process thinking to the recovery of subliminal material.** *J. nerv. ment. Dis.*, 1962, 135(1), 10-25.—2 hypotheses were tested: (a) Ss who show primary thinking will show better recovery of subliminal stimuli than Ss who do not, and (b) Ss who show well-controlled primary-process thinking will show greater recovery of substitute stimuli than those with poor control. It is suggested that "the conditions of the study did not allow for an adequate test of the hypothesis."—*N. H. Pronko.*

3369. Rader, G. E. (U. North Carolina) **Rorschach productivity and participation in group psychotherapy.** *J. clin. Psychol.*, 1960, 16(4), 422-424.—Zubin's idea concerning the relationship between interview productivity and Rorschach productivity was extended to the productivity in psychotherapy. 45 state prison inmates were used in this study; mental defectives and obvious psychotics were excluded. The Ss were divided into 6 groups which met weekly with psychiatric residents (Groups I-IV) and psychologists (Groups V-VI) for a discussion. The number of responses, self-expression divided by number of R's, and emotionalization divided by number of R's were used as the 3 Rorschach criteria designating productivity. Therapy participation was evaluated on the gains of 6 rating categories. No significant relationships were found between the 3 measures of Rorschach productivity and the productivity in psychotherapy.—*V. J. Bieliauskas.*

3370. Rickard, H. C., Dignam, P. J., & Horner, R. F. (VA Hosp., Tuscaloosa, Ala.) **Verbal manipulation in a psychotherapeutic relationship.** *J. clin. Psychol.*, 1960, 16(4), 364-367.—3 different experimenters attempted to achieve verbal conditioning in a 60-year-old male who has been hospitalized continuously for over 20 years in a VA Hospital. The first E attempted to condition "the dependent variable,

rational speech, to a high level of occurrence under a high frequency of reinforcement, but the conditioned response dropped sharply when an attempt was made to lower the frequency of reinforcement. E2 exposed the same S to alternating 10 minute periods of 'minimal' and 'maximal' reinforcement and demonstrated conditioning of the same dependent variable. E3 replicated the procedure which E2 had followed and obtained similar results."—*V. J. Bieliauskas.*

3371. Stone, Leo. **The psychoanalytic situation: An examination of its development and essential nature.** New York: International Univer. Press, 1961. 160 p. \$4.00.—Delivered as part of the Freud Anniversary Lecture Series of the New York Psychoanalytic Institute, this book describes the psychoanalytic situation in terms of: the physician-patient relationship, the classical psychoanalytic situation, additional comments on the transference-countertransference complex and the transference neurosis, the primary unconscious meaning of the psychoanalytic situation, and biological and primitive psychological aspects of the psychoanalytic situation. 3 patterns of relationship are discerned: (a) the real and actual integrated personal relationship; (b) the transference-countertransference relationship; and (c) the unique system of routinized activities, deprivations, and prohibitions which are anchored in the psychoanalytic technique. The psychoanalytic setting tends to reproduce, from the outset, the repetitive phases of the state of relative separation from early objects, notably the mother. The analyst, unconsciously, represents the mother-of-separation.—*H. H. Strupp.*

3372. Tagliacozzo, R., & Tolentino, I. **La coazione a ripetere ed il transfert.** [Repetition compulsion and transference.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(3), 197-222.—After a review of the psychoanalytic literature on repetition compulsions, clinical cases are presented to illustrate their reappearance in psychotherapy.—*L. L'Abate.*

3373. Thorne, F. C. (Vermont) **Towards more realistic expectations of psychotherapists.** *J. clin. Psychol.*, 1961, 17(1), 101-102.—Rogers' principle of "unconditional positive regard" and "unconditional" prizing of the client is critically evaluated in an editorial. The question is raised as to what extent the therapist should prize and accept asocial and completely improper attitudes of the client. He also raises the question whether this "unconditional acceptance" and "prizing" is necessary in therapy. The point is made that "some very blunt, outspoken, critically evaluative persons have also made very good therapists."—*V. J. Bieliauskas.*

Group Therapy

3374. Bell, John E. (National Inst. Mental Health, San Francisco) **Recent advances in family group therapy.** *J. child Psychol. Psychiat.*, 1962, 3(1), 1-15.—An application of small group theory to understanding and producing change in the family unit by: (a) increased intercommunication, (b) greater flexibility in roles and functions, and (c) greater discipline in the choice and form of relationships. (108-item bibliogr.)—*J. M. Reisman.*

3375. Friedman, Alice R. (Harlem Valley State Hosp., Wingdale, N. Y.) **Education as part of a group therapy program.** *Ment. Hosp.*, 1962, 13(5), 274.—*L. Gurel.*

3376. Grunebaum, H. Group psychotherapy of fathers: Problems of technique. *Brit. J. med. Psychol.*, 1962, 35(2), 147-154.—"The 'strategy' of group psychotherapy is that the leader does not gratify the infantile needs of the members, but rather 'gives' to them increased understanding through clarification and interpretation of their feelings towards each other and towards the leader. This therapeutic aim can only be accomplished in the context of a strong and positive therapeutic alliance between the group and the leader. A 'positive alliance,' as manifested in a warm emotional climate and free and active participation, may be fostered by dealing with three clinical problems arising in the course of the group. Each of these seems particularly associated with a different phase of the group, although, of course, there is a great overlap."—C. L. Winder.

3377. Rickard, Henry C. (U. Alabama) Selected group psychotherapy evaluation studies. *J. gen. Psychol.*, 1962, 67, 35-50.—The literature is replete with qualitative descriptions of the outcome of group psychotherapy, but quantified, well controlled evaluation studies remain few in number. 22 articles were reviewed which met the minimal requirements of a control group and at least one objective criterion of improvement. Each experiment is described in moderate detail with only minimal evaluative comment. Elements of the experiments consistently examined were: population, matching, design, outcome, and criteria of improvement. A general critique is offered at the end.—*Author abstract.*

3378. Slavson, S. R. A critique of the group therapy literature. *Acta psychother. psychosom., Basel*, 1962, 10(1), 62-73.—The literature reflects the confusion that exists in individual therapy, since the same practitioners do both types of treatment. As a new field, bizarre doctrines and practices appear. Most therapists are engaged in neo-Freudian practice, using techniques different from classical psychoanalysis. The need is for valid research.—G. Rubin-Rabson.

Special Therapies

3379. Sylvander, Inga. Beskrivning av en jagstödande psykoterapi. [Description of an ego-supporting psychotherapy.] *Nord. Psykol.*, 1962, 14(3), 109-167.—The treatment of a 6-year old boy with severe adjustment difficulties due to defective ego functions is detailed. The case illustrates the use of ego-supporting techniques as distinguished from "depth" techniques in which ego-regression is fostered. The theoretical and technical distinctions between these 2 modes of psychotherapy are discussed. (English summary)—L. Goldberger.

3380. Walton, D. (Winwick Hosp., Warrington, Lancaster, England) The application of learning theory to the treatment of a case of somnambulism. *J. clin. Psychol.*, 1961, 17(1), 96-99.—The reciprocal inhibition technique described by Wolpe was applied on a case of a potentially dangerous somnambulist. The case history and method of therapy is described in the follow-up report. A special program in applying the principle of reciprocal inhibition was arranged for the patient during one interview and a rapid and positive response to this treatment was reported. A 2-year follow-up did not show a return of the condition or any other symptoms associated with it.—V. J. Bieliauskas.

3381. Wolpe, Joseph. (U. Virginia School Medicine, Charlottesville) Isolation of a conditioning procedure as the crucial psychotherapeutic factor: A case study. *J. nerv. ment. Dis.*, 1962, 134(4), 316-329.—A patient with a single severe phobia for automobiles was treated. A deconditioning technique systematic desensitization was correlated with improvement that was quantitatively related to the number of reinforcements given.—N. H. Pronko.

HYPNOSIS

3382. As, Arvid. (Oslo U.) Non-hypnotic experiences related to hypnotizability in male and female college students. *Scand. J. Psychol.*, 1962, 3(2), 112-121.—Some recent research on the relation between subjective experiences and hypnotic susceptibility is reviewed. In a male sample of 50 Ss significant correlations between scores on the author's Experience Inventory (see 37: 1448) and hypnotizability were found. A cross-validation of composite experience scores on this sample and a female sample studied earlier gave positive results. Based on several sources of data a preliminary analysis is made of the similarities and differences between male and female students regarding experiences related to hypnotizability.—*Journal abstract.*

3383. Barber, Theodore X. (Medfield State Hosp., Mass.) Experimental controls and the phenomena of "hypnosis": A critique of hypnotic research methodology. *J. nerv. ment. Dis.*, 1962, 134(6), 493-505.—Experiments are criticized for their failure to control the following variables: those pertaining to the S, prior training, interest in the experiment, motivation to do well on the criterion task, S-E relationship, and the definition of the situation to the S.—N. H. Pronko.

3384. Ferster, C. B., Levitt, E. E., Zimmerman, J., & Brady, J. P. The measurement of hypnotic effects by operant-reinforcement techniques. *Psychol. Rec.*, 1961, 11, 427-430.—Matching-to-sample technique was used where S was reinforced for pressing a key under a stimulus which did not match the sample which had disappeared. Differing error rates and amounts were obtained with varying instructions under hypnosis. The technique is proposed as useful for studying many variables relating to hypnosis; e.g., duration of effectiveness of suggestion and relative efficiency of various hypnotic techniques.—R. J. Seidel.

3385. London, Perry. (U. Illinois) Hypnosis in children: An experimental approach. *Int. J. clin. exp. Hypn.*, 1962, 10(2), 79-91.—Based on the Stanford Hypnotic Susceptibility Scale, the Children's Hypnotic Susceptibility Scale, a standardized induction procedure for children 5 years and older, was developed. Interscorer and retest reliability was high. 2 scoring systems are employed, one measuring overt behavior and the other subjective involvement. Comparing children to college students on items, children were found significantly more susceptible. A linear relationship was found between age and simulation ability. A suspected curvilinear relationship may be a function of confounding simulation ability and motivation with hypnotic behavior.—C. S. Moss.

3386. London, Perry, & Fuhrer, Marcus. (U. Illinois) Hypnosis, motivation, and performance. *J. Pers.*, 1961, 29(3), 321-333.—16 hypnotically sus-

ceptible and 16 relatively unsuceptible female Ss, by the Stanford Hypnotic Susceptibility Scale, performed on a hand dynamometer, a weight-holding task, and a tremor test in both a hypnotized and an un hypnotized state. During the next session, the same procedures were followed, but in addition, the Ss were strongly exhorted to perform at their maximum. "A manifestly surprising finding was that the performance of hypnotically unsuceptible Ss was consistently superior to that of highly susceptible Ss for all conditions on both the weight-holding and dynamometer tasks." Unsuceptible Ss performed best when un hypnotized, susceptibles when hypnotized. "Motivational instructions are clearly more important than the hypnotic trance."—G. T. Lodge.

3387. Moore, Rosemarie Klein. (Stanford U.) **Suceptibility to hypnosis and susceptibility to social influence.** *Dissert. Abstr.*, 1961, 22(5), 1735-1736.—Abstract.

3388. Reyher, Joseph, & Shoemaker, Donald. (Michigan State U.) **A comparison between hypnotically induced age regressions and waking stories to TAT cards: A preliminary report.** *J. consult. Psychol.*, 1961, 25(5), 409-413.—A complex method of scoring differences (D) between protocols for TAT cards is devised. Ss were given conflict inducing instruction and regressed to an age when the conflict was difficult to manage. High D scores occur with both conflict and neutral cards, but neutral cards are associated with positive affect. Sample protocols are included "... immediate diagnostic significance ... over-shadowed ... experimental goals."—E. R. Oetting.

3389. Sparks, Laurance. **Self-hypnosis: A conditioned response technique.** New York: Grune & Stratton, 1962. xiii, 255 p. \$5.75.—The description of self-hypnotic procedures within a psychological orientation of conditioning. Little theoretical material is presented regarding hypnosis, per se, with the major portions of the book limited to techniques for self-hypnosis and the measurement of self-hypnotic depth. Applications include time-distortion mechanisms and self-directed treatment for such conditions as obesity, pain anxiety, allergies, sexual disorders, habits, and a variety of other human problems.—M. V. Kline.

3390. Stevenson, D. R., Stoyva, J., & Beach, H. D. (Dalhousie U., Canada) **Retroactive inhibition and hypnosis.** *Bull. Maritime Psychol. Ass.* 1962, 11(1), 11-15.—The hypothesis, from the Theory of Associative Interference, was tested: that if original material is learned in the waking state and interpolated material is learned in the hypnotic state, then retention will be higher than if both materials were learned in the waking state. Results failed to support hypothesis and implications are compared with results of Mitchell and Nagge.—C. W. Page.

3391. Weitzenhoffer, Andre M. (Stanford U.) **The significance of hypnotic depth in therapy.** *Int. J. clin. exp. Hypn.*, 1962, 10(2), 75-78.—It is a common assumption that hypnosis has a quality of degree. While clinicians often state that success is unrelated to depth, the author maintains that depth determines the techniques one can successfully use in hypnotherapy. At the same time he believes that hypnotic behavior is multidimensional and that the major determinant of hypnotherapeutic success is the

therapist's ability to establish a meaningful interpersonal relationship.—C. S. Moss.

DREAMS

3392. Berger, Ralph J., & Oswald, Ian. (U. Edinburgh, Scotland) **Eye movements during active and passive dreams.** *Science*, 1962, 137(Whole No. 3530), 601.—Independent confirmation is offered that the amount of rapid eye movement during dreaming is associated with the dream content.—*Journal abstract.*

3393. Roth, N. (New York) **Dream data on the relation of perception and motility.** *Percept. mot. Skills*, 1962, 14(3), 427-430.—Sensory processes are discussed not as fixed or constant in nature, but undergoing numerous alterations according to the total emotional situation. They are promptly expressed in motor readiness and motor performances which reveal specific vicissitudes in accordance with the underlying sensory events. The relationship between sensation and motility can be observed in detail in dream interpretation.—W. H. Guertin.

3394. Roth, N. (NYC) **Perception in dreams.** *Percept. mot. Skills*, 1962, 14(1), 7-9.—Clinical and theoretical evidence reveals that the perceptual process for all modalities of sensation can be studied by examination of manifest dream content. The method shows the evolution of percepts, whereby they attain either veridical refinement or pathologic distortion.—W. H. Guertin.

CASE HISTORIES

3395. Apfeldorf, M. (VA Cent., Martinsburg, W. Va.) **Perceptual and conceptual processes in a case of left-sided spatial inattention.** *Percept. mot. Skills*, 1962, 14(3), 419-423.—Analysis of the drawings of a commercial artist with left-sided spatial inattention suggested that inattention occurred most frequently in tasks that were complex, and required conceptualization or imagination rather than direct perception. The inattention in the drawing process occurred not only in relation to the major Gestalt or unit but to all the sub-Gestalts of the drawing. It appeared that new subjective midlines occurred even toward the right of the paper and aspects of details on the left of these subjective midlines were omitted.—W. H. Guertin.

3396. Crumpton, E. (VA Hosp., Los Angeles) **Projective case study of a true hermaphrodite.** *J. proj. Tech.*, 1962, 26(3), 266-275.—"Rorschach and TAT protocols are presented in a projective case study of a true hermaphrodite, whose see-saw solutions to the problem of sexual identification led him both to success as a creative professional person and prolonged hospitalization as a paranoid schizophrenic."—A. Greenwald.

3397. Moss, C. Scott; Thompson, Mary Margaret, & Nolte, John. (National Inst. Mental Health) **An additional study in hysteria: The case of Alice M.** *Int. J. clin. exp. Hypn.*, 1962, 10(2), 59-74.—Detailed account of the psychotherapy of one female hysteric—a treatment failure—is the stimulant for discussion of the genetics and dynamics of this nosology. Hypnosis revealed the experimental basis for the symptoms and associated adjustment difficulties. The dynamics bear a remarkable resemblance to those advanced by Freud, though issue is taken with

several psychoanalytic concepts. The discussion deals largely with the phenomenology of the female hysteric.—*Author abstract.*

3398. Schultz, J. H. (Bayernallee 17, Berlin-Charlottenburg, Germany) *Ein psychotherapeutischer Fall bei Johanna Spyri.* [A case of psychotherapy described by Johanna Spyri.] *Prax. Psychother.*, 1962, 7(3), 111-114.—The treatment of homesickness in a book in the Heidi series by J. Spyri is quoted at some length with little comment except that it was written 20 years before Jasper's classical dissertation on the subject.—*W. Swartley.*

3399. Siegal, R. S., Rosen, I. C., & Ehrenreich, G. A. (Menninger Found.) *The natural history of an outcome prediction.* *J. proj. Tech.*, 1962, 26(1), 112-116.—Test data are presented in the case of a 27 year old married nurse, with the process of interpretation and inferences as to underlying personality variables presented. Predictions as to therapeutic outcome are discussed in light of the therapeutic approach and patient's character structure.—*A. R. Greenwald.*

PSYCHIATRIC SERVICES

3400. Kreitman, Norman. (Graylingwell Hosp., Chichester, Sussex, England) *Psychiatric orientation: A study of attitudes among psychiatrists.* *J. ment. Sci.*, 1962, 108(Whole No. 454), 317-328.—The entire medical staffs of Maudsley and Bethlem Royal Hospitals in London who were treating patients as of May 1956 completed attitude scales designed to measure sympathy with psychological and organic approaches to psychiatric problems and Guilford-Martin Inventory and A and R scales of the MMPI (N of 78). Endorsement of the psychological orientation was significantly and positively correlated with Guilford-Martin T, D, and D+C scales, with MMPI A scale, and with ratings of introversion. Sympathy with the organic approach correlated negatively with the T scale. Increasing psychiatric experience was associated with fall in organic scores and rise in psychological attitude scores.—*W. L. Wilkins.*

3401. Pulos, Lee; Nichols, Robert C., Lewinsohn, Peter M., & Koldjeski, Theodore. (LaRue D. Carter Hosp., Indianapolis, Ind.) *Selection of psychiatric aides and prediction of performance through psychological testing and interviews.* *Psychol. Rep.*, 1962, 10(2), 519-520.—Predictive ratings by a chief nurse after one interview and performance on various standard tests of 44 new psychiatric aides were correlated with efficiency ratings by supervisors after 90 days service. Only the chief nurse's ratings and one test subscore were significantly related to criterion. Relationships between the chief nurse's ratings and test scores and the value of the interview as a selection procedure were discussed.—*B. J. House.*

3402. Saslow, G., & Matarazzo, J. (U. Oregon Medical School) *A setting for social learning.* *Ment. Hosp.*, 1962, 13(4), 217-226.—Novel emphases in the operation of the psychiatric service of the University of Oregon Medical School are described as "analogous to those of Skinnerian conditioning."—*L. Gurel.*

3403. Simon, J. Richard, & Olson, Marian E. (U. Iowa) *Assessing job attitudes of nursing*

service personnel. *Nurs. Outlook*, 1960, 8(8), 424-427.—Attitudes of nursing service personnel on an experimental ward (where the nursing staff had been augmented and an inservice education program had been conducted) were compared with attitudes of a control group. The groups did not differ on a mean index of job satisfaction but did differ on certain individual questionnaire items. Nurses ranked "a good chance to do interesting work" and "opportunity to do good patient care" as the most important factors in their jobs.—*J. R. Simon.*

Institutional Care

3404. Ball, A. E., Pile, E., & Hogshead, T. (New Mexico State Hosp., Las Vegas) *A small state hospital: Putting first things first.* *Ment. Hosp.*, 1962, 13(6), 331-333.—Changes in operation of the New Mexico State Hospital in the pre-ataractic years "managed to reduce its patient population by almost 15 per cent." The authors conclude "that a small, dedicated staff under good leadership can work wonders."—*L. Gurel.*

3405. Band, Raymond I., & Brody, Eugene B. (U. Maryland) *Human elements of the therapeutic community: A study of the attitudes of people upon whom patients must be dependent.* *Arch. gen. Psychiat.*, 1962, 6(4), 307-314.—13 mainly 1st-year psychiatric residents, 20 graduate psychiatric nurses, and 44 Negro aides in a university psychiatric hospital were given a 40 multiple-choice questionnaire regarding attitudes towards wards, patients, staff functions, and treatment. 7 residents, 8 nurses, and 8 aides were interviewed concerning 10 patient-staff situations. Results showed that professional attitudes, values, and response tendencies of the 3 groups differ significantly and persist despite intensive efforts at interprofessional communication. "A potential for intrastaff conflict is built into the structure of the psychiatric treatment unit . . . [and] is related to the social and occupational status and role of each staff member." The negative influences intrastaff conflict may have on patient care are discussed. (17 ref.)—*L. W. Brandt.*

3406. Bell, Robert Louis, Jr. (U. Texas) *Factors influencing attitudes toward hospital discharge in neuropsychiatric patients.* *Dissert. Abstr.*, 1961, 22(6), 2067-2068.—*Abstract.*

3407. Bierer, J. (Marlborough Day Hosp., London, England) *The day hospital: Therapy in a guided democracy.* *Ment. Hosp.*, 1962, 13(5), 246-252.—*L. Gurel.*

3408. Bortner, R. W. (VA Cent., Kecoughton, Va.) *Super-ego functioning and institutional adjustment.* *Percept. mot. Skills*, 1962, 14(3), 375-379.—3 groups representing different patterns of adjustment in an institutional environment were compared with each other and with noninstitutional groups. Some of these noninstitutional samples were younger than the institutional groups; 2 samples were older. The hypothesis that these institutionalized groups would differ from noninstitutional samples and among themselves on measures of superego functioning and that these differences in functioning could not be attributable solely to the effects of aging was partially substantiated. Significant differences on 6 of the 8 measures were obtained.—*W. H. Guertin.*

3409. Clark, D. H., Hooper, D. F., & Oram, E. G. (Cambridge U.) Creating a therapeutic community in a psychiatric ward. *Hum. Relat.*, 1962, 15(2), 123-147.—The transformation of a women's ward into an effective therapeutic community is described in detail. Within the social structure of the ward, the roles of both patients and staff were modified considerably by the creation of a permissive and unstructured milieu which permitted patients to become active in organized patterns of interaction. An oscillatory process of growing social disorganization followed by social reorganization and the emergence of focal roles among the patients were prominent elements in the social process of the change. Problems arising from interaction with other administrative units of the hospital are discussed.—*W. W. Meissner*.

3410. Davis, J., Griffith, R., & Bradley, Doris. (VA Hosp., Lexington, Ky.) A morale survey through the depth interview. *Ment. Hosp.*, 1962, 13(4), 212-213.—Depth interviews with a carefully selected representative sample replaced questionnaires in a morale survey of mental hospital employees. In addition to areas specifically under study, it was found that morale was affected by personal factors unrelated to the work setting.—*L. Gurel*.

3411. Fletcher, Mildred E. (126 West Main St., Williamson, N. Y.) Attitudes of a group of nursing students toward a clinical affiliation in a public hospital for the mentally ill. *J. Psychol.*, 1962, 54(1), 47-63.—The purpose of the study was to determine the attitudes of nursing students toward psychiatric nursing and whether the attitudes revealed implications relative to future program planning for students during psychiatric affiliation. The Ss were 35 nursing students from 3 hospital schools of nursing. The technique was an attitude questionnaire of 100 questions relating to selected areas, significant of attitudes toward psychiatric nursing. Results of analysis revealed many unfavorable attitudes toward psychiatric nursing which should be of concern to nurse educators in this field.—*Author abstract*.

3412. Goffman, Erving. (U. California, Berkeley) Asylums: Essays on the social situations of mental patients and other inmates. Garden City, N. Y.: Doubleday (Anchor), 1961. xiv, 386 p. \$1.45 (paper).—First an exposition is given of characteristics which mental hospitals share with other "total institutions" (e.g., jails, military camps, monasteries) and how their inmates adjust in similar ways to them. This process is then described as the "moral career of the mental patient," and the situation is further elaborated by a field study on "the underlife of a public institution: study of ways of making out in a mental hospital." Finally "some notes on the vicissitudes of the tinkering trades" are made in regard to "the medical model and mental hospitalization."—*R. Kaelbling*.

3413. Guépin, Florence. Hospitalisation et immobilisation prolongées chez de jeunes enfants: Leurs conséquences psychologiques. [Prolonged hospitalization and immobilization of young children: Their psychological consequences.] *Enfance*, 1962, No. 2, 127-168.—20 girls and 6 boys having orthopedic conditions were divided into 2 groups of equal size. One group, ages 13 mon.-3 yr., was studied from the beginning of treatment while the other group, ages 17 mon.-4 yr.-1, had already been hospitalized and immobilized over a period of several

months. Tests, drawings, observations, questionnaires, and parent interviews supplied data for within- and between-group comparisons. In spite of recognized limitations of the data, the following conclusions are drawn: (a) undesirable effects upon development are greatest for those children who are deprived of contact with their homes, (b) children whose families are stable and well balanced do not appear to suffer profoundly from hospitalization or immobilization.—*S. S. Marzolf*.

3414. Hooper, D. F. (Tavistock Inst. Human Relations, London, England) Changing the milieu in a psychiatric ward. *Hum. Relat.*, 1962, 15(2), 111-122.—The change of a men's disturbed ward from a rigid, unpleasant, and restraining environment to a much more permissive and stimulating type of administration is described. Physical changes were striking, but social-psychological changes were not so marked. Discrepancy was found between improvement on several behavioral indices and the perception of change reflected in nurses' ratings. The necessity of taking into account the stability and coherence of existing social structures, while introducing innovations, is stressed.—*W. W. Meissner*.

3415. Huet, J.-A. Les problèmes économiques découlant de l'encombrement des hopitaux psychiatriques par les vieillards. [Economic problems following from the overcrowding of psychiatric hospitals for the aged.] *Hyg. ment.*, 1962, 51(1), 5-11.—Economic problems are discussed and the conclusion is drawn that such factors are forcing a complete revision of present concepts of hospital living, the training of personnel, and subsidization of research institutions. A 3-fold solution is suggested: day-hospitals, protective work-groups, and post-cure homes.—*W. W. Meissner*.

3416. Jones, Roy Junius. (American U.) The effects of inter-ethnic group contact in a desegregated hospital community. *Dissert. Abstr.*, 1961, 22(5), 1710.—*Abstract*.

3417. Kuncze, J., & Anderson, W. (VA Hosp., Jefferson Barracks, Mo.) Maze performance and privileges in a psychiatric hospital. *J. clin. Psychol.*, 1960, 16(4), 362-364.—This study attempted to investigate the relationship between Peters' Circular Mazes for measuring of decision-making capacity and the self-management of the patient which was judged in terms of the ward staff's decision to grant or withhold privileges. 117 Ss were included in the first sample of this study and the results were cross-validated against 110 patients who were admitted later into the same hospital, the total sample being 227 cases. The results indicated that at the .001 level maze performance was related to progress in self-management. It was suggested that mazes could be a useful technique for screening patients for early discharge from an institution.—*V. J. Bielewskas*.

3418. Pense, A. W., Patton, R., & Hills, G. (Office Mental Retardation, Albany, N. Y.) The use of sampling techniques to determine the extent of patients' physical care needs in several institutions. *Amer. J. ment. Defic.*, 1962, 67(2), 211-217.—A central mental health agency which operates a number of institutions for the mentally retarded must have some method of staffing these institutions equitably. A method is described for the assignment of ward personnel, by use of an existing punch card system, sampling the population, and selecting those

patients who require special care. The results of the study in terms of the population of the institutions and the total nursing care needs are indicated.—V. S. Sexton.

3419. Roberts, E. L., & Lindsay, J. S. B. The mental hospital: Structure, function, and communication. *Brit. J. med. Psychol.*, 1962, 35(2), 155-164.—Operation of a mental hospital as a therapeutic community involves detailed understanding of structure, communication, and functional problems which are described and discussed.—C. L. Winder.

3420. Schmiedeck, Raoul A. (Hall-Brooke Hosp., Westport, Conn.) A treatment program for adolescents on an adult ward. *Bull. Menninger Clin.*, 1961, 25(5), 241-248.—Major deficiencies in treating adolescents on an adult ward in a mental hospital were noted: insufficient control of aggressive and disruptive behavior, insecurity on the part of the staff and absence of a consistently helpful attitude, development of a tense atmosphere through domination of ward life by teenagers, lack of educational and adjunctive therapy facilities, and lack of staff time to meet patients' need for attention. Desirable results were achieved by shifting authority from the staff to the patients and by creating small groups of patients ("family units"), each consisting of adults and adolescents.—W. A. Varvel.

3421. Simon, J. Richard, & Chastain, Sally S. (U. Iowa) Take a systematic look at your patients. *Nurs. Outlook*, 1960, 8(9), 509-512.—The article suggests that "patient welfare is reflected in the patient's activity pattern." A method for recording the activity of hospitalized patients is described. Authors discuss patient activity sampling as a tool for identifying problems, as a means of evaluating changes, and as an aid in everyday nursing.—J. R. Simon.

3422. Simon, J. Richard. (U. Iowa) Systematic ratings of patient welfare. *Nurs. Outlook*, 1961, 9(7), 432-436.—The article suggests that "patient welfare is the ultimate criterion for evaluating the adequacy of patient care." 4 rating scales are described which measure different dimensions of patient welfare: mental attitude, mobility, physical independence, and skin condition. The author suggests ways in which improved patient care can result from a systematic use of the rating scales.—J. R. Simon.

3423. Sines, L. K., & Silvers, R. J. (U. Minnesota Medical School) MMPI correlates of ward placement among state hospital patients. *J. clin. Psychol.*, 1960, 16(4), 404-406.—In many state hospitals, patients are grouped in wards according to their probable behavior trends, such as: their proneness for escape, anti-social behavior, and other evidences of management difficulties. In this paper the MMPI scores were correlated with the ward placement of the patients at Fergus Falls St. Hospital who were amenable to MMPI testing (total N equal 611). Hathaway codes were used in obtaining the mean profiles, and the results showed high correlation between the ward placement and the MMPI profiles of the patients. Since the MMPI was not used as a criterion for ward selection, the findings were interpreted as indicating that "ward placement of patients has objective psychological correlates." The study also supports the use of the MMPI as a method of ward placement of patients.—V. J. Bielaukas.

3424. Surber, Grace Pennington. (New Hampshire State Hosp.) Predicting improvement of psychiatric patients from early ward socializing ratings. *J. consult. Psychol.*, 1961, 25(5), 461.—Female patients rating high on a scale of socializing behavior achieved 6 hospital privileges significantly earlier.—E. R. Oetting.

3425. Urmer, A. H., Malek, Zena, & Wendland, L. V. (Rancho Los Amigos Hosp., Downey, Calif.) A hospital adjustment scale for chronic disease patients. *J. clin. Psychol.*, 1960, 16(4), 397-398.—In order to insure an objective evaluation of the patient's adjustment a new scale, based on the Ferguson et al. Hospital Adjustment Scale, was constructed. 2 nurses served as raters and used this scale on 42 chronic disease female patients. Later on the scale was reduced from 55 to 25 items, increasing its sensitivity. The reliability of the new scale yielded $r = .94$ for 2 raters. The 25 items are shown in a table.—V. J. Bielaukas.

3426. Vaughn, R. M. (U. Florida, Gainesville) Some limitations of the psychotherapeutic model in the hospital. *Ment. Hosp.*, 1962, 13(7), 378-380.—"... large mental hospitals, in spite of their earlier commitment to moral treatment, the historical forerunner of sociotherapy, are dominated by the psychotherapeutic orientation. Adherence to individual psychotherapy as the primary therapeutic tool may be one of the major obstacles to change in mental hospitals... the change needed in mental hospitals is not improvement in individual patient-care."—L. Gurel.

3427. Zolik, Edwin S., Des Lauriers, Austin, Graybill, John G., & Hollon, Thomas. Fulfilling the needs of "forgotten" families. *Amer. J. Orthopsychiat.*, 1962, 32(1), 176-185.—Group discussion meetings for those who have or have had a family member in a mental hospital can be staffed by trained volunteers. The meetings help relatives understand what goes on at the hospital and what mental illness is. They foster a greater acceptance of ill relatives.—R. E. Perl.

Community Services

3428. Chandler, Caroline A., Bajda, Lenore J., & Fisher, Lisolette K. (National Inst. Health) A pilot study to detect early developmental deviations in children. *Develpm. Med. child Neurol.*, 1962, 4(4), 380-386.—Aimed at "the provision of services in the child health clinics of (a) local (county) health departments for early detection and management of developmental and behavioral abnormalities" in children under 6 years of age and not yet in school, the demonstration project, which involved 43 cases, revealed the merit of a carefully planned referral system (with pre-referral training) but an often-hampering lack of appropriate adjustment facilities (kindergarten, and the like). "The brief period of studies demonstrates the value of providing psychological help for infant welfare clinics."—T. E. Newland.

3429. Cutter, Albert V., & Hallowitz, David. Different approaches to treatment of the child and parents. *Amer. J. Orthopsychiat.*, 1962, 32(1), 152-158.—7 major treatment approaches are used by the Psychiatric Clinic of Buffalo based upon the diagnosis of the parents and of the child: (a) child seen by one therapist and parents together by 2nd thera-

pist; (b) child seen individually and parents in joint interviews by one therapist; (c) mother, father and child seen jointly by one therapist; (d) child seen by one therapist, a parent seen by a 2nd therapist; (e) parents only seen in a parent treatment process with one therapist; (f) child alone seen in treatment; and (g) separate treatment of child, mother, and father involving 3 therapists. Other approaches may be used experimentally or infrequently. The criteria set forth are by no means definite but should be used as frames of reference in selecting most effective treatment approach.—R. E. Perl.

3430. Goolishian, Harold A. Family treatment approaches: II. A brief psychotherapy program for disturbed adolescents. *Amer. J. Orthopsychiat.*, 1962, 32(1), 142-148.—Multiple impact brief psychotherapy is described in which the treatment team of psychiatrist, psychologist, and social worker undertake to work with one family group over a 2 to 3 day period for 6 to 8 hours each day. It is thought that after this treatment the family, with new insights, hopes, and freedom of communication, is now in a better position to begin the task of self-rehabilitation.—R. E. Perl.

3431. Klebanoff, Lewis B., & Bindman, Arthur J. The organization and development of a community mental health program for children: A case study. *Amer. J. Orthopsychiat.*, 1962, 32(1), 119-132.—The development of a community mental health program for children in Massachusetts is described. It is hoped that this discussion of the problems that were encountered in working with individuals in schools and the community at large will assist others in their planning of community mental health services.—R. E. Perl.

3432. Lawrence, Margaret Morgan; Spanier, Irene J., & Dubow, Mildred W. An analysis of the work of the school mental health unit of a community mental health board. *Amer. J. Orthopsychiat.*, 1962, 32(1), 99-108.—A school mental health unit organized in Rockland County as a pilot project has functioned as a consultative body with the goal of assisting school staff in their work of emotional education of all the county's children.—R. E. Perl.

3433. Mullen, Frances A., & Blumenthal, Leroy H. Principles of agency-school cooperation in a program for emotionally disturbed children. *Amer. J. Orthopsychiat.*, 1962, 32(1), 109-118.—A public school education program in a residential treatment center must decide whether it is primarily an adjunct to therapy or an institution of learning. (They feel that it should be an educational institution.) It must have good teachers, a flexibility in a framework of firmness, a structured program, and extracurricular activities for the remainder of the day. The educational program provided by the Chicago public schools for the residential program operated by the Jewish Children's Bureau is described.—R. E. Perl.

3434. Reidy, Joseph J. Family treatment approaches: I. An approach to family-centered treatment in a state institution. *Amer. J. Orthopsychiat.*, 1962, 32(1), 133-142.—A family-centered treatment is described as practiced at the Esther Loring Richards Children Center. Unique are the facts that referring agencies are required to remain active on the case

while the child is in the institution, and parents are required to take care of their child at home each weekend. Treatment is focused on the adjustment of the child in his family. The reasoning is that since the child was accepted not because he was emotionally ill, but because he was emotionally ill to the degree that he could no longer remain in the community, the Center should help the child become well enough to return to the community. Further help would, of course be needed but this the community would provide, case-work, outpatient therapy, etc.—R. E. Perl.

3435. Smith, Emily A., Ricketts, Betty M., & Smith, Sarah H. The recommendations for child placement by a psychiatric clinic. *Amer. J. Orthopsychiat.*, 1962, 32(1), 42-52.—In addition to the usual child guidance clinic study, 4 other areas must be discussed when a child guidance clinic is considering whether placement is indicated: (a) meaning of separation to child and family; (b) causes of the immediate breakdown of family functioning; (c) ability of family to handle trauma other than separation, such as increased feelings of guilt and inadequacy; and (d) use of child's symptoms in the family balance. A family with a child who may be placed requires many services from the clinic including a careful matching of the needs of the family and child with the available treatment and placement facilities. Discussion by Alan O. Ross.—R. E. Perl.

3436. Tisza, Veronica B., Lewis, Melvin, & Green, Morris. Management of the parent in pediatric practice. Workshop, 1960. *Amer. J. Orthopsychiat.*, 1962, 32(1), 53-73.—The management of the parents of the chronically ill child is discussed by Tisza who outlines the shock, the grief, the denial, and the guilt of parents who find they have a permanently damaged child. Parents can arrive at an appropriate adjustment if they can be helped to give up pre-illness goals and fantasies, work through their grief over the loss, and accept altered goals realistically. In discussing the management of parents of acutely ill children in the hospital, Lewis demonstrates that individual interviews, ward group meetings for mothers, and joint meetings between parent, child, and pediatrician, and either social worker, nurse, or child psychiatrist are effective means of dispelling misunderstandings and promoting feelings of mutual trust. Discussing pediatrics and the ambulatory patient, Green emphasizes the team approach.—R. E. Perl.

3437. Umbarger, Carter C., Dalsimer, James S., Morrison, Andrew P., & Breggin, Peter R. College students in a mental hospital. New York: Grune & Stratton, 1962. xix, 168 p. \$5.75.—A report on the development and growth of a student volunteer program (Harvard-Radcliffe) to serve the needs of the mentally ill at the Metropolitan State Hospital, Waltham, Massachusetts. Written by 4 of the students who were leaders in the program during their undergraduate years. This volume stresses the relationships that were developed between patients and these young volunteers. Particular emphasis is placed upon the positive effects the program had upon the therapeutic climate of the patients and on the attitudes of the volunteers toward mental illness.—M. A. Seidenfeld.

3438. Van Dyke, Norma. Discomfort and hope: Their relationship to outcome of referral. *Smith Coll. Stud. soc. Wk.*, 1962, 32(3), 205-219.—After

studying the outcome of cases referred to an agency, it is concluded that "while hope is necessary in seeking help, it does not guaranty the use of it. Conversely, while discomfort did not appear sufficient to enable families to seek help, high discomfort appeared to have greater value as a predictor of follow-through." Follow-through was more strongly associated with continued discomfort than with having positive feelings towards the clinic.—G. Elias.

Case Work

3439. Frailberg, Selma. A therapeutic approach to reactive ego disturbances in children in placement. *Amer. J. Orthopsychiat.*, 1962, 32(1), 18-31.—Case material is presented to illustrate how the transference neurosis and its handling can provide the key to milieu therapy. The caseworker must help and teach the cottage parents to understand transference manifestations, allow for a period of grief or withdrawal, and handle reactions to placement. In the discussion, Catherine Berwald stresses the importance of understanding and handling problems of separation but suggests that we may be expecting performance beyond the real ability of caseworkers.—R. E. Perl.

3440. Plotnick, Harold Leslie. (Columbia U.) The relation between selected personality characteristics of social work students and accuracy in predicting the behavior of clients. *Dissert. Abstr.*, 1961, 22(4), 1259.—Abstract.

COUNSELING & GUIDANCE

3441. Creaser, William B. Enthusiasm: Prescription for successful epileptic counseling. *J. Rehabil.*, 1962, 28(3), 15-16.—A brief discussion of the contribution that can be made by an interested, emphatic, and enthusiastic counselor working with epileptic clients.—M. A. Seidenfeld.

3442. Fahs, Harold Jay. (Michigan State U.) Relationship of certain factors to successful case closure in a child guidance clinic. *Dissert. Abstr.*, 1961, 22(6), 2069-2070.—Abstract.

3443. Ford, Donald H. (Pennsylvania State U.) Group and individual counseling in modifying behavior. *Personnel Guid. J.*, 1962, 40(9), 770-773.—"The task of counseling is behavior change. A way of conceptualizing behavior and clear specification of the behaviors to be changed are essential in making decisions about the most effective procedures for producing the change."—S. Kavruck.

3444. Godin, A. De overdracht en haar oplossing in de pastorale relatie. [Transmission and its solution in pastoral relations.] *Gawein*, 1962, 10(5), 275-291.—There is no denying that some pastoral relations (spiritual guidance, moral or religious consultations) are hindered by the influence of an affectivity, the true nature of which often remains subconscious. Several sorts of evolution of this relation based on transmission are described and a practical line of conduct is sketched for the priest who is aware of this obstacle. The important difference between psychotherapeutical and pastoral use of this transmission is outlined and illustrated with 3 concrete examples.—J. A. Lücker.

3445. Lesser, William M. (State Hosp. Middletown, Conn.) The relationship between counseling

progress and empathic understanding. *J. counsel. Psychol.*, 1961, 8(4), 330-336.—Scales for Empathic Understanding and Feeling of Similarity for counselor of client were developed. Counseling progress was measured by increased correlation in self, ideal-self, Q sort. Empathy is unrelated to counseling progress. Correct awareness of similarity by counselor was related to progress.—E. R. Oetting.

3446. Deton, Donald A., & Walter, Sidney. (U. California, Los Angeles) (System Development Corp.) A factor analysis of the California Psychological Inventory and Minnesota Counseling Inventory. *Calif. J. educ. Res.*, 1962, 13(3), 126-133.—150 male and 114 female 9th graders were administered the 2 devices (order of administration not specified). Results on the 18 CPI scales and on the 9 MCI scales were analyzed. "Five factors were identified which appear relevant to counseling inventories," tentatively identified as Mental Health and Personal Efficiency, Social Confidence and Drive, and Need for Good Impression.—T. E. Newland.

3447. Missildine, W. Hugh. (Ohio State U.) The "mutual respect" approach to child guidance. *Amer. J. Dis. Children*, 1962, 104(2), 116-121.—The rationale, that family members should respect each other's unique behavior, is presented as the basis for suggestions given parents on handling typical child guidance problems. The treatment method is very short-term. Results on 97 children are "encouraging."—A. B. Warren.

3448. Patterson, C. H. (U. Illinois) A note on the construct validity of the concept of empathy. *Personnel Guid. J.*, 1962, 40(9), 803-806.—7 variables related to the concept of empathy were studied in a group of rehabilitation counselor trainees. Some evidence of construct validity was suggested. The Kerr-Speroff Test of Empathy did not correlate to any degree with the other variables. (21-item bibliogr.)—S. Kavruck.

3449. Ross, Alan O., & Lacey, Harvey M. (Pittsburgh Child Guidance Cent.) Characteristics of terminators and remainders in child guidance treatment. *J. consult. Psychol.*, 1961, 25(5), 420-424.—Families who remained in child guidance treatment had more developmental difficulty, unusual behavior, marital disharmony, and semantic disorders, than parents in concurrent treatment. Terminators had more truancy and were less likely to have a long wait before treatment. Generally, parents motivation and involvement seemed critical.—E. R. Oetting.

3450. Wall, Harvey W. (Pennsylvania State U.) A counseling program for parents of college freshmen. *Personnel Guid. J.*, 1962, 40(9), 774-778.—Parental influences are believed to play a major role in students' early formulation and development of educational and career plans. A counseling program for parents is described. Parents developed more realistic attitudes towards standards of academic achievement, more accurately appraised career interests, and expressed favorable attitudes towards the value of counseling.—S. Kavruck.

MARRIAGE & FAMILY PROBLEMS

3451. Canziani, Willy. (Hörnallee 69, Riehen/Basel, Switzerland) Zur Funktionspsychologie der Ehekonflikte. [On the functional psychology of

marital conflicts.] *Heilpadag. Werkbl.*, 1962, 31(2), 70-80.—The use of Lüscher's "structural functional psychology" model was found to contribute a great deal to the understanding of marital conflicts. The relationships and major conflicts of 200 couples in a marital counseling clinic were analysed and represented in terms of the 3-dimensional structural model. The investigator felt that this type of theoretical representation made possible prediction of both past and future courses of conflicts. He also was able to analyze the most typical behavioral and motivational patterns producing conflicts, and to delineate differences between husbands and wives in these patterns. Most frequent in the men were: artificial aggression and demands for sympathy, self-admiration, and need for contacts and self-assertion without responsibility or ties. The women's most frequent conflict-producing characteristics included: feeling sorry for themselves; wanting to be spoiled; critical, defensive assertion against expected treatment as an inferior.—D. F. Mindlin.

3452. Charny, Israel W. (Oakbourne Hosp., West Chester, Pennsylvania) Family interviews in redefining a "sick" child's role in the family problem. *Psychol. Rep.*, 1962, 10(2), 577-578.—A presentation of the view that "family therapy facilitates a redefinition of the "sick" child's difficulties as symptomatic of a family problem."—B. J. House.

3453. Coombs, Robert H. (Washington State U.) Reinforcement of values in the parental home as a factor in mate selection. *Marriage fam. Liv.*, 1962, 24(2), 155-157.—Questionnaires completed by 121 systematically selected married couples at the University of Utah indicated that these marriages were socially, racially, and socioeconomically homogeneous. Results supported the view that forces within the parental home exerted an influence toward homogeneity.—L. Shatin.

3454. Hurvitz, N. (4070 Buckingham Rd., Los Angeles, Calif.) The marital roles inventory and the measurement of marital adjustment. *J. clin. Psychol.*, 1960, 16(4), 377-380.—104 middle class couples were interviewed in their homes and the Marital Roles Inventory and the Index of Strain, both instruments devised for this study, were administered to them. The Inventory is based upon role theory and the assumption that spouses whose rank order of role performances and role expectations are similar are adjusted in marriage while spouses whose rank order of role performances and role expectations are different are not adjusted in marriage. The difference between the rank orders of a pair of spouses assigned to a role-set is the Index of Strain. Wives showed significantly lower Indices of Strain than husbands, and "significant inverse associations were found between husbands' Indices of Strain and the marital adjustment scores of the husbands and wives." Suggestions were made for modification of the MRI.—V. J. Bieliaskas.

3455. Kotlar, Sally Lee. (U. Southern California) Middle-class marital roles: Ideal and perceived in relation to adjustment in marriage. *Dissert. Abstr.*, 1961, 22(5), 1734.—Abstract.

3456. Kreitman, Norman. (Graylingwell Hosp., Chichester, Sussex, England) Mental disorder in married couples. *J. ment. Sci.*, 1962, 108(Whole

No. 455) 438-446.—New admissions from 1958 to 1960 included 25 couples of whom 21 could be studied. In 9 instances relationship of a reactive pattern was noted, while in 5 there was a mutual interaction; 1 was response to a common environmental stress. There is a tendency for people of like constitution to marry each other. Psychiatric treatment is facilitated for the 2nd spouse if the 1st to become ill is already in contact with psychiatric services.—W. L. Wilkins.

3457. Lantz, Herman R., & Snyder, Eloise C. (Southern Illinois U.) *Marriage: An examination of the man-woman relationship*. New York: Wiley, 1962. xii, 417 p. \$6.50.—"Deals with the man-woman relationship as it is found in dating, courtship, marriage, and family life among the middle class in contemporary America."—C. H. Miley.

3458. Mace, David R. Some reflections on the American family. *Marriage fam. Liv.*, 1962, 24(2), 109-112.—5 "concerns" and reflections about the American family were voiced by the President of the National Council on Family Relations: child rearing, sex education, dating patterns, marital adjustment, and divorce procedure.—L. Shatin.

3459. Ormont, Louis R. (Teachers Coll., Columbia U.) The use of group psychotherapy in the training of marriage counselors and family life educators. *Marriage fam. Liv.*, 1962, 24(2), 144-150.—The methods were described for an 80-hour course of "preventative psychotherapy" for the novice counselors.—L. Shatin.

3460. Sánchez-Hidalgo, Efraín. (U. Puerto Rico) Desorganización o reorganización del hogar? [Disorganization or reorganization of the home?] *Pedagogia, Rio Piedras*, 1960, 8(2), 7-17.—This presentation before the 1960 Convention of the Puerto Rican Institute of Family Relations is divided into the following sections: introduction; brief review of current literature; changes in authority; economic, political, and intellectual equality of women; the sharing of functions and responsibilities in the Puerto Rican home; undergoing changes in regard to discipline; the decrease of social isolation; and the achievements of public agencies in the orientation of family life.—Author abstract.

3461. Sherman, Sanford N. Family treatment approaches: III. Discussion. *Amer. J. Orthopsychiat.*, 1962, 32(1), 148-151.—Many clinical investigators are exploring concepts which place the individual in a continuum of interactional relationships within the family and the community. Goolishian reports treatment that is based on a brief but massive intervention in the role adaptational pattern of the family. But even here much of the work devolved into individual interviewing. Reidy's description of work with children in a state hospital, where an attempt was made to preserve family identity by the family taking week-end responsibility for the child and the community agency remaining active with the family while the child was hospitalized, contributes to the development of family-focused treatment procedures. Much more work is needed on "middle level" concepts which forge the link between theory and practice.—R. E. Perl.

3462. Stokes, Walter R. (Washington, D. C.) *Married love in today's world*. New York: Citadel, 1962. 160 p. \$3.95.—Written by a psychiatrist who

has specialized in marriage counseling, and to be used as a premarital guide as well as a manual for married couples. Particular emphasis is given to the physiology and psychology of sexual adjustment. Other major topics include: Personality Qualifications for Marriage, Problems of Early and Later Marriage, Children and Family Relations, and Future Trends in Marriage. (Appendices, glossary, 4 illustrations, index)—*D. G. Brown.*

3463. Tyler, Edward A., Truunmaa, Aare, & Henshaw, Patricia. (Riley Child Guidance Clinic, Indianapolis, Ind.) Family group intake by a child guidance team. *Arch. gen. Psychiat.*, 1962, 6(3), 214-218.—Based on experience with 100 cases it was found that a 15-min. to 1-hour intake interview of the whole family by a team consisting of a psychiatrist, a psychologist, and a social worker improves the feeling of responsibility of the clinician for the entire family, the objectivity of the therapist treating one of the family members later on, the establishing of confidence towards the treatment in the child and his parents, the open discussion of the psychodynamics of the family, cooperation among the therapists during later treatment, and the learning possibilities for trainees.—*L. W. Brandt.*

3464. Walter, James. (Florida State U.) A review of family research in 1959, 1960, and 1961. *Marriage fam. Liv.*, 1962, 24(2), 158-178.—An extensive list was compiled of family research publications during 1959-1961 in 29 different journals. These references were reported according to the following classification: I. Commentaries, Reviews, and Bibliographies; II. Sexual Behavior; III. Premarriage; IV. Marriage and Divorce; V. The Family; VI. Disorganization; VII. Counseling, Education, and Welfare; and VIII. The Family in Other Cultures.—*L. Shatin.*

MENTAL HEALTH & REHABILITATION

3465. Alberti, G. Teoria e prassi di una nuova disciplina: l'Ecologia umana. [Theory and practice of a new discipline: Human ecology.] *Difesa. soc.*, 1962, 41(1), 12-24.—The study of healthy and sick persons in relation to their environment can offer a significant contribution to clinical, social, and preventive medicine.—*L. L'Abate.*

3466. Anderson, Wayne, & Kuncze, Joseph. (VA Hosp., Perry Point, Md.) Stresses of discharge for the mental patient. *J. Rehabil.*, 1962, 28(3), 21-22.—An important factor in creating stress in making the transition from hospital to community by the mental patient appears to be the prolonged stay in an overly protective environment causing the patient to have greatly diminished or even loss of his skills in meeting the demands of normal community life. Through the use of a wide variety of techniques such as counseling, increased responsibility in the institutional environment, and by out-of-ward, foster-home, half-way houses, and trainee-employee work programs the patient is better prepared for these stresses before he is returned to full community life. It is pointed out that supportive and/or counseling services are also needed for those in primary relationships with the patient before he returns to the community so that less stress may be created that will react against the maintenance of mental health of the

patient when he returns home or enters a new environment.—*M. A. Seidenfeld.*

3467. Bierer, J. (Marlborough Day Hosp., London, England) Great Britain's therapeutic social clubs. *Ment. Hosp.*, 1962, 13(4), 203-207.—Although little known in the United States, 100 therapeutic social clubs have developed in England since their inception in 1938. Clubs exist for both inpatients and outpatients. Run by an elected committee of patients, they are said to be particularly useful in helping chronics to remain in the community.—*L. Gurel.*

3468. David, Henry P. (State Office Bldg., Trenton, N. J.) Notes on South Africa and the Congo: Psychology and mental health. *Welf. Reporter, Trenton*, 1962, 13, 148-157.—Based on 1961 observations, summary comments are presented on problems of psychological research in Africa; mental health facilities for children and adults in South Africa, psychiatric and clinical psychological training, and professional practice; the work of the World Health Organization in the Congo; and trends in developing mental health problems in the emerging countries of Africa South of the Sahara.—*C. M. Franks.*

3470. Mead, Margaret. Mental health and the wider world. *Amer. J. Orthopsychiat.*, 1962, 32(1), 1-4.—Comparing the focus of the World Federation for Mental Health in 1948 and 1961 indicates that we now recognize much more fully "that the acute problems of individual identity cannot be separated from the problems of the wider identities of community and nation."—*R. E. Perl.*

3471. Tramer, M. Eine exzeptionelle pädopsychiatrische Expertise. [An unusual case of expert psychiatric opinion.] *Acta paedopsychiat.*, Basel, 1962, 29(5), 152-155.—According to expert opinion, the construction of a cemetery near a children's sanatorium would have noxious psychological effects due to the frequent encounter with funeral processions and interments.—*G. Rubin-Rabson.*

3472. Tramer, M. Zur Rolle von Anpassung und Reziprokanpassung in der Psychohygiene der Entwicklung. [The role of adaptation and reciprocal adaptation in mental hygiene.] *Acta paedopsychiat.*, Basel, 1962, 29(3), 77-82.—Adaptation is seen as a partnership, in which one becomes formed to the other for an intended purpose or at least not in opposition to it. This occurs during every phase of biological development. However, reciprocal adaptation, major or minor, also takes place. Both are necessary for mental hygiene, the former predominating.—*G. Rubin-Rabson.*

3473. World Health Organization, Expert Committee on Mental Health. Programme development in the mental health field. *WHO tech. Rep. Ser.*, 1961, No. 223. 55 p.—"The tenth report of the WHO Expert Committee on Mental Health is devoted to a review of present mental health facilities and resources and to the establishment of priorities for a mental health programme on a world-wide scale."—*J. C. Franklin.*

ABNORMAL PSYCHOLOGY

3474. Daumezon, G., Lanteroi-Laura, G. *Signification d'une sémiologie phénoménologique.* [The meaning of a phenomenological symptomatology.] *Encephale*, 1961, 50(5), 478-511.—Phenomenology should not be conceived as a psychiatric theory but, if it has any significance to psychiatry, it is as an attempt to deepen and renew the clinical bases of psychiatry. It is not even a method, but more of an attitude—an attitude of complete openness to descriptive experience, and to the formulation of problems as problems of meaning. Symptomatology cannot be complete as long as it limits itself to physiological indications. The art is to discern that which characterizes each fundamental type of illness and that which derives from the illness itself rather than from the methodological preoccupations of the psychiatrist. Examples from the works of Binswanger and Minikowski are discussed.—W. W. Meissner.

3475. Kenyon, F. E. (Maudsley Hosp., London, England) *Emergencies in child psychiatry.* *J. ment. Sci.*, 1962, 108(Whole No. 455), 419-426.—Childhood equivalents of the severe depression and the suicidal or homicidal risk were sought, as these are infrequently found in children. For 43 emergency admissions for a 2 year period, fits of depression were found in 16% and suicidal threat in 11.6%. Difficulty in school typified 44%. More careful study of what really constitutes an emergency in child psychiatry is needed.—W. L. Wilkins.

3476. Lowe, Carrington Marshall. (Ohio State U.) *A study of the nature of guilt in psychopathology.* *Dissert. Abstr.*, 1961, 22(3), 909.—*Abstract.*

3477. Morozov, G. V., & Romasenko, V. A. *Nevropatologiya i psikhiatriya.* [Neuropathology and psychiatry.] (Rev. ed.) Moscow, USSR: Medgiz, 1962. 263 p.—This textbook, intended for nurses and other "secondary medical personnel," presents the "principles of Soviet psychiatry and neuropathology."—I. D. London.

3478. Rushworth, Geoffrey. (Churchill Hosp., Oxford, England) *Observations on blink reflexes.* *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(2), 93-108.—Blink reflexes to a bright flash of light, loud click, electrical stimulation of the supraorbital nerve, corneal stimulation, and glabella tap were studied in normal Ss and patients with Bell's palsy, optic atrophy and hemianopia, lesions of the 5th and 8th nerve, paralysis agitans, hemiparesis, tetanus, and a decerebrate child. Depending on the stimulus, several components with different latencies and of different origins can be distinguished. (20 fig., 34-item bibliogr.)—M. L. Simmel.

3479. Tolland, G. A. *Les troubles de l'orientation temporelle dans le syndrome amnésique.* [Difficulties of temporal orientation in amnesia.] *Encephale*, 1961, 50(5), 450-470.—Van der Horst's theory of amnesia derives the symptoms from a disorganization of the apprehension of the passage of time and an incapacity to connect temporal signs to experiences. Experimental and clinical evidence from chronic Korsakoff patients does not support hypotheses derived from the theory. An alternate theory is proposed, according to which the amnesic symptoms reflect a more general deficiency in the encounter between organism and milieu. Disturbances in the tem-

poral system of mnemonic organization are only a part of a large group of disturbances resulting from the basic deficiency.—W. W. Meissner.

PHYSICAL HANDICAPS

3480. Kaufmann, Marie-Theres. (Pro Infirmis, Webergasse 5, St. Gallen, Switzerland) *Seelische Nöte der Behinderten und Gebrechlichen.* [Emotional suffering of the handicapped and the infirm.] *Heilpädagog. Werkbl.*, 1962, 31(2), 50-57.—Emotional difficulties of the handicapped may be traced to 3 problem areas: dependency, social exclusion, and idleness. Dependency in adults can usually be only ameliorated through understanding help. In handicapped children, however, there should be deliberate training toward maximum self-reliance. In order to avoid or minimize social exclusion, the right type of attitude on the part of the other family members is essential. Special schools for handicapped children often facilitate later ease in entering into normal social activities. Deviation from the "normal" population, whether apparent or real, must be studied for each individual case in order to deal with it adequately. Idleness not only deprives the person of economic support and independence, it undermines his sense of purpose, personal satisfactions gained from leading a useful existence, and the feeling of being valued by others.—D. F. Mindlin.

3481. Rusalem, Herbert. *An experiment in the use of correspondence instruction with severely disabled adults.* *Cerebral Palsy Rev.*, 1962, 23(5), 17-18, 20.—15 individuals undertook correspondence study under the supervision of the (New York) Federation of the Handicapped. The federation provided facilities for group study, consultation and guidance, and secretarial assistance. Not only was readiness for education per se a major factor, but the needs of the individuals for the attending (but soon dominating) socialization became a major focus of concern. The importance of a clear delineation between the 2 kinds of needs is stressed.—T. E. Newland.

3482. Smithells, R. W. (U. Liverpool) *The Liverpool congenital abnormalities registry.* *Dev. Med. child Neurol.*, 1962, 4(3), 320-324.—"A description is given of the inception and formation of the Registry. From January 1, 1960, this has recorded all malformations in live and stillborn babies born in the city of Liverpool and the adjoining County Borough of Bootle."—T. E. Newland.

Blindness

3483. Illyés, Sándor, & Szakács, Ferenc. (Hungarian Acad. Science) *A csoportosulás tényezői vak gyermekek közösségében.* [Factors of group formation in a community of blind children.] *Psichol. Tanulmányok*, 1958, 1, 165-173.—Through interrogation and nonparticipant observation the following primary factors were found to be involved in group formation of blind children: (a) sex, (b) level of mental development, (c) degree of vision, (d) physical togetherness (sitting on the same bench, etc.). It was also found that the children select as an ideal "a child whose way of life and thought conforms to the peculiar world of the blind."—(Russian & English summaries)—E. Friedman.

3484. Schwartz, Ralph J., & Steer, M. D. (U. Wichita) *Vocal responses to delayed auditory*

feedback in congenitally blind adults. *J. speech hear. Res.*, 1962, 5(3), 228-236.—7 young blind adults and 10 with normal vision, all normal speakers, heard one story and read another then retold the stories impromptu under synchronous feedback and 3 conditions of delay, .14, .18, and .22 secs. Blind individuals show a reduced phonation time ratio under all conditions, and tend to have lower indices of major sound pressure level (SPL) shifts for synchronous feedback, but both groups show a reduction in this index under delay. No appreciable differences were found for mean SPL, standard deviation of mean SPL, acceptable listening levels, carryover effects, or modality of presentation of stimulus material.—M. F. Palmer.

Deafness

3485. Berg, Frederick Sven. (Southern Illinois U.) **Serial learning: An approach to a rationale for auditory training.** *Dissert. Abstr.*, 1961, 22(3), 922.—Abstract.

3486. Briggs, Beverly M., & Davis, George D. (Hearing & Speech Cent., Columbus, O.) **Rationale for the early training of deaf children.** *J. Rehabil.*, 1962, 28(3), 12-14.—The values to be derived from the early training of the deaf child and his parents are discussed. An early introduction of the parent to the nature of the handicap of his child leads to prevention of faulty habit patterns. The child is encouraged to develop lip-reading and speech at the same age when nondeaf children are beginning to speak. Thus opportunity is provided to use the impetus for spontaneous vocalization and he thus acquires more normal speech characteristics. The importance of auditory training and the early use of hearing aids is stressed as a basis for further improving the chances of his attaining more normal progress in school and later development.—M. A. Seidenfeld.

3487. Hanley, Clair N., & Gaddie, Barbara G. (U. Washington) **The use of single frequency audiometry in the screening of school children.** *J. speech hear. Disord.*, 1962, 27(3), 258-264.—A group of 228 2nd and 4th graders was used to investigate the use of 4000 cps frequency as an audiometric screening test at 15 db. Immediately following, each child was given an individual pure tone threshold test in a sound-treated room. The single frequency test correctly classified 90% of the hard-of-hearing ears and overselected 2.8% of the normal ears.—M. F. Palmer.

3488. Kodman, Frank, Jr.; Waters, Jerry E., & Whipple, Clifford I. (U. Kentucky) **Psychometric appraisal of deaf children using the Columbia Mental Maturity Scale.** *J. speech hear. Disord.*, 1962, 27(3), 275-279.—207 deaf children were administered 1 or more of the following tests: the Revised Beta, the Columbia Mental Maturity Scale and the nonverbal Otis Alpha, Form B. Intercorrelations were positive and moderate in magnitude but were considered to be less than desirable. Obtained IQ's ranged from 40-135 with a mean of approximately 88.0. The CMMS can be used as a screening device with deaf children who appear to be functioning at a mental age of 6 or above, but other instruments should also be considered in the test battery.—M. F. Palmer.

3489. Martsinovskaya, E. N. (Inst. Defectology, APN RSFSR, Moscow) **Vzaimodeistvie artikulatsionnykh i pal'tsevyykh kinesteziy u glukhikh detei.** [Interaction of articulatory and dactyl kinesis in deaf children.] *Vop. Psikh.*, 1962, No. 1, 101-112.—The occurrence of innervation to the finger and lip muscles was measured by an electrophysiological technique. The investigation was aimed at determining the intercorrelations between the 2 muscle areas. When deaf Ss were asked to repeat their family name, muscle potentials were recorded in both the fingers and lips. However, depending on the nature of the task given a S (e.g., listing the months of the year) potentials in the finger muscles might be absent. Occasionally potentials in the fingers were present and those in the lips sharply reduced. Deaf children instructed to inhibit finger or lip kinesis while performing some mental task were only partially successful. Voluntary inhibition was more successful in the case of finger innervation, than in the case of lip innervation. The dominance of the articulatory system as opposed to the finger system was indexed by the latency of muscle potential. With hearing people who had learned the dactyl language of the deaf, the articulatory system dominated. With the deaf children the articulatory system dominated in about 50% of the cases. Finally there was little change with age in the frequency of occurrence of lip and finger muscle potentials.—H. Pick.

3490. Michal-Smith, Harold. (New York Medical Coll.) **Sensory deprivation: A new approach to emotional problems of the child with a hearing loss.** *J. speech hear. Disord.*, 1962, 27(3), 290-294.—New experiments in sensory deprivation present a new psychology for studying and comprehending the deaf and others who suffer from such isolation.—M. F. Palmer.

3491. Oléron, Pierre. (Faculté Lettres & Sciences Humaines, Paris, France) **Le développement des réponses a la relation identité-dissémbance: Ses rapports avec le langage.** [The development of responses of the identity-dissimilarity relation with reference to language.] *Psychol. Franc.*, 1962, 7(1), 4-16.—38 deaf and 38 normal children aged 4 to 7 years and of average intelligence were presented with pairs of stimulus-discrimination objects, some of them identical and some different with respect to shape, object, color, weight, size, or speed. Correct responses were rewarded with candy. The normals were questioned regarding the principles used in the discriminations. The results showed success in both groups from age 5 up with the deaf children only slightly inferior to the normals. This discrepancy was somewhat greater in some series. Verbal expression of the principles involved improved with age.—C. J. Adkins.

3492. Palate, E. L. (Alberta School Deaf) **The measurement of sentence structure of deaf children.** *Alberta J. educ. Res.*, 1962, 8(1), 39-44.—"Scrambled Sentences are better predictors of the language achievement of the deaf than the California Mechanics of English and Grammar subtest." This conclusion is based on a study of 50 students at the Alberta School for the Deaf. The 2 criteria of language achievement were a subjective criterion (total impression on 5 teachers of 50 sequential words of each student's composition) and an objective criterion (number and variety of clauses and participial

and infinitive constructions in student's compositions). Correlations between language achievement criteria and the Raven Progressive Matrices (1938) were .44 and .38, respectively.—G. M. Della-Piana.

3493. Schuknecht, H. F. (Massachusetts Eye and Ear Infirmary, Boston) **Stapedectomy operation for hearing loss from otosclerosis.** *Sound*, 1962, 1(4), 16-21.—The disease of otosclerosis is reviewed and various types of middle ear surgery described. Emphasis is on recently developed surgical procedures such as removal of the stapes and the substitution of a prosthesis.—A. M. Small, Jr.

3494. Thompson, Gary, & Hoel, Richard. (Houston Speech & Hearing Clinic) **"Flat" sensorineural hearing loss and PB scores.** *J. speech hear. Disord.*, 1962, 27(3), 284-285.—Adults seen at the Houston Speech and Hearing Center over a 3-year period with "flat" sensorineural hearing loss in at least 1 ear are reported. There are no significant speech discrimination impairments accompanying the mild losses.—M. F. Palmer.

3495. Tiffany, Ronald, & Kates, Solis L. (Hartford VA Mental Hygiene Clinic) **Concept attainment and lipreading ability among deaf adolescents.** *J. speech hear. Disord.*, 1962, 27(3), 265-274.—On the basis of their scores on 2 lipreading tests, 12 students were assigned to a "good" lipreading group and 12 to a "poor" lipreading group, matched on sex, degree of deafness, intelligence, length of schooling, socio-economic background, and age. They were then required to solve conceptualization problems. Poor lipreaders required more card choices, more time, and tended to make more redundant choices before obtaining correct concepts.—M. F. Palmer.

SPEECH DEFECTS

3496. Arnold, Godfrey E. (New York Eye & Ear Infirmary) **Vocal nodules and polyps: Laryngeal tissue reaction to habitual hyperkinetic dysphonia.** *J. speech hear. Disord.*, 1962, 27(3), 205-217.—Vocal nodules are benign growths at the medial margin of both vocal cords. Polyps represent a more advanced stage. The nodules have a seat of predilection at the junction of the anterior and middle third of the entire cord length. They always result from faulty or excessive vocal function and are secondary organic signs of primary psycho-somatic or socio-economic disorders. Vocal nodules represent a local tissue reaction to the mental strain imposed by inappropriate emotional adjustment to the demands made by society.—M. F. Palmer.

3497. Canfield, William. (Columbia U.) **Dysphonia associated with unilateral vocal cord paralysis: A case study.** *J. speech hear. Disord.*, 1962, 27(3), 280-284.—A report of the voice and speech characteristics of dysphonia associated with vocal cord paralysis in the case of a 59-year-old woman who had had 2 throat surgeries resulting in paralysis of the right vocal fold. Her voice was weak, hoarse, and low pitched. Fullest phonation occurred on post-vocalic nasal sounds. She made herself understood primarily by trying to use an over-precise sharp articulation. Use of control of exhalation in tone support, ear training, and other devices resulted in her regaining the use of her voice to a remarkable degree.—M. F. Palmer.

3498. Dickson, Stanley. (State University Coll., Buffalo) **Differences between children who spontaneously outgrow and children who retain functional articulation errors.** *J. speech hear. Res.*, 1962, 5(3), 263-271.—60 children, 30 of whom had had functional articulatory disorders but had spontaneously outgrown them were compared to 30 who had had functional articulatory disorders and had retained some of them. Children who retain speech errors are inferior in gross motor tasks to those who outgrow them. Speech sound discrimination ability did not differentiate the 2 groups. Mothers of children who retain speech errors tend toward "emotional immaturity and instability" more than do mothers of children who outgrow such errors.—M. F. Palmer.

3499. Flosdorf, P. (Würzburg, Germany) **Über das Stottern.** [On stuttering.] *Jb. Psychol Psychother. med Anthropol.*, 1960, 7(1-2), 126-174.—This article represents an extensive psychological study of stuttering in children and adolescents. The author describes various theories concerning stuttering, discusses the developmental aspects of stuttering, evaluates the sexual differences in stuttering, and presents some sociological implications concerning this behavior. The study of 131 Ss afflicted with stuttering shows that 67% of them began to stutter at the age of 3-4, 30% 6-7, and 3% 9-12 years of age. Following up these statistics an attempt is made to correlate stuttering with various concepts of depth psychology. Suggestions were made for treatment of stuttering also. (87 ref.)—V. J. Bieliauskas.

3500. Freeman, Gerald G., & Lukens, Jean. (Oakland County Board Education, Pontiac, Mich.) **A speech and language program for educable mentally handicapped children.** *J. speech hear. Disord.*, 1962, 27(3), 285-287.—A description of the speech and language program for educable mentally handicapped children in the Oakland County, Michigan, schools. The speech correctionists must examine each case and treat specifically the speech or language deficiencies not attributable to depressed intellectual function.—M. F. Palmer.

3501. Gardner, Warren H., Hill, Sandra D., & Carano, Hilda N. (Cleveland Clinic Found.) **Esophageal speech for a twelve-year-old boy: A case report.** *J. speech hear. Disord.*, 1962, 27(3), 227-231.—A 12-year-old boy was laryngectomized by a shotgun blast. Between sessions of plastic and dental surgery, speech therapists and rehabilitation consultants, using the injection technique, worked with the visiting teacher to help the patient develop tongue and lip mobility. Spontaneous esophageal speech was brought about even before the boy had heard esophageal speech from another person. Less than 1 year later he demonstrated excellent conversational ability and a full octave pitch range.—M. F. Palmer.

3502. Grewel, F. **Taalgebruikstoornissen.** [Disturbances in use of language.] *Garwein*, 1962, 10(4), 204-216.—Different sorts of aphasia and agaphia present much more complicated symptoms than the mere disturbance of formal linguistic structures. Numerous interesting cases, e.g., palilalia and echolalia are found in pathology while many psychoses characterized by strong pathological language-symptoms and simultaneously occurring disturbances in the semiotic systems are being studied.—J. A. Lückner.

3503. Kurshev, V. A. (Chair of Nervous Diseases, Volgograd Medical Inst., USSR) *O vneshnem tormozhenii i rastormazhivanii vo vzaimodeistvii signal'nykh sistem u zaikailushchikhsia.* [External inhibition and disinhibition in the interaction of signaling systems of stutterers.] *Zh. vyssh. nervn. deiatel.*, 1961, 11(6), 985-990.—16 stutterers (age 15-39; 10 males and 6 females) were instructed to react with verbal and motor responses to drawings and to written and pronounced words. Using the Ivanov-Smolenskii method a series of conditioned responses, differential responses, inhibitory and disinhibitory responses was formed. Some differences were found between severe and mild stutterers. In both groups, the disinhibition was stronger than the inhibition. In severe stutterers there is a predominance of inhibitory and disinhibitory responses with words difficult to pronounce acting as stronger stimuli. In the milder group a summation effect takes place in the sense of an influence exerted by the verbal reaction upon the motor response.—A. Cuk.
3504. Lane, H. L., & Moore, D. J. (U. Michigan) *Reconditioning a consonant discrimination in an aphasic: An experimental case history.* *J. speech hear. Disord.*, 1962, 27(3), 232-243.—A technique for the synthesis of speech was employed to investigate the acquisition of a consonant discrimination by an aphasic S. A change in 10-20 msec. in the relative onset times of the 1st and 2nd formants is sufficient in normals to shift the frequency labelling responses from 75% /do/ to 75% /to/. With the aphasic S there was only a very slight tendency for this to occur. The 2 stimuli from the extremes of the continuum were used to condition a discrimination. A dramatic change in the discriminative responses was then observed.—M. F. Palmer.
3505. Morris, Hughlett L., & Smith, Jeanne K. (U. Iowa) *A multiple approach for evaluating velopharyngeal competency.* *J. speech hear. Disord.*, 1962, 27(3), 218-226.—Velopharyngeal closures are multidimensional in character. Assessing a speaker's performance in nonspeech activities such as oral breath pressures and radiographic films are means which provide pertinent information to complement the results of articulation tests. 5 illustrative cases are presented.—M. F. Palmer.
3506. Newman, John B. (Queens Coll.) *The categorization of disorders of speech, language and communication.* *J. speech hear. Disord.*, 1962, 27(3), 287-289.—The author urges the concept of speech as the matrix of the therapist, since it is the item in language and communication that can be modified. The word "speech" is a generative and generalizing word in this professional field.—M. F. Palmer.
3507. Tate, Merle W., & Cullinan, Walter L. (U. Pennsylvania) *Measurement of consistency of stuttering.* *J. speech hear. Res.*, 1962, 5(3), 272-283.—Several measures of consistency of stuttering were used to investigate experimental data derived from the number of words stuttered on each of 5 successive readings of a 180-word passage and the number of words stuttered from zero to five times by each of 30 Ss. The scores for consistency were for percentage, consistency ratio, weighted percentage, maximum difference, and normal deviate measures. The percentage measure was unsatisfactory, and the consistency ratio measure appeared to be less satisfactory than weighted percentage, maximum difference, and normal deviate measures.—M. F. Palmer.
3508. Wingate, M. E. (U. Washington) *Evaluation and stuttering: II. Environmental stress and critical appraisal of speech.* *J. speech hear. Disord.*, 1962, 27(3), 244-257.—Review of the literature in regard to general conditions of stress in both the immediate and broader cultural environment on speech fluency and the presence of a label for stuttering. There is some suggestion of a positive correlation between stuttering and general conditions of stress, but largely in respect to our own culture. Evidence regarding the other 2 factors of stress on speech fluency and labelling is either highly questionable or negative.—M. F. Palmer.
3509. Young, Martin A., & Prather, Elizabeth Moodie. (Cleveland Hearing and Speech Cent.) *Measuring severity of stuttering using short segments of speech.* *J. speech hear. Res.*, 1962, 5(3), 256-262.—50 male college stutterers performed a speaking task which required spontaneous talking about a future vocation. 3 test tapes were constructed and labeled as total samples, randomly-selected segments, and consistently-selected segments. 20 second segments of speech are comparable to ratings of total samples when used for judgments of stuttering severity.—M. F. Palmer.

NEUROLOGICAL DISORDERS

3510. Adams, C. W. M. (Guy's Hosp. Medical School, London, England) *Histochemical aspects of myelination and demyelination.* *Develpm. Med. child Neurol.*, 1962, 4(4), 393-404.—"The histochemistry of normal myelination, cerebral lipidoses and demyelination are discussed, with the aim that greater knowledge of the cytochemical process of demyelination may suggest in what direction the aetiological agents for these diseases should be sought." (55-item bibliogr.)—T. E. Newland.
3511. Bookspun, Arnold. (Boston U.) *Hospitality in children with idiopathic epilepsy.* *Dissert. Abstr.*, 1961, 22(4), 1248.—Abstract.
3512. Clements, Sam D., & Peters, John E. (U. Arkansas Medical Cent.) *Minimal brain dysfunction in the school-age child: Diagnosis and treatment.* *Arch. gen. Psychiat.*, 1962, 6(3), 185-197.—A plan for careful history taking, specialized neurological examination, rigorously defined psychological examination and EEG, none of which must be omitted, and a treatment plan are outlined. (43 ref.)—L. W. Brandt.
3513. Cohen, Albert. (Jewish Vocational Service, Detroit, Mich.) *Personality aspects of multiple sclerosis.* *J. Rehabil.*, 1962, 28(3), 18-20; 50-51.—Cohen reviews the literature on the personality aspects of multiple sclerosis for the decade, 1950-61. The 29 references he reports appear to indicate to emphasize that there is no distinctive personality complex associated specifically with multiple sclerosis although certain characteristics such as high dependency needs, depression, anxiety, preoccupation with self, and insecurity are frequently found in this disease as they are in other catastrophic disability. Some indication of the influence of emotional factors and tension producing events in induc-

ing exacerbations of physical symptoms or remissions is indicated.—*M. A. Seidenfeld.*

3514. **Doran, P. A., & Guthkelch, A. N.** (Royal Manchester Children's Hosp.) **The epidemiology of spina bifida.** *Develpm. Med. child Neurol.*, 1962, 4(3), 307-309.—The possibility that spina bifida may be a recessive trait is explored.—*T. E. Newland.*

3515. **Driver, M. V.** (Maudsley Hosp., London, England) **A study of photoconvulsive threshold.** *EEG clin. Neurophysiol.*, 1962, 14, 359-367.—Some of the parameters of photoconvulsive threshold were studied in 77 patients with epilepsy, schizophrenia, or depressive illness. No important relationship between threshold and sex, age, body type, blood sugar, and haemoglobin was found. Body size was an important factor in determining amount of drug needed to reach threshold but the relationship between any expression of body size (e.g., weight, surface area, blood volume) were too low to be useful by themselves. A more refined end-point was suggested as a possibly more satisfactory index.—*L. C. Johnson.*

3516. **Hovey, H. B.** (VA Hosp., Salt Lake City) **Réponses des épileptiques aux tests psychologiques.** [The response of epileptics to psychological tests.] *Rev. Psychol. appl.*, 1961, 11(4), 293-296.—Studies are cited in which temporary reductions in intellectual functioning during tests in the part of epileptic Ss were noted. In a study involving 3 groups: (epileptics, brain-damaged, and psychiatric patients) the epileptics had a tendency to make non-pertinent remarks, followed by spontaneous responses to subsequent items. In the memory of drawings, one figure might appear less good than for the drawing in its entirety. Generalizing, transitory, and unexpected failures in the habitual efficiency of Ss is a sign of epilepsy or of a related condition. These transitory inefficiencies could be subclinical manifestations.—*W. W. Wattenberg.*

3517. **Ingram, T. T. S., & Naughton, J. A.** (U. Edinburgh) **Paediatric and psychological aspects of cerebral palsy associated with hydrocephalus.** *Develpm. Med. child Neurol.*, 1962, 4(3), 287-292.—Clinical findings in 16 patients and psychological findings in 20 patients (15 of them in common) are reported. Ages at first examination ranged from 3 to 15 years on 18 of the 20 patients, and some were observed in day and residential training situations. 10% were normal, and 40% were in the "ineducable" category. Vocabulary level tended to be above the general psychometric level, this being particularly true with respect to females. The 3 who were old enough to be evaluated as adults showed "more or less serious abnormality of behavior." Early treatment intervention should be considered seriously for prevention or mitigation.—*T. E. Newland.*

3518. **Lansdell, H.** (National Inst. Neurological Diseases & Blindness) **Laterality of verbal intelligence in the brain.** *Science*, 135 (Whole No. 3507), 922-923.—Patients with left-hemisphere epilepsy and their speech mechanism abnormally located in the right cerebral hemisphere are more similar in their verbal ability to ordinary patients with right-hemisphere epilepsy than to those with left-hemisphere epilepsy.—*Journal abstract.*

3519. **Rogina, V., & Serafetinides, E. A.** (Maudsley Hosp., London, England) **Epilepsy and behaviour disorder in patients with generalised spike**

and wave complexes. *EEG clin. Neurophysiol.*, 1962, 14, 376-382.—A series of 97 cases showing bilateral synchronous spike and wave (S-W) complexes during "resting" EEG conditions or elicited on overbreathing or photic stimulation was studied in relation to seizure pattern, presence of other EEG abnormalities, topographical distribution of the S-W complexes, signs of brain damage, and presence of behaviour disorder. In 82 cases S-W complexes appeared in resting EEG or on overbreathing alone whereas in 15 cases the discharges were elicited on photic stimulation alone. Epilepsy was by far the most frequent diagnosis in the former (74 out of 82) but more than half the cases in the latter group were patients with behaviour disorder or psychosis (8 out of 15), without clinical epilepsy.—*Author abstract.*

3520. **Sherwood, S. L.** **Relation of behavior to cerebral ventricular fluid protein levels.** *Arch. Neurol., Chicago*, 1962, 7(2), 146-159.—Ss were 60 cases referred for surgical treatment of behavior disorders. The amount of activity and reactivity of the patients was described using an Index of Excitement and Excitability (IEE) which was based upon clinical notes taken at different times by different observers. "A considerable degree of consistency" was found in that patients with a high IEE showed a raised ventricular fluid protein level; those with a low IEE showed a low-normal ventricular protein level. This relationship, however, was found not to hold true in all cases, especially where a gross neurological lesion, such as a tumor, was present.—*H. D. Arbitman.*

3521. **Small, J. G., Milstein, V., & Stevens, J. R.** **Are psychomotor epileptics different?** *Arch. Neurol., Chicago*, 1962, 7(3), 187-194.—"Specifically, we ask are patients with psychomotor epilepsy more likely to suffer psychopathologic disturbances than patients with equally severe convulsive disorders clearly nonpsychomotor in type?" Ss were 25 psychomotor epileptic patients, and 25 patients with "centrencephalic" seizures; Ss were equated for degree of focal and background EEG disturbance, clinical and social impairment, and general intelligence. Psychiatric interviews and psychological testing (WAIS, MMPI, Rapaport Word Association Test, Taylor Anxiety scale, and Wechsler Memory scale) did not differentiate patients with psychomotor epilepsy from patients with other kinds of convulsive disorders. "Indeed, a high and equal incidence of psychological difficulties appear in both groups."—*H. D. Arbitman.*

3522. **Tizard, Barbara.** (Inst. Psychiatry, Maudsley Hosp., London, England) **The personality of epileptics: A discussion of the evidence.** *Psychol. Bull.*, 1962, 59(3), 196-210.—"Five basic theories about the personality of epileptics are outlined, and the extent to which they have been affirmed or refuted by clinical and psychological investigations is considered. The findings of studies which have used the Rorschach test are shown to be contradictory, and the inadequacies of this test for research purposes are pointed out. It is argued that progress in this field depends on a recognition and study of the complex environmental and pathophysiological factors involved, and on the development of reliable criteria with which to classify epileptics."—*W. J. Meyer.*

3523. **Viktorov, I. T.** (Chair of Psychiatry, Leningrad Pediatric Medical Inst., USSR) **Oso-**
bennosti vysshēi nervnoi deiatel'nosti u detei pri

epilepsii. [Characteristics of the higher nervous activity in epileptic children.] *Zh. vyssh. nervn. Delatel.*, 1961, 11(6), 999-1004.—Ss were 10 epileptic boys (age 12-14) with different degrees of mental deterioration. Conditioned reflexes to red light were established by means of Ivanov-Smolenskii's method. It was found: (a) The greater the mental "degradation" of an epileptic child, the slower is the formation of CR. (b) With the increase of mental degradation the intensity of the excitatory process in the cerebral cortex declines while the duration of the excitation increases. (c) In epileptics with severe mental deterioration the motor CR bear a character of concreteness and preselection.—*A. Cuk.*

Brain Damage

3524. **Avakian, S. A.** (Fordham U.) **The applicability of the Hunt-Minnesota Test for organic brain damage to children between the ages of ten and sixteen.** *J. clin. Psychol.*, 1961, 17(1), 45-49.—2 groups of 18 boys each matched for intelligence, age, and grade were used as Ss. The experimental groups was selected in using the criteria of "had injury," and the control group, no "had injury" in their personal history. They were administered the Hunt-Minnesota Test for Organic Brain Damage. Findings provided strong support for the usability of the Hunt-Minnesota Test for Organic Brain Damage for diagnosis of deterioration in this age range.—*V. J. Bielianskas.*

3525. **Ayres, Anna Jean.** (U. Southern California) **Space perception and visualization in cerebral dysfunction.** *Dissert. Abstr.*, 1961, 22(5), 1708-1709.—*Abstract.*

3526. **Barsch, Ray H.** (Jewish Vocational Service, Milwaukee) **Evaluating the organic child: The functional organizational scale.** *J. genet. Psychol.*, 1962, 100(2), 345-354.—Extensive clinical experience in evaluating brain damaged children in a private agency setting has resulted in the formulation of a Functional Organizational Scale. The scale is composed of 30 items. The functions are those which may be measured by a variety of existing psychological tests yielding an age score. Observative functions are rated according to observational studies and reports to be found in the general literature in child development. Deductive items are rated after parental interviews, counseling, and sustained observation of the child. 3 terms have been employed to differentiate functioning levels: organized, immature, and disorganized. Relating total clinical findings to this scale enables the clinician to classify the child in terms of major impediments to learning. The 4 classifications are: Behavior, Symbolic, Immature, and Sensorimotor. Major emphasis is placed upon the concepts of organization of response patterns and learnability as the 2 crucial factors in the evaluation of organic children.—*Author abstract.*

3527. **Benton, A. L., & Spreen, O.** (State U. Iowa) **Zur Simulation intellektueller Leistungsdefekte im Benton-Test.** [On the simulation of intellectual achievement defects on the Benton-test.] *Psychol. Beitr.*, 1962, 7(1), 147-150.—An "experimental" simulation study was conducted in order to assess the influence of simulating behavior on the Benton test. Results of deliberately simulating Ss were compared with the results of brain-injured pa-

tients. Significantly different results between both groups were found and were discussed. (English & French summaries)—*H. J. Priester.*

3528. **Beyn, E. S., & Knyazeva, G. R.** (Inst. Neurology, USSR Acad. Medical Sciences, Moscow) **The problem of prosopagnosia.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(2), 154-158.—"A case of severe prosopagnosia (defect in physiognomic recognition) is reported in a case of bilateral occipital lobe lesion due to cerebrovascular disease. This defect was associated with some degree of agnosia for objects, and more especially for colours, and with marked failure in recognition of buildings, streets, and places. Visual memory exhibited a comparable defect in the reproduction of objects in their specific, though not in their generic, aspects. Intelligence and personality were well preserved. An analysis of the disability together with a course of rehabilitation was attempted. It is concluded that 'agnosia for faces and places' reflects failure in recognition at its most highly specific and individual level."—*M. L. Simmel.*

3529. **Costa, L. D.** (Albert Einstein Coll. Medicine) **Visual reaction time of patients with cerebral disease as a function of length and constancy of preparatory interval.** *Percept. mot. skills*, 1962, 14(3), 391-397.—8 brain damaged and 6 control Ss took part in an experiment on the effects of PI on visual RT. Control Ss had significantly lower RT's when presented with stimuli after constant PIs of short duration. No relationship obtained between PI and RT for brain-damaged Ss. Neither group showed change in RT at any PI as a function of practice over 180 trials. For all PI conditions singly and combined, the RTs of brain-damaged Ss are significantly slower than the RTs of control Ss.—*W. H. Guertin.*

3530. **Dils, C. W.** (Longview State Hosp., Cincinnati, O.) **The Colored Progressive Matrices as an indicator of brain damage.** *J. clin. Psychol.*, 1960, 16(4), 414-416.—The book form of the Colored Progressive Matrices was administered to 2 groups of 60 hospitalized Ss at a mental hospital. Both groups were matched or compared for age, education, sex, and length of hospitalization. 1 group of patients consisted of Ss without brain damage, the other with brain damage. "A special scoring system was devised that correctly identified 82% of the organics and 92% of the controls."—*V. J. Bielianskas.*

3531. **Doehring, D. G., & Reitan, R. M.** (Indiana U. Medical Cent.) **Concept attainment of human adults with lateralized cerebral lesions.** *Percept. mot. Skills*, 1962, 14(1), 27-33.—The Halstead Category Test was administered to 50 adults with lesions of the left cerebral hemisphere, 50 adults with lesions of the right cerebral hemisphere, and 50 nonbrain-damaged control Ss. The control group made significantly fewer errors. The groups with lateralized cerebral lesions did not differ significantly in total errors. All 3 groups were comparable with respect to the pattern of errors made on the subtests of the Category Test.—*W. H. Guertin.*

3532. **Hecaen, H., & Angelergues, R.** **Agnosia for faces (Prosopagnosia).** *Arch. Neurol., Chicago*, 1962, 7(2), 92-100.—Prosopagnosia is the incapacity of the patient to recognize people known to him solely on the basis of visual perception of their faces alone; recognition is accomplished by other cues such as

voice and gait. A review of the literature suggests a close association of the symptoms with lesions of the right hemisphere with concomitant visual-field defects. Findings in 8 of 10 surgically verified cases by the authors showed basal occipital lesions. Constellations of symptoms helpful in the differential diagnosis of this condition are listed. "It is concluded that, while a variety of mechanisms may be capable of modifying the process of recognizing faces, prosopagnosia is a perceptual deficit of a demonstrably specific nature."

—H. D. Arbibman.

3533. Heilbrun, Alfred B., Jr. (U. Iowa) **Issues in the assessment of organic brain damage.** *Psychol. Rep.*, 1962, 10(2), 511-515.—The importance of various problems in assessing brain damage is related to research goals. The major problems encountered when the goal is to maximize accuracy of selection of brain-damaged or nonbrain-damaged are contrasted with those which arise when the goal is a theoretical one of increasing knowledge of brain-behavior relationships. Research methods are discussed.—B. J. House.

3534. Hirschenfang, S. (Kings County Hosp. Cent., Brooklyn, N. Y.) **A comparison of Bender-Gestalt reproductions of right and left hemiplegic patients.** *J. clin. Psychol.*, 1960, 16(4), 439.—In order to obtain more specific data concerning the effect of brain damage in the dominant or nondominant hemisphere upon the performance on the Bender-Gestalt Test, this test was given to 2 groups of 50 institutionalized hemiplegic patients. Group I consisted of 25 right hemiplegics and Group II of 25 left hemiplegics. The Ss of Group I had brain damage in their dominant hemisphere and the Ss in Group II had lesions in the nondominant hemisphere. The Bender-Gestalt drawings were scored using the Pascall and Suttell method; the findings showed that the results of the left hemiplegics were significantly poorer than those of the right hemisphere patients.—V. J. Biliuskas.

3535. Kleist, K. (U. Frankfurt) **Sensory aphasia and amusia: The myeloarchitectonic basis.** (Trans. by F. J. Fish & J. B. Stanton) New York: Pergamon, 1962. 108 p. \$5.00.—The "comprehension of speech and the capacity for expressive speech, which is dependent upon it, are connected with an area in the temporal lobe which comprises the two transverse gyri, the posterior half of the first temporal convolution, and the posterior superior one-third of the second temporal convolution, together with the subcortical and deep white matter, including the auditory radiation from the medial geniculate body. . . . We may ascribe to [the second transverse gyrus] the appreciation of noises and of the specific characteristics of these sounds which have significance for speech. . . . Clinico-anatomical observations show that the comprehension and monitoring of phoneme sequences, that is, of words, is connected principally with the area posterior, while the area superior appears to be mainly responsible for the comprehension and monitoring of word sequences, especially of sentences. . . . There are still no definite indications of the anatomical sites for comprehension of the meaning of grammatically ordered word sequences, of sentences, and of speech, or for ordered thought in so far as this has a foundation in the acoustic aspects of speech. One can only make the negative statement that such territories must lie outside those areas of the temporal lobe of

which the language functions are so far known."—C. T. Morgan.

3536. Landmark, Margrete. (Oslo, Norway) **Visual perception and the capacity for form construction.** *Develpm. Med. child Neurol.*, 1962, 4(4), 387-392.—"The various attempts to explain the common finding that brain-damaged people cannot draw or copy figures at all well are discussed." A case is described in which visual perception is intact but the control of free movement is inadequate to the reproduction of a figure. Use of a ruler made possible the reproduction of the figure, however. Possible neuropathological concomitants are discussed.—T. E. Newland.

3537. Laufer, M. W., & Davids, A. (Emma Pendleton Bradley Hosp.) **Note on visual and figural aftereffects in the brain damaged.** *Percept. mot. Skills*, 1962, 14(1), 88.—Findings and theoretical views on visual and figural aftereffects are reviewed. The authors conclude that the spontaneous type of aftereffect in brain damaged Ss will be less marked because of low conductivity, and their findings appear to support this.—W. H. Guertin.

3538. Levine, M. (Devereux Found. Inst. Research & Training) **Discrimination in diffuse brain damage.** *Amer. J. ment. Defic.*, 1962, 67(2), 287-300.—Diffuse brain damaged Ss demonstrated significantly poorer discrimination sensitivity than emotionally disturbed and normal controls in 3 studies, employing different techniques as well as different groups of males and females. Discrimination sensitivity was found to correlate significantly with intelligence, particularly in the brain damaged Ss. It is suggested that discrimination, as a basic organismic process, warrants careful investigation since it is reasonable to suspect that such deficiency in discrimination has consequences for more complex psychological functions.—V. S. Sexton.

3539. Levine, M., & Spivack, G. (Devereux Found. Inst. Research & Training) **Adaptation to repeated exposure to the spiral visual aftereffect in brain damaged, emotionally disturbed, and normal individuals.** *Percept. mot. Skills*, 1962, 14(3), 425-426.—In a series of trials, normal and emotionally disturbed Ss showed a decrease in Spiral Visual Aftereffects duration sooner than brain damaged Ss. Normal and emotionally disturbed groups increased frequencies of failure to report SVA in later trials; the brain damaged group did not show this tendency. It is concluded that brain damaged Ss show a different adaptation pattern to SVA.—W. H. Guertin.

3540. Moor, Lucie. **Apports de la psychométrie a la neurophysiologie: Examen de 24 adolescents hémiplégiques en fonction de l'âge d'apparition et du côté de la lésion cérébrale.** [Use of psychometry in neuro-physiology: Study of 24 hemiplegic adolescents as a function of the age of onset and of the side of the cerebral lesion.] *Psychol. Franc.*, 1962, 7(1), 56-66.—The test battery included WISC, Terman Vocabulary Scale, Benton Visual Retention Test, Kohn Block Design Test, Goldstein-Sheerer classification, and other perceptual tests. 22 of the Ss studied became hemiplegic before the age of 3. The mean IQ of this group was 70. Their results on both verbal and performance scales were below average. 2 Ss developed the condition at age 13-14; their test results

were more in line with results obtained on adult hemiplegics.—C. J. Adkins.

3541. Thomas, H. B. G. (Cambridge U.) The "supervisor": A hypothetical mental function impaired by brain damage. *J. ment. Sci.*, 1962, 108 (Whole No. 454), 329-346.—Analysis of differences between brain damaged and normal performance in random writing of digits freely and with restrictions shows that information output rate increases linearly with symbol rate. Reversibility—return of a performance in unrestricted test to its initial level—is typical of normals. Monitoring of output is termed "the supervisor" and reaction time of the supervisor and rate of information feedback through the supervisor are also related to performance. The "hysteresis" which measures maladaptation by this information theory approach discriminates sharply between normal and brain-damaged Ss.—W. L. Wilkins.

3542. Tikhomirov, O. K. (Dept. Psychology, Moscow State U., USSR) Issledovanie optimal'nykh sposobov proverki gipotez v norme i patologii: Soobshchenie II. Narushenie osiatsatel'nogo uznaniia slozhnykh izobrazhenii [Optimal methods for checking hypotheses in normal and pathological cases: Communication II. Disturbances of tactile recognition of complex images.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 5, 89-92.—4 experiments with 1 S suffering from brain injury in the left parietal lobe. The purpose was to test his spacial orientation by identifying 2 checkers (representing 2 letters) on a checkerboard of 25 cells. A lack of spacial images was indicated by the fact that in all the experiments S used a great deal of superfluous information in order to carry out the different tasks.—A. Cuk.

3543. Weinstein, Edwin A., Marvin, Sidney L., & Keller, Niklaus J. A. (Walter Reed Hosp., Washington, D. C.) Amnesia as a language pattern. *Arch. gen. Psychiat.*, 1962, 6(4), 259-270.—Verbatim recordings were made of 2 or 3 weekly interviews with head traumata patients of whom 45 "developed marked and prolonged amnesia following brain injuries"; 45 had comparable brain injuries but with no, slight, or transitory amnesia; and 45 showed no or slight brain damage. Memories of last event prior to injury, selective forgetting, confabulations and retrograde amnesia were related to current problems. Patients' language in reference to not remembering "specifically indicated those areas of social relatedness through which identity had been achieved." It is concluded that amnesia is not explicable as a unitary memory defect or as a loss of motivation, but that like other forms of language its meaning varies with the organization of brain function and the social context in which it is expressed. (25 ref.)—L. W. Brandt.

Cerebral Palsy

3544. Barsch, Ray H. Rearing practices of parents of children with cerebral palsy: Toilet training. *Cerebral Palsy Rev.*, 1962, 23(5), 12-16.—The findings obtained by means of 20 self-administered questionnaires and a comprehensive individual interview for 51 families in a midwestern city are reported. The information on bowel training and nocturnal bed wetting is presented with respect to age of initiation of bowel training, length of time of such training, techniques employed, comparison with success with

nonhandicapped siblings, and frequency and pattern of bed wetting.—T. E. Newland.

3545. Benson, Jack F. (U. Miami, Coral Gables, Fla.) An analysis of the speech of cerebral palsied individuals in an effort to determine employability levels. *Cerebral Palsy Rev.*, 1962, 23(3), 9-13.—The speech of 50 Ss, 18 years of age and older, was studied, only as regards the individual's audible communicative speech. 89.2% of the judgments of 3 personnel men agreed on levels of employability with regard to the speech of the Ss. Ratings on articulation, rhythm, and rate were valid predictors of employability, with pitch and quality contributive in extreme cases.—T. E. Newland.

3546. Irwin, Orvis C. (U. Wichita) Substitution and omission errors by children with cerebral palsy in the articulation of triple consonant blends. *Cerebral Palsy Rev.*, 1962, 23(5), 5-6.—In the analysis of response of 200 Ss to Templin's test of triple consonant blends, omissions were found to exceed substitutions to a greater degree than reported in other studies.—T. E. Newland.

3547. Irwin, Orvis C. (U. Wichita) A test of triple consonant blends for use with children with cerebral palsy. *Cerebral Palsy Rev.*, 1962, 23(4), 9-11.—Templin's Test of Triple Consonant Blends was tried on 2 samples (100 each) of cerebral palsied children, 5-16 years of age, widely scattered geographically. The test was found satisfactory for use with such children, with the observation that "it may be found easy with some children."—T. E. Newland.

3548. Jensen, G. D., & Kogan, Kate L. (U. Washington, Seattle) Parental estimates of the future achievement of children with cerebral palsy. *J. ment. Defic. Res.*, 1962, 6(1), 56-64.—A questionnaire was designed to study the tendency of parents of handicapped children to over-estimate the children's ultimate level of achievement. Data were obtained from 110 parents of 68 children who were also rated by the staff at a treatment centre. Discrepancy between staff and parent rating was the unit of measurement used. The findings indicated that children who were handicapped both physically and intellectually were more likely to be over-rated by their parents than less handicapped children, and that younger children were more likely to be over-rated than older ones. Some of the practical implications of this kind of measure in a treatment centre were discussed.—A. Barclay.

3549. Maisel, R. N., Allen, R. M., & Tallarico, R. B. (U. Miami, Fla.) A comparison of the adaptive and standard administration of the Leiter International Performance Scale with normal children. *Cerebral Palsy Rev.*, 1962, 23(5), 3-4, 16.—46 private-school children (23 boys, 23 girls; CA range from 5-0 to 11-3) were administered the LIPS. For 16 of the children, internal consistency on the test was found by means of a split-half approach. The remaining 30 (15 matched pairs) took the LIPS by (rotated) standard and adapted procedures, which did not yield statistically different scores. Caution is advised against generalizing the findings to other adaptations.—T. E. Newland.

3550. Mitchell, Ross G. (U. St. Andrews, Dundee, Scotland) Mixed types of cerebral palsy. *Cerebral Palsy Rev.*, 1962, 23(3), 3-6, 13-15.—Of 240 cases of cerebral palsy, 23 were diagnosed as mixed

types (8 athetosis and spasticity, 7 ataxia and spasticity). 3 of the cases were considered to be post-natal in origin. The characteristics of each of the 7 mixed types are described, prevalence and etiology are discussed, and a summary of other reports of mixed types is presented. The use of the concept of mixed types is proposed over the practice of diagnosing in terms of the predominant disorder in view of attending special difficulties in education and employment. (30-item bibliogr.)—*T. E. Newland.*

3551. Nielsen, Helle H. (Rigshospitalet, Copenhagen, Denmark) **Visual-motor functioning of cerebral palsied and normal children.** *Nord. Psykol.*, 1962, 14(2), 43-103.—An experimental group comprising 2 matched subgroups of 20 children with spastic hemiplegia and 20 children with spastic paraplegia (aged 6-15) was compared with a matched control group on the Pender Visual Motor Gestalt Test, the Goldstein-Scheerer Cube Test, and the Rey Labyrinth Test. As hypothesized the experimental group did significantly poorer on all 3 tests with the hemiplegic children showing a tendency to do poorer than the paraplegic. 2 of the tests (Bender-Gestalt and Rey discriminated best between children of normal or above normal IQ; these 2 tests being found to correlate in the low IQ range for both the spastic and the normal groups. Differences between spastic and normal children were largest in the lowest age range (6-8 years). Pronounced individual differences were found: the intercorrelation among the 3 tests was low, with only 10% of the spastic children showing all signs of impaired visual-motor performance, 50% showing some of the signs, and 40% showing none of the signs (for the normal group the corresponding figures were 0%, 27% and 73%).—*L. Goldberger.*

3552. Nussbaum, Jacob. (New York U.) **An investigation of the relationship between the self-concept, mother concept and reality orientation of adolescents with cerebral palsy.** *Dissert. Abstr.*, 1962, 22(12), 4410-4411.—*Abstract.*

3553. Sato, Chiyoko. (Toyko) **A study of rhythm patterns of cerebral palsied children.** *Cerebral Palsy Rev.*, 1962, 23(5), 7-11.—25 children, 1st through 6th grades, were given a "time reproduction" music test and a "speed adaptation" test (responding at slower or faster tempo than the stimulus). The findings supported the conclusions (among others) that "cerebral palsied children can explore only a limited area of rhythmical expression"; differing rhythm patterns evoke "great confusion" in rhythmical expression; perseveration is a factor; intelligence appears not be a determining factor; and "it is very difficult to tell the proper time for going on to a next rhythm."—*T. E. Newland.*

3554. Young, Edna Hill. (Los Angeles, Calif.) **The moto-kinesthetic method as applied to the cerebral palsied.** *Cerebral palsy Rev.*, 1962, 23(3), 7-8.—The importance of identifying the structures involved in making the speech sounds, of providing the initial movement for the child, and of appropriate psychological timing of the work in speech is discussed and illustrated by means of a case history.—*T. E. Newland.*

MENTAL RETARDATION

3555. Barclay, A., Goulet, L. R., Holtgrewe, M. M., & Sharp, A. R. (St. Louis U.) **Parental**

evaluations of clinical services for retarded children. *Amer. J. ment. Defic.*, 1962, 67(2), 232-237.—Parental evaluations of clinical services provided for retarded children were obtained by questionnaire methods. An adequate respondent sample of parents was obtained. The evaluations and their implications are discussed.—*V. S. Sexton.*

3556. Barsch, R. H. (Easter Seal Child Development Cent., Milwaukee, Wis.) **The sub-trainable child: A community program.** *Amer. J. ment. Defic.*, 1962, 67(1), 33-40.—A specialized parent-child program is described. This program was organized for severely retarded children assumed to have little or no potential for later school participation. Over a 3-year period 45 children were enrolled. The significant findings that might be valuable for those attempting to work with this population are discussed.—*V. S. Sexton.*

3557. Baumeister, A., & Bartlett, C. J. (Central Michigan U.) **Further factorial investigations of WISC performance of mental defectives.** *Amer. J. ment. Defic.*, 1962, 67(2), 257-261.—In this investigation 2 factor analyses were done: (a) to determine whether or not the same correlation patterns of the WISC subtests underlie the performance of institutionalized Ss, and (b) to examine the correlation between the subtest Digit Span and the short-term memory factor. Essentially the same factor patterns were found for both institutionalized and non-institutionalized Ss, but the intercorrelations of the subtests tended to be considerably lower with respect to the former group. Analyses indicated that 4 factors underlie the performance of retardates on the WISC: General, Verbal, Performance, and Short-term Memory. The last factor is most closely identified with the subtests Digit Span, Coding, and Arithmetic.—*V. S. Sexton.*

3558. Begab, M. J. (United States Children's Bureau, Washington, D. C.) **Recent developments in mental retardation and their implications for social group work.** *Train. Sch. Bull.*, 1962, 59(2), 42-52.—The developments in mental retardation that have special implications for social group work are described.—*V. S. Sexton.*

3559. Bergman, J., Bethel, J., Pratt, R., & Lavis, L. W. (Glenwood State School, Ia.) **A community focused institutional approach to mental retardation.** *Amer. J. ment. Defic.*, 1962, 67(1), 94-100.—The Community Services Program of Glenwood State School is described. It is based on the recognition that institutionalization for the mentally retarded is but one of the many possible types of services for these disabled persons and their families. It recognizes the primary responsibility and desire of the family to meet the needs of its members. Because of the increasing complexity of society, it is often necessary for the community to assist the family in fulfilling its responsibility. Glenwood State School offers technical aid and assistance in appropriate use of its facilities and in the development of additional services to the fullest possible extent consistent with the desires of the community.—*V. S. Sexton.*

3560. Bialer, Irv. (George Peabody Coll.) **Conceptualization of success and failure in mentally retarded and normal children.** *J. Pers.*, 1961, 29(3), 303-320.—45 retarded and 44 normal children were given the following treatments: (a) a verbal

locus of control scale to evaluate whether he characteristically perceived events and outcomes as being internally or externally controlled. (b) a repetition choice situation to differentiate between responses to hedonistic cues and cues of success and failure, (c) a condition to estimate the child's commitment to an immediate or delayed gratification pattern. The data were analyzed by multiple correlation and factor analysis. "The results suggested that retarded children do not differ qualitatively from normal children in the development of the ability to conceptualize success and failure. However . . . it was concluded that retarded children are chronologically older than their normal counterparts at any given level of the conceptual development under consideration."—G. T. Lodge.

3561. Candland, D. K. & Conklyn, D. H. (Bucknell U.) **Use of the "oddy problem" in teaching mentally retarded deaf-mutes to read: A pilot project.** *Train. Sch. Bull.*, 1962, 59(2), 38-41.—A report is presented of a technique for teaching congenital deaf-mutes with reported mental retardation to read. This technique is based on the "oddy problem"—a discriminative behavior problem employed in animal research. The authors discuss research problems concerned with refinement of the technique.—V. S. Sexton.

3562. Carlson, Gordon John. (U. Washington) **The behavior of developmentally retarded children as a function of loss of reinforcement to a peer.** *Dissert. Abstr.*, 1961, 22(5), 1714.—Abstract.

3563. Chandler, Caroline A., Norman, Vivian B., & Bahn, Anita K. (National Inst. Mental Health) **The mentally deficient in outpatient psychiatric clinics.** *Amer. J. ment. Defic.*, 1962, 67(2), 218-226.—Data are presented on services to the mentally retarded throughout the United States, obtained from a nationwide reporting system. The data cover the following: number of facilities in the United States serving the mentally retarded, number of mentally deficient outpatients in psychiatric clinics, and clinic services.—V. S. Sexton.

3564. Clarke, A. D. B., & Cookson, Margaret. (Manor Hosp., Epsom, Surrey, England) **Perceptual-motor transfer in imbeciles: A second series of experiments.** *Brit. J. Psychol.*, 1962, 53(3), 321-330.—Earlier experiments tested a hypothesis derived from Hebb, that perceptual-motor transfer would be negatively correlated with age in imbecile Ss of 9, 17, and 23 years. On 4 tasks this hypothesis was strongly confirmed, with the youngest showing massive transfer of training compared with the older Ss, and almost reaching adult level. The present series of experiments included tasks of greater complexity. An unexpected finding was that the younger Ss were able, after 6 months of no-practice, to learn a more difficult sorting task more easily than the easier one 6 months earlier, thus showing the retention of learning set and improved perceptual and conceptual discrimination. Another experiment with the complex Minnesota formboards again showed greater transfer in children than in adults; here an initial average gap of 640 sec. between the performance of children and that of adults was narrowed to 45 sec. after 32 trials. Finally, after a year of nonpractice, adolescent and adult Ss were able to carry out a sorting task very much better than previously, indicating the long-term

effect of earlier learning. Implications for theory and practice are discussed.—*Journal abstract.*

3565. Cleland, C. C. (Abilene State School) **Severe retardation: Program suggestions.** *Train. Sch. Bull.*, 1962, 59(2), 31-37.—Forces that enter into programming are described in terms of ward design, behavioral characteristics of the group, physical characteristics, and the objectives of the program. Programs must be dynamic. They must be changed in line with findings of basic and applied research. Numerous major improvements can be instituted today because of increased federal, state, and local support of research.—V. S. Sexton.

3566. Copeland, R. (Parsons State Hosp., Kan.) **Therapy considerations for the institutionalized mentally retarded.** *Train. Sch. Bull.*, 1962, 59(2), 53-58.—Positive and negative aspects of the institutional setting are discussed with specific reference to speech therapy. The therapist is cautioned never to regard the institution as end-of-the-line termination for the patient. Realistic therapeutic goals demand that the institutionalized retardate be stimulated to develop verbal behavior appropriate to the community rather than to the institution.—V. S. Sexton.

3567. Davy, Ruth Ann. (Inst. Educational Research, Washington, D. C.) **Adaptation of progressive-choice method for teaching reading to retarded children.** *Amer. J. ment. Defic.*, 1962, 67(2), 274-280.—For a 2 year period an experimental reading program using Woolman's Progressive-Choice method was conducted in a school for trainable retarded children. Of the 13 Ss, 3 received 2 full school years of instruction, 7 had 1 school year, and 3 had less than 1 year. Results of testing before and after summer recesses showed that the children retained a large percentage of learned material. Those who participated in the program for 1 year progressed from a nonreading level to recognizing and writing most of the letters in the alphabet and to using these letters in a few simple words. In 2 years, 3 children aged 11-13, with IQs in the mid-50s, progressed from no functional reading to the level of reading meaningfully, with no or minimum help, sentences and stories considered appropriate for "normal" children at approximately the 1st-3rd grade reading level. Results indicate that a Progressive-Choice approach may be more efficient and effective in teaching mentally retarded children to read than methods commonly used.—V. S. Sexton.

3568. Deisher, Robert W., Balkany, Andrew F., Prewitt, Charles D., & Redfield, William J. (U. Washington) **Phenylketonuric families in Washington State.** *Amer. J. Dis. Children.*, 1962, 103(6), 818-821.—A report of a statewide effort to alert families and agencies dealing with PKU children for the purpose of preventing mental retardation in other children born in these families.—A. B. Warren.

3569. Dybwad, Gunnar. (National Ass. Retarded Children, NYC) **Mental retardation: A billion-dollar challenge.** *J. Rehabil.*, 1962, 28(3), 2.—An editorial comment by the author on the needs of the mentally retarded for special social consideration and the opportunity to achieve the fullest possible attainment in home, school, vocation, and the community.—M. A. Seidenfeld.

3570. Finley, C. J. (Teachers Coll., Columbia U.) **Arithmetic achievement in mentally retarded chil-**

dren: The effects of presenting the problem in different contexts. *Amer. J. ment. Defic.*, 1962, 67(2), 281-286.—3 hypotheses were tested (a) that arithmetic achievement of retarded children is independent of the context in which the problem is presented, (b) that arithmetic achievement of normal children is independent of the context in which the problem is presented, and (c) that there is no difference between the arithmetic achievement of retarded and normal children of the same mental age on instruments of like context. 54 educable retarded children and 54 normal 3rd grade children were tested using especially designed instruments—an individually administered concrete instrument and group administered pictorial and symbolic tests. The 1st 2 hypotheses were rejected. Significant differences were found for both retarded and normal Ss which indicate that performance on tests of arithmetic achievement is affected by the context in which the problem is presented. The 3rd hypothesis was accepted for the concrete and pictorial forms of the test but rejected for the symbolic forms, that is, the retarded did significantly better than the normal of same mental age on this test of computational skills.—V. S. Sexton.

3571. Fisher, G. M. (Fairview Hosp., Costa Mesa, Calif.) Further evidence of the invalidity of the Wechsler Adult Intelligence Scale for the assessment of intelligence of mental retardates. *J. ment. Defic. Res.*, 1962, 6(1), 41-43.—"This study further investigated the validity of the WAIS for the assessment of intelligence of mental retardates. WISC IQ's of 127 mental retardates were compared with their WAIS IQ's obtained after an average time interval of 5½ years. The mean WAIS IQ was 9.33 points higher than the mean WISC IQ. Data from the present study and those from an earlier study . . . were reviewed in support of the hypothesis that the WAIS is an invalid measure of the intelligence of mental retardates."—A. Barclay.

3572. Fleming, J. W. (Rainier School, Buckley, Wash.) The critical incident technique as an aid to in-service training. *Amer. J. ment. Defic.*, 1962, 67(1), 41-52.—This study attempted to show the usefulness of Flanagan's critical incident technique in obtaining empirical information useful for the establishment of a curriculum for patient-care aspects of in-service training. 10 college students in residence at a state institution for the mentally retarded reported on the staff-resident interactions they observed during a 4 week period. Each day 2 incidents were submitted, one describing an effective interaction and another an ineffective interaction. The scheme for classifying the 302 incidents is indicated and the implications of the findings are discussed.—V. S. Sexton.

3573. Fuller, Ray W., Luce, Merton W., & Mertz, Edwin T. (Fort Wayne State School, Ind.) Serum uric acid in mongolism. *Science*, 1963, 137 (Whole No. 3533), 868-869.—A highly significant increase ($P < .01$) in average uric acid level was found in the blood serum of mongoloids when levels were compared with those in normal control Ss or nonmongoloid, mentally retarded Ss. The possible relationship of these findings to other abnormalities known to exist in mongolism is discussed.—*Journal abstract*.

3574. Gibson, D. (Ontario Hosp., Smith Falls, Ont., Canada) The disputed bond between stigma

frequency and amentia in mongolism. *Amer. J. ment. Defic.*, 1962, 67(1), 90-92.—V. S. Sexton.

3575. Gragert, Herbert T. (Goodwill Industries Greater Kansas City, Mo.) Differential diagnosis, training, and job placement for the mentally retarded. *J. Rehabil.*, 1962, 28(3), 35-37.—A description of an OVR-sponsored project to provide vocational evaluation and training services for mentally retarded adolescents and adults in Missouri and Kansas. This 4-year-old program has provided services for 333 referred clients of whom 94 have been placed in jobs. About 70% received positive vocational services. Greater community participation and a broadening of the program is encouraged so that more clients who might otherwise be neglected may achieve their full potential.—M. A. Seidenfeld.

3576. Guskin, S. L. (George Peabody Coll. Teachers) The perception of subnormality in mentally defective children. *Amer. J. ment. Defic.*, 1962, 67(1), 53-60.—This study examined the influence of previous information and extent of observation upon the judged subnormality of certain mentally defective children. 4 children aged 9 to 14 with IQ's of about 50, were each observed in play by groups of naive Ss. The Ss, 45 college students, were asked to make a series of descriptive adjective choices following a brief soundless observation period and later again following a more extensive period when they were able to hear the child talking to a nursery school teacher. The adjectives most related in content to mental subnormality were combined into a single index of "perceived subnormality." Prior to observing a child, the Ss were told whether the child was mentally retarded, had a speech defect, what his true age was, or given no additional information. The author found that (a) giving the Ss the child's correct age resulted in greater perceived subnormality when the Ss had been allowed extensive observation, (b) telling Ss the child had a speech defect resulted in lower subnormality ratings, (c) labelling the child as mentally retarded had no influence upon perceived subnormality. It was found that whereas 3 of the children were seen as more subnormal upon further observation, the 4th child was seen as less subnormal the 2nd time.—V. S. Sexton.

3577. Heffelfinger, John C. (Coldwater State Home & Training School, Mich.) Progressive hydrocephalus. *Amer. J. Dis. Children.*, 1962, 103(6), 835-836.—A surgical procedure performed on 21 institutionalized hydrocephalics yielded no IQ changes but improved self-help and simplified care of the children.—A. B. Warren.

3578. Holowinsky, I. IQ Constancy in a group of institutionalized mental defectives over a period of 3 decades. *Train. Sch. Bull.*, 1962, 59, 15-17.—This study investigated the stability of IQ during the long-term residential placement of a group of retarded individuals. The total series showed no significant change in IQ. Apparently, long-term residency in a private institution for retarded children does not adversely affect IQ. In contrast to findings reported for nonretarded populations, the present series of retardates did not show any significant growth in mental age beyond life age 17. This suggests that in addition to being delayed in their rate of mental development, retardates may also reach their ceiling at a younger age than normals. Of those whose IQ changed, decline was more frequent in

individuals with IQs below 46. Children with higher IQs appear to be admitted to the Training School at an older age than their more retarded counterparts.—*V. S. Sexton.*

3579. Klausner, Max. (New York U.) **The attitudes of mothers toward institutionalized and non-institutionalized retarded children.** *Dissert. Abstr.*, 1961, 22(3), 915.—*Abstract.*

3580. Kniss, Janet T., Butler, A., Gorlow, L., & Guthrie, G. M. (Laurelton State School, Pa.) **Ideal self patterns of female retardates.** *Amer. J. ment. Defic.*, 1962, 67(2), 245-249.—The ideal self-attitudes of mentally retarded female adolescents were investigated. A 50-item Ideal Self-Attitude Scale was constructed and an unforced Q-sort technique was used to obtain a measure of ideal self attitudes. 79 Ss randomly selected from a defined subpopulation of institutionalized female retardates took the scale. 5 interpretable factors were revealed by factor analysis: 1 tended toward a general dimension of personal worth and physical health while the remaining 4 represented modes of getting along with people. No association was discovered between the factors and the variables of age, intelligence, and length of institutionalization. Overall reliability of the scale was found to be satisfactory. Explanations were presented for the lack of association and for intersubject variability in consistency of ideal self conceptualization.—*V. S. Sexton.*

3581. Lawson, J. R., & Avila, D. (U. Nebraska) **Comparison of Wide Range Achievement Test and Gray Oral Reading paragraphs reading scores of mentally retarded adults.** *Percept. mot. Skills*, 1962, 14(3), 474.—The Wide Range Achievement Test was shown to correlate .94 with the Gray Oral Reading Test for a group of adult defectives.—*W. H. Guertin.*

3582. Mein, R. (Harperbury Hosp., Herts, England) **Use of the Peabody Picture Vocabulary Test with severely subnormal patients.** *Amer. J. ment. Defic.*, 1962, 67(2), 269-273.—Use of the Peabody Picture Vocabulary Test (PPVT) with severely subnormal patients suggests that this test correlates highly with the Revised Stanford-Binet. Caution in the use of the PPVT with English Ss is suggested by a tendency for VA's (vocabulary age) to diverge significantly from MA's in the lower VA ranges, and by certain Plates being misplaced in order of difficulty. Patients of very low VA are shown to have specific difficulties in successful recognition of action pictures with object pictures.—*V. A. Sexton.*

3583. Meyerowitz, Joseph H. (Cornell U.) **Self-derogations in young retardates and special class placement.** *Child. Developm.*, 1962, 33(2), 433-451.—Of the 1807 entering 1st grade children, 120 were identified as having Binet IQs of 60 to 85. $\frac{1}{2}$ were randomly assigned to special classes and $\frac{1}{2}$ to regular classes. A criterion group of 60 normal children were identified to match the retarded sample with regard to area of residence, father's occupation, and family income. All Ss were tested with Illinois Index of Self-Derogation at the end of their 1st year of schooling. The retarded Ss were more self derogatory, in general, but those assigned to special classes were even more self derogatory.—*W. J. Meyer.*

3584. Morán, Roberto E. (U. Puerto Rico) **Levels of attainment of educable subnormal ado-**

lescents. *Brit. J. educ. Psychol.*, 1960, 30, 201-210.—300 English special-school subnormal children, 160 boys and 140 girls (CAs 14-16, mean 15.2; Terman-Merrill [TM] IQs 41-90, mean IQ 65.7, mean MA 9.5; Progressive Matrices [PM] IQs 55-99, mean 73.7, mean MA 10.7) were given tests of arithmetic, general information, language, reading, spelling, and craft. In each area except craft, Ss' mean attainment ages were lower than both their mean TM and PM MAs, their overall scores being comparable to those of "normal" 3rd-grade children. Subnormal Ss tend to score higher on the nonverbal PM than on the verbal TM, suggesting that instruction should be through visual rather than verbal media.—*C. T. Morgan.*

3585. Mosier, H. D., Grossman, H. J., & Dingman, H. F. (U. California Medical School, Los Angeles) **Secondary sex development in mentally deficient individuals.** *Child Developm.*, 1962, 33(2), 273-286.—"A survey of the age incidence of secondary sex development in an institutionalized population of mentally deficient males and females has shown that there is a tendency for a delay in the appearance of secondary sex features in the mentally retarded, when compared with a cross-section of the population as presented by Kinsey and Pryor. Differences within 4 diagnostic groups and 3 IQ groups of the mentally deficient patients were compared and found not to be statistically significant with the exception of axillary hair for the mongoloid girls between 14 and 17 years of age."—*W. J. Meyer.*

3586. Mullen, Frances A. (Board Education, Chicago, Ill.) **Une méthode inductive pour la détermination des aspects significatifs des réponses d'enfants déficients mentaux au T.A.T. et au Michigan Picture Test.** [An inductive method for determining significant aspects of the response of mentally deficient children to the TAT and the Michigan Picture Test.] *Rev. Psychol. appl.*, 1961, 11(4), 279-291.—Based on the records of 680 pupils examined in 1957-58 of whom 554 were reexamined in 1958-59 and 148 in 1959-60, several groups were formed: 2 random samples of 100 each and 3 chosen to represent well adjusted cases, poorly adjusted and hostile, and poorly adjusted but not hostile. A scoring scheme as to 140 characteristics of the stories with which the children had responded to the cards of the TAT and Michigan Picture Story Test was applied. 10 scales are being developed as follows: Weak Self-Concept, Hostility, Anxiety, Pessimism, Passivity, Positive Value System, Superego, Negative Value System, Optimism, and Scale X (probable illness and inefficient thinking). The system appears to have retained definite diagnostic validity while producing a scoring system objective to the point where reliability is achieved when protocols are scored by different persons.—*W. W. Wattenberg.*

3587. Murphy, M. M. (Southeast Louisiana Hosp.) **Hand preferences of three diagnostic groups of severely deficient males.** *Percept. mot. Skills*, 1962, 14(3), 508.—Left handedness has been reported to be greater among defectives. These data affirm this, with the Familial group significantly higher than Mongolians. Brain injured were intermediate.—*W. H. Guertin.*

3588. Patterson, R. G. (Edward R. Johnstone Training & Research Cent.) **Coordinates of "popularity" of institutional work supervisors.** *Amer.*

J. ment. Defic., 1962, 67(1), 29-32.—No significant relationships were found between the popularity of institutional work supervisors as rated by 109 mildly retarded adolescent trainees at an institution, and variables such as work supervisor's educational level, knowledge of retardation, and length of time worked with mental retardates. Most popular supervisors appeared to be characteristically patient, indulgent individuals, and less hampered by production schedules.—*V. S. Sexton.*

3589. **Probstein, I., & Kusuda, P.** (Central Wisconsin Colony & Training School) **Use of group techniques in the pre-admission process.** *Amer. J. ment. Defic.*, 1962, 67(2), 227-231.—The experiences of a social service department, in a large public welfare institution for the mentally retarded at Central Wisconsin Colony, in conducting a pre-admission service for parents of newborn infants and children under 7. Group techniques were used to deal with the many varied and complex effects that the birth of a mentally retarded child has on the family. They are considered sound and effective in the accomplishment of the unusually difficult goal. They are emphasized, however, as a tool and not a panacea for a solution.—*V. S. Sexton.*

3590. **Rundle, A. T.** (St. Lawrence's Hosp., Caterham, Surrey, England) **Etiological factors in mental retardation: I. Biochemical.** *Amer. J. ment. Defic.*, 1962, 67(1), 61-68.—3 groups of biochemical anomalies associated with mental deficiency are described: carbohydrate anomalies, amino-acid and protein anomalies, and the neurolipidoses.—*V. S. Sexton.*

3591. **Rundle, A. T.** (St. Lawrence's Hosp., Caterham, Surrey, England) **Etiological factors in mental retardation: II. Endocrinological.** *Amer. J. ment. Defic.*, 1962, 67(1), 69-77.—The following disorders are described: hypoparathyroidism, sex-chromosome anomalies, Turner's syndrome, Klinefelter's syndrome, double chromatin anomalies, nephrogenic diabetes insipidus, hypoglycaemia, dwarfism, sexual infantilism, and mongolism.—*V. S. Sexton.*

3592. **Saxton, G. H.** (Edward R. Johnstone Training & Research Cent., Bordentown, N. J.) **Spontaneous fantasy as a resource of high grade retardates for coping with a failure-stress frustration.** *J. abnorm. soc. Psychol.*, 1962, 64(1), 81-84.—Institutionalized high grade (60 IQ and above) retardates between the ages of 12 and 22 were divided into 2 groups on the basis of degree to which fantasy (as measured by a Fantasy Inventory) characterized their personality makeup. Ss were then placed in a frustrating situation (E making deprecatory remarks regarding S's tracing geometric designs). Post frustration, Ss were placed in a waiting room situation, one group permitted, the other not, to talk, smoke, and chew. High and low fantasizers were not generally distinguishable except by 2 of the subscales of an Attitude Questionnaire.—*G. Frank.*

3593. **Shepps, R., & Zigler, E.** (Yale U.) **Social deprivation and rigidity in the performance of organic and familial retardates.** *Amer. J. ment. Defic.*, 1962, 67(2), 262-268.—The present study tested 2 contradictory hypotheses: (a) that organic retardates are inherently more rigid than familial retardates of the same MA, (b) that organic and familial retardates of the same MA do not differ in

cognitive rigidity and that the rigid behaviors manifested by both groups reflect a heightened desire for social support and approval. A simple 2 part satiation type task was employed. $\frac{1}{2}$ the Ss in each group played the game under a nonsupport and $\frac{1}{2}$ under a support reinforcement condition. 3 measures were used: time spent on the game, errors made, and Kounin's causation index. The specific predictions derived from the motivational hypothesis were supported, while those derived from the opposing hypothesis were not. Findings were related to other investigations.—*V. S. Sexton.*

3594. **Silverstein, A. B.** (Pacific State Hosp.) **Note on terminology.** *Amer. J. ment. Defic.*, 1962, 67(2), 303-305.—Mental deficiency terminology is discussed. "Mental retardation," with its suggestion of delayed development is the current preference. This preference seems consistent with the present attitude of cautious optimism, as represented by an emphasis on active treatment, training, rehabilitation, and research.—*V. S. Sexton.*

3595. **Smith, Bessie S.** (Lower Peninsula Mental Hygiene Clinic, Newport News, Va.) **The relative merits of certain verbal and non-verbal tests in the second-grade level.** *J. clin. Psychol.*, 1961, 17(1), 53-54.—"Three intelligence tests and a reading test were individually administered to 100 second-grade pupils to discover whether tests requiring neither speech nor manipulation would correlate well enough with the WISC IQs of normal children to justify experimenting with them as a means of predicting the educability of severely handicapped children." All correlations were positive and better than chance, but only the average of the Full-Range Picture Vocabulary and California Mental Maturity Scale IQs showed promise of being useful.—*V. J. Bielianskas.*

3596. **Sternlicht, M., & Wanderer, Z. W.** (Willowbrook State School, Staten Island, N. Y.) **Nature of institutionalized adult mongoloid intelligence.** *Amer. J. ment. Defic.*, 1962, 67(2), 301-302.—Certain findings, which have been replicated by a recently completed West Coast study are presented: (a) The average institutionalized mongoloid adult is about 27 years of age. (b) The average MA is about 3.5 years. (c) The average IQ, as determined by the Revised Stanford Binet (Form L), is 24. (d) Sex differences in intelligence were observed in the East Coast study, but not in the West Coast study.—*V. S. Sexton.*

3597. **Van Pilsum, J. F., & Halberg F.** (U. Minnesota Medical School, Minneapolis) **A method for the determination of argininosuccinic acid in human urine.** *Amer. J. ment. Defic.*, 1962, 67(1), 82-89.—A description is given of a screening procedure for argininosuccinic acid in human urine. Amounts of the acid greater than approximately 300-500 mg./day may be detected. 192 mentally retarded patients at the Cambridge Minnesota State School and Hospital were screened for this acid. No cases were found. Since argininosuccinic aciduria is relatively rare in mentally deficient populations, a simple, yet specific, procedure is believed to be needed. The procedure described in this paper may be useful in large scale investigations of this aspect of mental retardation.—*V. S. Sexton.*

3598. **Wagner, Henry R.** (Kauaikeolani Children's Hosp., Honolulu) **Mongolism in orientals.** *Amer. J. Dis. Children*, 1962, 103(5), 706-714.—A descrip-

tion of the characteristics of mongolism in a group of 29 oriental mongoloid children and comparisons with Caucasian mongoloids.—A. B. Warren.

3599. Warren, Sue A., & Kraus, M. J., Jr. (Oregon Fairview Home, Salem, Ore.) **WAIS Verbal minus Performance IQ comparisons in mental retardates.** *J. clin. Psychol.*, 1961, 17(1), 57-59.—150 Ss, 75 males and 75 females, who were newly admitted to a state institution for mentally retarded and epileptic patients were given the WAIS Full Scale. The results were compared in terms of the achievement of the Verbal vs. Performance IQs. The IQ ranges of these Ss were between 46 and 79 and 75% of them had a higher Performance IQ than Verbal. However, "the difference between Verbal and Performance IQ for 'lower IQ' Ss was less clear-cut, with the mean of the differences being less than 1 point and with 35% of this group having Verbal IQ greater than Performance IQ."—V. J. Bieliasukas.

3600. Wolinsky, Gloria. (Hunter Coll., NYC) **Piaget and the psychology of thought: Some implications for teaching the retarded.** *Amer. J. ment. Defic.*, 1962, 67(2), 250-256.—Piaget's theory and method are described together with their implications for teaching the exceptional. Current use of Piaget's premises on the retarded are also indicated.—V. S. Sexton.

3601. Woodward, Mary. (University Coll., Swansea, United Kingdom) **The application of Piaget's theory to the training of the subnormal.** *J. ment. Subnorm.*, 1962, 8(1, Whole No. 14), 17-25.—A discussion of the applicability of Piaget's concepts of the nature of thought processes in the child to the development of perceptual and conceptual skills in the retarded child, with emphasis upon the use of manipulative materials designed to develop such skills.—A. Barclay.

3602. Wright, Stanley W., Valente, Mario, & Tarjan, George. (Pacific State Hosp., Pomona, Calif.) **Medical problems on a ward of a hospital for the mentally retarded.** *Amer. J. Dis. Children*, 1962, 104(2), 142-148.—Physical, neurological, and medical problems of young, severely retarded, hospitalized children are described.—A. B. Warren.

3603. Zeaman, David; & House, Betty J. (U. Connecticut) **Approach and avoidance in the discrimination learning of retardates.** *Child Developm.*, 1962, 33(2), 355-372.—"Three discrimination learning experiments were carried out on 42 imbecile children with MAs of about 4 years. The goal of the study was to find out if the effect of a reward (approach tendency) was strong or weak in comparison with the effect of a nonreward (avoidance tendency). Three experimental techniques were used in the analysis: the ambiguous cue method, the cue-substitution method, and the conditional-reaction problem. . . . Approach tendencies were formed more rapidly than avoidance early in learning. Approach and avoidance tendencies have approximately equal strengths in an established discrimination. Retardates do not appear to differ, in the above respects, from other Ss."—W. J. Meyer.

3604. Zigler, Edward. (Yale U.) **Social deprivation in familial and organic retardates.** *Psychol. Rep.*, 1962, 10(2), 370.—Test results indicating more social deprivation experience among 20 familial retardates than 20 organic retardates "lends credence

to the hypothesis that reported differences in the performance of the two types of retardates are due in part to motivational differences in the two populations."—B. J. House.

BEHAVIOR PROBLEMS

3605. Dracoulides, N. N. **Défémínisation de la femme survalorisée et infantilisme d'adultes et de jeunes.** [Defeminization of the overvalued woman and resulting infantilism in adult and young men.] *Acta psychother. psychosom.*, Basel, 1962, 10(1), 53-61.—The modern post-war woman induces mother-search in the young man, regression in the adult. Maternal tendencies, power, and domination are manifest in turn. Emancipation and overestimation are not the same. By losing her femininity, a woman is unable to be either man or woman.—G. Rubin-Rabson.

3606. Finkelstein, J. **A propos de quelques conduites masochiques.** [Certain types of masochistic behavior.] *Rev. Franc. Psychanal.*, 1962, 26(1), 67-86.—Several theories of masochism—life and death instincts, self-punishing aggression directed against the self, masochistic object-relation, correlations of masochism and homosexuality, masochism and narcissism, masochism and introjection or sublimation—are considered inadequate. The author illustrates other dynamics through case presentations.—G. Rubin-Rabson.

3607. Offergeld, H. (Gruenewaldstr. 60, Köln-Muengersdorf, Germany) **Psychische Änderungen bei sexueller Umstellung: Ein Kapitel aus der psychologischen Gynäkologie.** [Psychic changes accompanying changes in sexual life: A chapter from psychological gynecology.] *Z. psycho-som. Med.*, 1962, 8(1), 31-35.—When a nondyspareunic woman with normal sexual experience gives up her regular sex contact with her compatible, potent partner, she experiences changes in her psychic-mental sphere. The changes will be proportionate with the abruptness of the imposed sex abstinence. Transient occasional resumption of sexual experience in such women is not recommended.—I. Neufeld.

Alcoholism

3608. Krimmel, H., & Falkey, D. B. **Short-term treatment of alcoholics.** *Soc. Wk.*, 1962, 7(3), 102-107.—Short term psychotherapy of alcoholics has proven successful with as large a percentage of patients as longer therapeutic procedures. Short term therapy is most effective with nonchronic alcoholics who have good family and emotional resources; it is least effective where there is chronic alcoholism coupled with deep emotional disorders.—G. Elias.

3609. McCord, Hallack. (U. Colorado) **Hypno-therapy and alcoholism.** *J. Amer. Soc. Psychosom. Dent. Med.*, 1962, 9(3), 83.—24 psychotherapists responded to questionnaires which "were analyzed for clusters of opinion and thought." Considerable variance in both usage and successes were reported.—J. H. Manhold, Jr.

3610. Pittman, David J., & Snyder, Charles R. (Eds.) (Washington U., St. Louis, Mo.) **Society, culture, and drinking patterns.** New York: Wiley, 1962. xvii, 616 p. \$9.75.—Of 35 chapters in this comprehensive review of research utilizing the sociological approach to the study of deviant behavior, 23 are original for this volume. New studies in the

anthropological perspective introduce sections dealing with class, status, religion, ethnicity, age, sex, family, occupation, personality, role deviation, suicide, and crime. Systems of control are summarized.—*W. L. Wilkins.*

Sex Deviation

3611. Bolland, Gerhard. (U. Jena) *Über die Behandlung der psychogen bedingten Impotenz.* [Treatment of psychogenically caused impotence.] *Prax. Psychother.*, 1962, 7(3), 105-111.—The psychogenic causes and treatment of several cases of impotence are described by the Director of an East German polyclinic. The causes of the impotence described are comparatively superficial and are treated by encouraging self-understanding.—*W. Swartley.*

3612. Coates, S. *Homosexuality and the Rorschach test.* *Brit. J. med. Psychol.*, 1962, 35(2), 177-190.—"All the cases of homosexuality referred for Rorschach investigation to one psychologist at one clinic over a period of 6 years were considered (a) to investigate their response to treatment, (b) to find what aspects of the history, or of the Rorschach test, might predict the outcome. There are forty-five such cases: thirty-three over 21 years, twelve between 14 and 21 years. Ten (30%) of the adults and eight (67%) of the boys showed improvement. Those adult patients who had had some heterosexual experience and whose Rorschach records showed the 'catastrophic' reaction to card II appeared to have a greater probability of success in treatment."—*C. L. Winder.*

3613. Fazio, M., & Albano, I. *Osservazioni psicosociologiche su quaranta meretrici detenute.* [Psychosociological observations on forty prostitute inmates.] *Difesa. soc.*, 1962, 41(1), 126-137.—Findings of an inquiry about the socioeconomical background of 40 jailed prostitutes.—*L. L'Abate.*

3614. Garfield District staff of the Family Service Association. (Cleveland, O.) *Infidelity in women as a manifestation of a character disorder.* *Smith Coll. Stud. soc. Wk.*, 1962, 32(3), 180-198.—Analysis of 10 cases of sexual infidelity among female agency patients showed that their infidelity reflected character disorders which anteceded marriage. These women were seeking the mother love they had been denied in childhood, and they were using the excitement of extramarital affairs to fill the void left by this early lack.—*G. Elias.*

3615. Göppert, H. (U. Freiburg, Germany) *Personale sexualpathologie.* [Personal sexual pathology.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 228-242.—"The neuroses are primarily sexual crises." With this thesis the author approaches the sexual perversions as types of neuroses and considers them as crises of the existence which are experienced in the boundaries of childhood and maturity, selfishness and partnership, bisexuality and heterosexuality, childish dream world and reality, timelessness and finality. The Freudian theory concerning the edipus complex is modified and a psychoanalytic explanation of neurosis is enlarged. Support is provided from clinical cases, theories, and also studies of drawings of human figures with the inclusion of 6 actual examples. The meaning of the sexual crisis for human existence is proposed and evaluated.—*V. J. Bieleuskas.*

3616. Klintworth, Gordon K. (Duke U. Medical Cent., Durham, N. C.) *A pair of male monozygotic twins discordant for homosexuality.* *J. nerv. ment. Dis.*, 1962, 135(2), 113-125.—"A 20-year-old monozygotic twin pair discordant for male homosexuality is presented. The literature on male one-egg-twins that are alleged to be discordant for male homosexuality is reviewed. The absence of complete concordance for male homosexuality in monozygotic twins can be adequately explained in terms of well accepted genetic concepts. The homosexuality in the one twin can also be construed by psychoanalytic theories."—*N. H. Pronko.*

Wk.*, 1962, 32(3), 199-204.—Agrees with the finding of the Garfield Report that infidelity among married women represents deeper character disorders and cites other cases which confirm this finding.—*G. Elias.*

Drug Addiction

3618. Clark, John A. (Crichton Royal, Dumfries, Scotland) *The prognosis in drug addiction.* *J. ment. Sci.*, 1962, 108(Whole No. 455), 411-418.—Of 120 patients seen from 1949 to 1960 at Crichton Royal, 65 belonged to medical or nursing professions, and 50 of these could be thoroughly followed up. Psychiatric illness preceded or accompanied addiction for 20 of the 50, and of these 13 showed previous sociopathic behavior; the other 30 showed no evidence of any psychological disorder. 28% overcame their addiction; 52% required further hospitalization. 30% had continued at their profession, but 26% had had no gainful employment following discharge from hospital. Prolonged hospitalization is recommended and the possibility of vocational counseling toward a different occupation is considered.—*W. L. Wilkins.*

3619. Frazier, T. L. *Treating young drug users: A casework approach.* *Soc. Wk.*, 1962, 7(3), 94-101.—Selective use of short term casework counseling is recommended, and some of the experiences of the author while using this technique with institutionalized late-adolescent addicts are related.—*G. Elias.*

3620. Headlee, C. P., Coppock, H. W., & Nichols, J. R. (U. Oklahoma) *Apparatus and technique involved in a laboratory method of detecting the addictiveness of drugs.* *J. Pharmaceut. Ass., Scient. Ed.*, 1955, 44(4), 229-231.—Following 14 daily injections, a significant increase in relative duration of a lateral head position occurred when that position caused morphine or codeine to be injected at 0.1 cc per min. A similar change occurred in previously uninjected animals when the head position caused injection of glucose, and an opposite change occurred when insulin was injected.—*Author abstract.*

3621. World Health Organization, Expert Committee on Addiction-Producing Drugs. *Eleventh report.* *WHO tech. Rep. Ser.*, 1961, No. 211. 16 p.—Notifications of new drugs characterised as addiction-producing together with the list of drugs under international narcotics control.—*J. C. Franklin.*

Suicide (& Homicide)

3622. Applebaum, S. A., & Holzman, P. S. (Menninger Found.) *The color-shading response and suicide.* *J. proj. Tech.*, 1962, 26(2), 155-161.—Color-shading determinant was found significantly

more among suicide and attempt groups than among controls. Color-shading responses are discussed in relation to suicide-potential as they reflect sensitive, articulate and penetrating, insightful activity with perhaps clarification of a single problem area and a resultant loss of overall perspective.—*A. F. Greenwald.*

3623. LeShan, Lawrence. (Inst. Applied Biology, NYC) **Cancer mortality rate: Some statistical evidence of the effect of psychological factors.** *Arch. gen. Psychiat.*, 1962, 6(5), 333-335.—The Pearson "r" between suicide and cancer mortality rates for 1914-1953 is found to be significant on the .01 level indicating that both may be influenced by a common factor. (21 ref.)—*L. W. Brandt.*

3624. Neuringer, Charles. (Suicide Prevention Cent., Los Angeles, Calif.) **Dichotomous evaluations in suicidal individuals.** *J. consult. Psychol.*, 1961, 25(5), 445-449.—Using a Semantic Differential Test, suicidal and psychosomatic Ss make more extreme value judgments and show greater differences between opposing concepts than do controls. "Dichotomous Evaluative Thinking seems to be a common characteristic of emotionally disturbed persons."—*E. R. Oetting.*

3625. Stengel, Erwin. (U. Sheffield, England) **Self-destructiveness and self-preservation.** *Bull. Menninger Clin.*, 1962, 26(1), 7-17.—The psychoanalytical literature on suicide is briefly surveyed. Suicidal acts (suicides and suicidal attempts) express the coexistence of the impulses springing from love and from hate. The majority function as alarm signals and appeals for help and thus reinforce the urge for self-preservation. Suicidal attempts should not be regarded as nothing but abortive suicides.—*W. A. Varvel.*

3626. Tuckman, Jacob, & Connon, Helen E. (Philadelphia Dept. Public Health) **Attempted suicide in adolescents.** *Amer. J. Psychiat.*, 1962, 119(3), 228-232.—A study was made of 100 consecutive attempted suicides by children and adolescents under the age of 18. An important finding concerns the association between attempted suicide on the one hand and family disorganization and delinquency on the other.—*N. H. Pronko.*

3627. Urban, William H. (Coll. Osteopathy & Surgery, Kirksville, Mo.) **Suicide: A cultural and semantic view.** *Ment. Hyg., N. Y.*, 1962, 46(3), 377-381.—After reviewing psychoanalytic and sociological (Durkheim) views of suicide, Urban discusses the linguistic and communicative aspects of suicide. He emphasizes the cultural implications, the connotations, and the great variety of denotative meanings of suicide.—*M. H. Lewin.*

CRIME & DELINQUENCY

3628. Alberts, William Edward. (Boston U.) **Measuring ministers' attitudes toward juvenile delinquency.** *Dissert. Abstr.*, 1961, 22(4), 1262.—*Abstract.*

3629. Bennett, L. A., & Rudoff, A. (California Dept. Correction, Sacramento) **Changes in direction of hostility related to incarceration and treatment.** *J. clin. Psychol.*, 1960, 16(4), 408-410.—Peizer's study, in which Rosenzweig P-F study was used on prisoners, showed that the incarceration of the Ss tended to shift their "extrapunitive" tendencies

to "intropunitive." This study used the same technique on younger Ss. The Ss included 300 randomly selected male adults, age 17-21, who besides being incarcerated were given therapeutic care. The results tended to support Peizer's findings, except that with the progress of therapy "intropunitive responses tended to decrease." However, there seemed to be no significant relationship between extrapunitive behavior and length or intensity of treatment.—*V. J. Bieliauskas.*

3630. Caditz, S. B. (King County Juvenile Court, Seattle, Wash.) **Effects of a forestry camp experience on the personality of delinquent boys.** *J. clin. Psychol.*, 1961, 17(1), 78-81.—17 boys were selected from 195 cases judged delinquent, by the value scores of the State of Washington, for the forestry program and were administered the MMPI, both before camp placement and 6 months later. The findings were compared with a similar group of boys assigned to a training school and with nondelinquents. A difference between the nondelinquents and the forestry camp and training school boys was evident in the Pd score on the MMPI. The findings showed a significant reduction of delinquent identification in the forestry camp as compared to the training school boys, although some delinquent attitudes still remained noticeable. The conclusion was drawn that, for some delinquent boys, the forestry camp experience is associated with improvement in social attitudes and level of emotional maturity.—*V. J. Bieliauskas.*

3631. Craddick, Ray A. (New Mexico State U.) **Selection of psychopathic from non-psychopathic prisoners within a Canadian prison.** *Psychol. Rep.*, 1962, 10(2), 495-499.—A check list of 12 items, developed from descriptions of psychopaths in psychiatric literature and ratings by 10 psychiatrists, was used to rate 118 male, literate, Canadian prisoners of average intelligence. Profiles from MMPI were compared for the 27 highest and 27 lowest scorers. "Differences beyond the .01 level were found between the groups on the Pd + .4K and Ma + .2K scales, and a difference beyond the .05 level for the Pt + 1K scale. A two-year follow up indicated that 16 of the psychopaths and 2 of the non-psychopaths were known to have returned to some Canadian prison. On the basis of these findings, the check list appears to be a useful instrument in differentiating the psychopath from the non-psychopath within a prison setting."—*B. J. House.*

3632. Deutsch, Martin. (New York Medical Coll.) **The 1960 swastika-smearings: Analysis of the apprehended youth.** *Merrill-Palmer Quart.*, 1962, 8(2), 99-120.—Information obtained by interviewing 41 youths apprehended after acts of swastika smearing and vandalism was supplemented with data from other sources. The group was widely scattered geographically; age range was 11-25; median age was 16. Of these Ss, 22 exhibited ideological commitment to either Nazism, racism and/or anti-Semitism. The nonideological group appeared to be engaging in imitative antisocial behavior. "For all the youth there is some combination of family instability, school failure, social pressure and community isolation, psychological inadequacy, absence of acceptable figures for identification, and a general . . . neglect of their needs." The author discusses implications for personality theory and contemporary America.—*E. L. Robinson.*

3633. Epstein, Eleanor M. The self concept of the delinquent female. *Smith Coll. Stud. soc. Wk.*, 1962, 32(3), 220-234.—The author was surprised that her study revealed "impressive similarities" between a delinquent and a nondelinquent group with regard to structural properties of the self. Significant differences were found, however, in the content of the self concept held by the 2 groups. The delinquent's self portrayal was more highly negativistic of self and of future goals, and less marked by group identification than was that of the nondelinquent.—G. Elias.

3642. Lively, Edwin L., Dinitz, Simon, & Reckless, Walter C. Self concept as a predictor of juvenile delinquency. *Amer. J. Orthopsychiat.*, 1962, 32(1), 159-168.—A cross-sectional assessment of 12-15-year-old children in Akron suggests that the direction of socialization and an unfavorable or favorable self image are the most tangible components of insulation against or propulsion toward delinquency.—R. E. Perl.

3643. Majumdar, A. K., & Roy, A. B. Latent personality content of juvenile delinquents. *J. psychol. Res., Madras*, 1962, 6(1), 4-8.—The common Rorschach characteristics in the delinquent personality were found to be: high F%, increase in Ad responses, decrease in W responses, FM predominating M, high A%, low h%, and increase in d, dd, and add responses.—U. Pareek.

3644. Morris, Terence, & Morris, Pauline. (London School Economics, England) The experience of imprisonment. *Brit. J. Criminol.*, 1962, 2(4), 337-360.—The physical and psychological conditions at Petonville, a maximum security prison in North London, are described. Reactions to these conditions are seen as a function of the prisoner's perception and capacity to adjust. Sex was found to be a major problem of adjustment, and loss of identity and deprivation of autonomy and personal security also contribute to social and personal deterioration. Prisonization is defined as the "continuous and systematic destruction of the psyche . . . which may frequently make it impossible for the individual to act successfully in any normal social role." The typology of adaptation is described in terms of conformity, innovation, ritualism, retreatism, rebellion, and manipulation.—M. P. Argyropoulos.

3645. Myers, Georgie. Associaux et inadaptes devant le pretoire. [The asocial and maladjusted before the bench.] *Hyg. ment.*, 1961, 50(5), 329-345.—A lawyer discusses some of the factors, both psychological and sociological, responsible for criminal activity and juvenile delinquency. A major factor is the growth of egotism in the younger generation to the detriment of social consciousness and deference to the well-being of others. The time will come when we will no longer seek to punish public offenders, but to re-educate and rehabilitate.—W. W. Meissner.

3646. Naess, Siri. (U. Oslo) Mother separation and delinquency: Further evidence. *Brit. J. Criminol.*, 1962, 2(4), 361-374.—The study is an attempt to test John Bowlby's hypothesis on mother separation

and delinquency. In the 1st part of the study (1958) 42 Oslo delinquents constituted the experimental group; their nondelinquent brothers were used as controls. The results disconfirmed Bowlby's hypothesis. In the 2nd part of the study (1960) 3 more groups of delinquents were selected and compared. 2 of these were selected from the clientele of a child guidance clinic in Oslo and thus resembled Bowlby's sample. The results led to the conclusions that (a) early mother-child separations are more prevalent among delinquents, (b) separation frequency is higher among boys committing more serious offenses than among boys committing less serious offenses, (c) mother-child separation as such is a minor criminogenetic factor.—*M. P. Argyropoulos*.

3649. **Rao, C. K. Vasudeva.** Intelligence in a group of convicts: An analysis of 35 cases. *Trans. All-India Inst. Ment. Hlth.*, 1960, 1, 44-53.—Raven's Progressive Matrices, the Alexander passalong test, and Porteus Mazes were administered to 60 convicts. Delinquents were of below normal intelligence. Age, education, and socioeconomic conditions were positively correlated with intelligence. House breakers and those with multiple convictions had higher scores than other offenders.—*U. Pareek*.

3650. **Shelley, Ernest L. V., & Johnson, Walter F. Jr.** (Michigan Dept. Corrections) Evaluating an organized counseling service for youthful offenders. *J. counsel. Psychol.*, 1961, 8(4), 351-354.—An intensive group and individual counseling program led to greater decrease in anti-social responses on the Thematic Apperception Test than occurred in a matched group in a minimum security camp. Decrease in responses is significantly related to parole success.—*E. R. Oetting*.

3651. **Stickler, James Irwin.** (Temple U.) Some personality traits of juvenile delinquents as indicated by a rating technique utilizing the Symonds Picture-Story Test. *Dissert. Abstr.*, 1961, 22(3), 919.—*Abstract*.

3652. **Tiffany, T. L., Peterson, D. R., & Quay, H. C.** (U. Illinois) Types and traits in the study of juvenile delinquency. *J. clin. Psychol.*, 1961, 17(1), 19-24.—"For this investigation, Q-technique was used to analyze the responses of delinquent boys to carefully selected verbal stimuli. One hundred statements associated with previously defined Type-R dimensions of 'psychopathy,' 'neuroticism,' and 'inadequacy' were sorted by 103 delinquent boys into a five-class normal distribution, depending on the strength of agreement which each item evoked." Factor analytic evaluation of the data failed to show any structure in the data, suggesting that "delinquents did not 'naturally' group themselves into distinct types."—*V. J. Bieliauskas*.

3653. **Toby, Jackson.** (Rutgers U.) Criminal motivation: A sociocultural analysis. *Brit. J. Criminol.*, 1962, 2(4), 317-336.—In heterogeneous cultures conformity to accepted norms is achieved through (a) external factors (lack of opportunity to

learn criminal skills and fear of punishment), and (b) internal controls (guilt and shame). These are operative to varying degrees with the different individuals due to the diversity of socializing agents and group pressures. Crime arises when the temptation to violate a rule is stronger than the individual's guilt feelings and fear of social disapproval. "Socially disorganized" communities have high rates of criminality mainly because of low motivation to conform to society's rules. The criminal is defined as the person who has come to think of himself as a criminal.—*M. P. Argyropoulos*.

3654. **Toch, Hans. (Ed.)** (Michigan State U.) *Legal and criminal psychology*. New York: Holt, Rinehart & Winston, 1961. xviii, 426 p. \$6.00.—An extensive collection of articles by practitioners in the fields of law and correction and social scientists. The authors explore the psychological aspects of the process of criminal justice and treatment of the social offender. The 1st section covers topics such as trial tactics, jury system, and judicial behavior. The 2nd section concerns itself with the causes of criminal behavior, delinquency assessment techniques, and current correctional practices. A final section is devoted to the special problems of drug addiction, alcoholism, and sex offenses.—*S. Brozman*.

3655. **Wilson, Gordon Gilbert.** (U. Denver) Relationships among three measured levels of self-assessment, fantasy, coping activity and their relationships to ratings of real-life behavior. *Dissert. Abstr.*, 1961, 22(3), 921.—*Abstract*.

3656. **Yaker, Henri M.** (206 S. 4, Highland Park, N. J.) The Black Muslim in the correctional institution. *Welf. Reporter, Trenton*, 1962, 13, 158-165.—Following a historical review of the Black Muslim movement, its psychological significance and particular appeal to assaultive Negro offenders, the author reports on 2-year exploratory observations at the New Jersey State Prison. Following Weber's typology, Muslim and non-Muslim Negro and white armed robbery offenders were compared on a battery of projective and nonprojective tests. Findings for all 3 groups reflected weak psychosexual defenses, pathological hostility against women, and a need to aggressively deny homosexual impulses. For the Black Muslim, projection of the devil unto human form seemed to serve as a defense against unconscious, latent homosexual drives.—*H. P. David*.

3657. **Zenchelsky, Miriam.** (Rutgers U.) Cognition and fantasy in juvenile delinquency. *Dissert. Abstr.*, 1961, 22(5), 1719-1720.—*Abstract*.

PSYCHOSES

3658. **Azima, H., Lemieux, M., & Azima, Fern J.** *Isolement sensoriel: Étude psychopathologique et psychanalytique de la regression et du schema corporel*. [Sensory isolation: A psychopathological and psychoanalytical study of regression and physique.] *Evolut. psychiat.*, 1962, 27(2), 259-280.—A group of 18 psychotics and neurotics were given sensory deprivation experimentally for an average of 4 days. Changes were as follows: "Psychopathological changes characterized by alteration of body scheme in ten patients, positive hallucinosis in seven, negative hallucinosis in three, and some regressive behavior was evident in all patients. This latter consisted in primary delusional experiences in three pa-

tients, emergence of anal and oral behavior in seven and marked disinhibition particularly of aggressive drives in seven patients." (37-item bibliogr.)—L. A. Ostlund.

3659. Brodsky, Marvin Jerome. (U. Texas) Interpersonal stimuli as interference in a sorting task. *Dissert. Abstr.*, 1961, 22(6), 2068.—*Abstract.*

3660. Dinoff, M., Horner, R. F., Kurpiewski, B. S., Richard, H. C., & Timmons, E. O. (VA Hosp., Tuscaloosa, Ala.) Conditioning verbal behavior of a psychiatric population in group therapy-like situation. *J. clin. Psychol.*, 1960, 16(4), 371-372.—12 male hospitalized veterans described as schizophrenics between the ages 34-64, with a median age of 41, were divided into 2 matched groups of 6 Ss each. In the 1st group the P (personal) response and in the 2nd group the G (group) responses were reinforced. After each session the E left the room and the Ss were instructed to continue their discussion for another 50 min. These discussions were observed and behavior recorded by 2 judges. "Significant gains were obtained in both categories during conditioning, although the effect failed to generalize to any marked degree to another situation."—V. J. Bieliauskas.

3661. Dixon, N. F., & Lear, T. E. (University Coll., London, England) Perceptual regulation and mental disorder. *J. ment. Sci.*, 1962, 108(Whole No. 454), 356-361.—Perceptual input of neutral and of emotional-loaded words was regulated differently by normals and by schizophrenics and depressives. It is suggested that there is both a voluntary means of control, such as focusing attention, averting the eyes, turning the head away, and an automatic means of control on both input and output without awareness of the S.—W. H. Wilkins.

3662. Flinn, Don E. (Brooks AFB, Tex.) Transient psychotic reactions during travel. *Amer. J. Psychiat.*, 1962, 119(2), 173-174.—22 cases of transient psychoses termed travel syndrome are discussed as they occurred in the military setting during travel under somewhat "isolated" conditions among strangers, with the usual inactivity, monotony, unaccustomed surroundings, presence of strangers and absence of accustomed social relationships.—N. H. Pronko.

3663. McCarter, Robert Earl. (Princeton U.) Affective components of early recollections. *Dissert. Abstr.*, 1961, 22(6), 2090.—*Abstract.*

3664. Schwartz, D. A. (Mental Health Service, Los Angeles, Calif.) Paradoxical remission of psychosis. *Arch. gen. Psychiat.*, 1962, 6(4), 315-319.—3 cases are reported in which combined somato and psychotherapy showed no effect and had to be abandoned to the distress of the therapist and staff. Remission began immediately and continued over follow-up period. Speculative explanations of the phenomenon are the patients' reaction to the staff's ceasing to "try to make them get well," to the "shift from hope to hopelessness in the professional interpersonal environment" and a show of omnipotence by recovering without assistance.—L. W. Brandt.

3665. Shapiro, M. B., Slater, P., & Campbell, D. (Inst. Psychiat., London, England) The effects of distraction on psychomotor slowness in co-operative, depressed, and schizophrenic subjects. *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 121-126.—De-

pressed, schizophrenic, and normal Ss were given the Porteus Maze test under ordinary and "distraction" conditions. "Distraction had a significant effect in speeding up the starting times for all three groups; it affected the tracing times of the depressed and schizophrenic subjects similarly, but did not affect the normal subjects' tracing times. It is concluded that the outcomes of distraction experiments seem to be a function of the nature of the conditions, the distractions and the tasks involved, and that systematic further investigations of the effects of these factors is necessary before precise theory-making can become possible."—C. M. Franks.

3666. Vox, C. A. L'enuresi e il suo valore medico-sociale. [Enuresis and its medical and social significance.] *Difesa soc.*, 1962, 41(1), 93-111.—A review of the most recent literature has shown that enuresis can be considered as a reactive psychosis against familial or societal (in the case of soldiers) deprivations and frustrations.—L. L'Abate.

3667. Wadsworth, W. V., Wells, B. W. P., & Scott, R. F. (Cheadle Royal Hosp., Cheshire, England) A comparative study of the fatigability of a group of chronic schizophrenics and a group of hospitalized non-psychotic depressives. *J. ment. Sci.*, 1962, 108(Whole No. 454), 304-308.—6 schizophrenics and 5 depressives are compared on a hat construction test. Modification of work patterns may be necessary so that type of task is appropriate for the patient. When output is closely checked the schizophrenics do as well as the depressives but fall off more when supervision ceases. It is suggested that schizophrenics' work efficiency may depend upon conditions that help pace them and provide environmental cues as to performance—this helps to offset the supposed breakdown of the internal reality principle.—W. L. Wilkins.

Schizophrenia

3668. Ayllon, T., & Haughton, E. (Saskatchewan Hosp.) Control of the behavior of schizophrenic patients by food. *J. exp. Anal. Behav.*, 1962, 5(3), 343-352.—In order to use food as a reinforcer for controlling psychotic behavior, certain eating problems had to be investigated first. Approximately 50% of the ward population had a history of refusal to eat. Neither physical treatments nor social reinforcement, in terms of coaxing or persuading, worked. Moreover, the latter tended to condition patients to eat only with assistance. When refusal to eat was no longer followed by social reinforcement the patients soon started eating unassisted. When access to the dining room was made dependent upon a chain of responses, including a motor and social component, all patients learned these responses.—J. Arbib.

3669. Biran, S. Richteges und falsches am ätiologischen Konzept der Schizophrenie als einer Erlebnisreaktion. [True and false in the concept of schizophrenia as an experience reaction.] *Acta psychother. psychosom.*, Basel, 1962, 10(1), 26-44.—Intrafamilial trauma as a cause of schizophrenia is only a partial explanation. To the preparatory repression-creating causes and the direction-giving causes which enforce pathological functions of neurosis, the author adds a 3rd group to schizophrenia, namely, the causes of regression, exclusively endogenous in nature. He draws a sharp line of demarca-

tion between reactions against experiences and psychological disturbances.—G. Rubin-Rabson.

3670. Block, J. (U. California, Berkeley) A perspective on the MacAndrew-Geertsma reanalysis. *J. clin. Psychol.*, 1961, 17(1), 88-90.—This paper presents a response to an article by MacAndrew and Geertsma (see 37: 3700) and their criticisms of a paper by Jackson, Block, Block, and Patterson (see 33: 8787). The differences between oblique and orthogonal rotations and the methodological differences in both approaches are pointed out. Also the semantic differences in describing the schizophrenogenic mothers were compared and their militantly high degree of agreement was pointed out.—V. J. Bieliauskas.

3673. Chapman, James, & McGhie, Andrew. (U. St. Andrews, Scotland) A comparative study of disordered attention in schizophrenia. *J. ment. Sci.*, 1962, 108 (Whole No. 455), 487-500.—On 5 different tests of attention, schizophrenics could be distinguished from nonschizophrenic patients and from normals. Hebephrenics performed at a significantly low level.—W. L. Wilkins.

3674. Clarke, Alan Rogers. (Duke U.) Conformity behavior of schizophrenic subjects to maternal figures. *Dissert. Abstr.*, 1962, 22(12), 4404-4405.—Abstract.

3675. Cowden, R. C., & Ford, L. I. (VA Hosp., Pittsburgh, Pa.) Systematic desensitization with phobic schizophrenics. *Amer. J. Psychiat.*, 1962, 119(3), 241-245.—2 illustrative cases are presented of schizophrenic patients with phobic reactions that yielded to gradual, systematic desensitization, a therapeutic technique recommended "for some schizophrenic subjects."—N. H. Pronko.

3676. Culver, Charles Marriott. (Duke U.) The effect of cue value on size estimation in schizophrenic subjects. *Dissert. Abstr.*, 1962, 22(12), 4405.—Abstract.

3677. Delay, J., Deniker, P., & Green, A. Le milieu familial des schizophrènes: III. Résultats et hypothèses. [The family milieu of schizophrenics: III. Results and hypotheses.] *Encephale*, 1962, 51(1), 5-73.—Clinical findings and family backgrounds of 50 schizophrenics are discussed and detailed histories of 15 patients are presented. Genetic, phenomenological, and psychoanalytic approaches to the etiology of schizophrenia are evaluated. The study focuses on the influence of the parental role in the social environment of the patient's family. The following conclusions are drawn: (a) the characteristics of the family milieu should be considered in diagnosis; (b) therapy should include the parents as well as the patient, either individually or in a group, and its objective should be "autonomisation" of the patient by disengaging him from encumbering fixations and identifications; and (c) the problem is raised, in regard to prognosis, of the manner of separation from the patient's natural milieu. (53 ref.)—W. W. Meissner.

3678. de Simone, G. (U. Lausanne) La catatonie pernicieuse: Existe-t-elle encore? [Does pernicious catatonia still exist?] *Encephale*, 1962, 41(1), 74-83.—The history of the syndrome is reviewed and 4 cases presented. Conclusions: (a) the percentage of catatonia issuing in death is very small, (b) the cases presented all showed pathological lesions from independent factors, (c) the progressive decrease in frequency suggests that pernicious catatonia should not be distinguished from other catatonias and that fatalities have been due to other undiagnosed factors. (31 ref.)—W. W. Meissner.

3680. Dinoff, M., Horner, R. F., Kurpieyski, B. S., & Timmons, E. O. (VA Hosp., Tuscaloosa, Ala.) Conditioning verbal behavior of schizophrenics in a group therapy-like situation. *J. clin. Psychol.*, 1960, 16(4), 367-370.—10 male hospitalized chronic schizophrenic patients with the mean age of 39.5 years were divided into 2 matched groups of 5 Ss each. The 1st group was seen for 6 50 min. sessions whereby the examiner attempted to elicit with questions and reinforce by his approval the P (personal) responses 5 times from each S each hour. Group II was similarly treated, but with the reinforcement of G (group) responses "using a newly developed, easily scored and highly reliable scoring system, individual responses were established in a group situation with a schizophrenic population." Although the effect of the verbal conditioning did not show a long lasting change in verbal behavior of the patients, it appeared that the experimental procedure suggested a brief but significant change in a group situation with schizophrenics.—V. J. Bieliauskas.

3681. Farahmand, Saied Shamlu. (Washington State U.) Personality characteristics and child-rearing attitudes of fathers of schizophrenic patients. *Dissert. Abstr.*, 1961, 22(4), 1250.—Abstract.

3682. Feldstein, S. (Teachers Coll., Columbia U.) The relationship of interpersonal involvement and affectiveness of content to the verbal communication of schizophrenic patients. *J. abnorm. soc. Psychol.*, 1962, 64(1), 39-45.—To analyze the effect of close interpersonal contact on the communication process of schizophrenics, 30 hospitalized male schizophrenics were asked to associate to TAT-like cards under 2 conditions of E-involvement. The condition of close personal contact was where E interviewed S directly, made use of personal pronouns, and attempted to promote a relatively close relationship; the condition of remote personal contact was where S received nonpersonalized instructions from a tape recorder operated by E. As compared to 30 hospitalized medical patients, content of speech of the schizophrenic patients was indistinguishable from controls except for irrelevancies. Degree of personal contact did not seem to affect S's communication.—G. Frank.

3683. Felice, Antonio. (Temple U.) Some effects of subject-examiner interaction on the task performance of schizophrenics. *Dissert. Abstr.*, 1961, 22(3), 913.—Abstract.

3684. Ferster, C. B., & DeMyer, Marian K. A method for the experimental analysis of the be-

havior of autistic children. *Amer. J. Orthopsychiat.*, 1962, 32(1), 89-98.—The behavior repertoires of 3 autistic children were widened significantly in an experimental room using the techniques of operant reinforcement. It may be possible that the same potential for behavioral change would exist in the social milieu if the proper conditions could be generated.—R. E. Perl.

3685. Foulds, G. A., Dixon, Penelope; McClelland, Marilyn, & McClelland, W. J. (Runwell Hosp., Wickford, Essex) The nature of intellectual deficit in schizophrenia: II. A cross-sectional study of paranoid, catatonic, hebephrenic and simple schizophrenics. *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 141-149.—"Progressive Matrices (1938) and Mill Hill Vocabulary scores of 270 schizophrenics were analysed in relation to sex, length of hospitalization, age and diagnostic subgroup. Men were significantly superior to women in all subgroups on both tests. Hospitalization period contributed little to the results over and above its inevitable relationship with age. The negative relationship between PM scores and age was similar in schizophrenics and neurotics. This and other evidence led to the conclusion that impairment was non-progressive and largely confined to the period between the onset of the illness and first admission. Consistent differences were found between the subgroups independent of the sex difference, catatonics showing the most differential impairment of intellectual ability."—C. M. Franks.

3686. Freeman, Thomas. (Glasgow Royal Mental Hosp., Scotland) A psycho-analytic approach to the diagnosis of schizophrenic reactions. *J. ment. Sci.*, 1962, 108(Whole No. 454), 286-299.—Cognitive organization in a normal state of attention, in the dream state, and in chronic schizophrenia can be studied so that clear differentiations are possible. Ego psychology can help distinguish the features of condensation and lack of discrimination which typify the schizoid process, and the examiner must also note dedifferentiation and primitivization of concepts. Whether paranoid delusions and auditory hallucinations—other textbook features of the disease—are as crucial as cognitive disturbance is a matter for research.—W. L. Wilkins.

3687. Gilgash, C. A. (MacMurray Coll.) Thorazine therapy with catatonic schizophrenics in relation to Wechsler Verbal and Performance subtest comparison. *J. clin. Psychol.*, 1961, 17(1), 95.—2 groups of catatonic schizophrenic patients matched for age, sex, intelligence, and admission diagnosis were used in this study. The experimental group was administered a daily dose of 300 milligrams of thiorazine for 30 days and the control group was administered a placebo. When retested with the Wechsler-Bellevue Intelligence Scale the experimental group showed a marked improvement in their IQs, as compared with the control group. Noticeable differences were also found in Verbal and Performance subtest comparisons.—V. J. Bieliauskas.

3688. Goldman, A. E. (National Analysts) Symbol consensus and univocality in schizophrenia. *J. proj. Tech.*, 1962, 26(3), 288-294.—Compared with normals there is less agreement between schizophrenics on the symbolic expression of affect through linear drawings. Schizophrenics also manifest a more primitive, undifferentiated pattern of affective re-

sponse as seen in their choice of identical lines to represent opposite mood-terms.—A. Greenwald.

3689. Goldman, Arnold Robert. (Stanford U.) The effects of dependency and dependency-anxiety on schizophrenics' rate of learning under conditions of social reward and punishment. *Dissert. Abstr.*, 1961, 22(6), 2063.—Abstract.

3690. Salmon, Vernon, & Salmon, Phillida. (Springfield Hosp., London, England) Psychological changes in chronic schizophrenics following differential activity programmes. *J. ment. Sci.*, 1962, 108(Whole No. 455, 505-520.—Comparisons of outcomes from traditional occupational therapy and quasi-industrial work in a workshop was made for male long-stay nonparanoid schizophrenics of age 20-40 and checked by changes on a variety of psychological tests and clinical ratings. Behavioral changes were associated with flat rate monetary reward for work; holding absenteeism constant, output and earnings were greater for patients working as teams than for patients working individually.—W. L. Wilkins.

3691. Herron, William G. (St. Bonaventure U.) Abstract ability in the process-reactive classification of schizophrenia. *J. gen. Psychol.*, 1962, 67, 147-154.—30 process schizophrenics and 30 reactive schizophrenics were delineated according to Ego-Strength scale scores. These patients were subsequently divided into a process group of 21 and a reactive group of 21 on the basis of agreement between ES scores and psychiatric ratings. A normal control group was also used. All Ss were given tests of abstract ability and mean scores of the groups on each test were compared. The abstract ability of the process group was significantly inferior to that of the reactives and normals. A significant difference in abstract ability between reactives and normals occurred on a less consistent basis. The results suggest 2 polar constellations of schizophrenia: a process type characterized by poor prognosis and gross impairment of abstract ability, and a reactive type characterized by good prognosis and slight impairment of abstract ability.—Author abstract.

3692. Jackson, Don D. Schizophrenia. *Scient. American*, 1962, 207(2), 65-78.—The study of schizophrenia must include a study of its investigators. They have tended to gravitate toward 1 or 2 extremes: to investigation of some easily isolated and controllable aspect of the patient, or to generalized sociological observations. The largest effort has gone into the search for some neat biological explanation at the expense of broader research. The accumulating literature proves that there will be no such simple answer to schizophrenia. Evidence for the psychosocial nature of schizophrenia has been mounting for the past 10 years.—L. A. Waack.

3693. Kantor, Robert E., & Jackson, Don D. (Palo Alto Medical Research Found., Palo Alto, Calif.) Some assumptions in recent research on schizophrenia. *J. nerv. ment. Dis.*, 1962, 135(1), 36-42.—"The present paper has proposed that flourishing lines of inquiry into the nature of schizophrenia (citing family, Rorschach and mental hospital studies) have been nourished by the particular position of the social scientist—a position that adds new dimensions to the traditional psychiatric inquiries. The adoption of this particular position bypasses the study of the biology of schizophrenia but, of course, does not exclude or supersede it; in

our present state of darkness, illumination from any direction seems equally beneficial.—N. H. Pronko.

3694. King, H. E. (U. Pittsburgh School Medicine) Two-flash and flicker fusion thresholds for normal and schizophrenic subjects. *Percept. mot. Skills*, 1962, 14(3), 517-518.—The findings indicate, clearly, that critical flicker-fusion and 2-flash fusion measure separate functions, and that the interflash-interval determined with the same optical and stimulating system is decidedly different for each sample, an interflash-interval of between 2 and 3 times greater duration being required for TFF resolution than at threshold CFF. Neither test served to distinguish normal from schizophrenic performance.—W. H. Guertin.

3695. Knehr, Charles A. (Payne Whitney Psychiatric Clinic) Psychological assessment of differential impairment in cerebral organic conditions and in schizophrenics. *J. Psychol.*, 1962, 54(1), 165-189.—A comparison of the performances of acute schizophrenics, organics, and controls on a battery of 10 tests indicates that tests of abstract intellectual ability tend to be most sensitive to both psychopathological thinking impairment and organic changes and are therefore the least likely to differentiate organic factors from functional. Impaired performances, when observed on several other tests with negligible factor loadings on g functions, indicate the presence of cerebral dysfunction with a minimal number of false positives.—Author abstract.

3696. Lerner, Mildred Sherwood. (New York U.) The relationship of certain aspects of the body image of female schizophrenic patients to therapeutic success or failure. *Dissert. Abstr.*, 1962, 22(12), 4408-4409.—Abstract.

3697. Losen, Stuart M. (U. Buffalo) The differential effects of censure on the problem-solving behavior of schizophrenic and normal subjects. *J. Pers.*, 1961, 29(3), 258-272.—"Methods . . . were designed to direct attention to the task and thus produce performance increment by mildly censuring Ss' incorrect responses. . . . In agreement with expectation, no significant increment or decrement was obtained . . . with any of the normal groups on either the arithmetical reasoning, or digit-span tasks." However, the major hypothesis, that censure would effect an increment in the performance of "good pre-morbid" schizophrenics, was confirmed.—G. T. Lodge.

3698. Lu, Yi-Chuang. (Manteno State Hosp., Ill.) Contradictory parental expectations in schizophrenia: Dependence and responsibility. *Arch. gen. Psychiat.*, 1962, 6(3), 219-234.—Preliminary findings from intensive interviews with 50 chronic schizophrenics with nonschizophrenic siblings, (preferably under 35, white, grade school educated, and of lower class) and from similar interviews with the patient's parents, siblings, and significant others indicate "(1) contradictory parental expectations regarding dependence and independence . . . coupled with the preschizophrenic child's persistent efforts in compliance with both expectations; (2) certain experiences at birth or during infancy that incline both the parents and the preschizophrenic child to interact in the contradictory ways as described; and (3) certain sociocultural situations which heighten to the critical point the dilemma" contribute to the development of

schizophrenia in this sample. (21 ref.)—L. W. Brandt.

3699. Ludwig, Arnold M., Wood, Benjamin S., Jr., & Downs, Marion P. (U. Colorado Medical Cent., Denver) Auditory studies in schizophrenia. *Amer. J. Psychiat.*, 1962, 119(2), 122-127.—A pilot study with 54 schizophrenics and 54 control Ss utilizing 5 audiometric tests showed no differences on the pure tone and speech reception thresholds. Schizophrenics did show "more abnormalities than controls on the tone decay, delayed auditory feedback and signal-to-noise ratio tests."—N. H. Pronko.

3700. MacAndrew, C., & Geertsma, R. H. (U. California, Los Angeles, School Medicine) A reanalysis of "Psychiatrists' Conceptions of the Schizophrenogenic Parent." *J. clin. Psychol.*, 1961, 17(1), 82-87.—Q-sort descriptions of the images of the schizophrenic mother given by 20 experienced psychiatrists as reported by Jackson, Block, Block, and Patterson (see 33: 8787) were reanalyzed. "Three conceptualizations of the schizophrenogenic mother were obtained from the reanalysis: (1) the 'hostile, rejecting mother' whose excessive guilt and general insecurity result in a pervasive emotional isolation from others. (2) the 'unbending mother' whose rigid superego controls and lack of flexibility may be viewed as reflecting a form of neurotic strength of character. (3) the 'fearful, inadequate mother' whose excessive guilt and insecurity are handled by a flight into anonymity and conventionality, resulting in a near-total suppression of all self-expression." These findings suggested significant differences between this study and the original study.—V. J. Bieliauskas.

3702. Marx, Alfred. (U. Oklahoma) The effect of interpersonal content on conceptual task performance on schizophrenics. *Dissert. Abstr.*, 1962, 22(12), 4410.—Abstract.

3703. May, A. R., & Robertson, J. P. S. (Warrington Park Hosp., Surrey, England) The efficacy of habit training in chronic schizophrenia. *J. clin. Psychol.*, 1960, 16(4), 359-361.—The "habit training" technique used in Great Britain, aimed at the rehabilitation of severely disorganized schizophrenics which is equivalent to Myerson's "total push" technique, was examined on an experimental group of 10 patients with a matched control group. The patients in the control group were presented with a varied program of social activities and entertainment. Patients in the experimental group were given special rewards for doing well in any respect, while patients in the control group did not receive any rewards. "The results indicated that the habit training of chronic schizophrenics does not produce changes for the better in general alertness, practical efficiency, or social adaptability; but does produce an improvement of care in personal appearance which is sufficiently firm to survive 48 hrs. without aid or stimulation from nurses."—V. J. Bieliauskas.

3704. Mersky, H., Gillis, A., & Marszalek, K. S. (U. Sheffield) A clinical investigation of reactions to pain. *J. ment. Sci.*, 1962, 108(Whole No. 454), 347-355.—Both hyperactive and hypoactive patients on a ward scored higher than normally active pa-

tients on tests with a pressure algometer. Paranoid patients reacted somewhat less than normals. Assuming inability to respond to stimulation from lack of activity on the ward is a mistake with schizophrenic patients.—*W. L. Wilkins.*

3705. Muira, T. (U. Keio, Tokyo, Japan) *Le syndrome schizophrénique et la maladie schizophrénie, envisagés dans la psychiatrie japonaise.* [The schizophrenic syndrome and schizophrenia in Japanese psychiatry.] *Encephale*, 1961, 50(5), 471-477.—Japanese psychiatric thinking about schizophrenia reflects the dominant influence of German thought, particularly of Jaspers and Schneider. The influence of American dynamic psychiatry has noticeably increased in recent years. Current points of discussion relative to the understanding of schizophrenia in Japanese circles are sketched.—*W. W. Meissner.*

3706. Pontius, A. A. (Worcester State Hosp.) *Role of hallucinatory experiences of rhythmical movements during ego re-integration in a schizophrenic man.* *Percept. mot. Skills*, 1962, 14(3), 439-473.—A detailed account of schizophrenic hallucinations of movements is given and discussed in regard to the re-integration of various ego functions as well as some aspects of the body schema. Hypothesized is a role probably played in this integration process by patterns of rhythmical movement experiences which are related primarily to the activities of the autonomic nervous system. (78-item bibliogr.)—*W. H. Guertin.*

3707. Reisman, Marvin Norman. (U. Buffalo) *Size constancy in schizophrenics and normals.* *Dissert. Abstr.*, 1961, 22(4), 1261.—*Abstract.*

3708. Roos, Philip, & Lewis, Jerry M. (Psychological Services, Austin, Tex.) *Differential abstraction deficits in a normal population.* *J. nerv. ment. Dis.*, 1962, 134(6), 535-538.—"The ability to abstract proverbs of oral, anal, phallic and nonsexual content was studied in 167 university students. The results were highly similar to those reported by Lewis for schizophrenics. No sex differences were found, but performance on the proverbs test was significantly related to intelligence as measured by the Otis Higher Examination. The findings raise serious doubts regarding earlier conclusions that schizophrenics are distinguished from normals by a differential abstraction deficit related to psychosexual content of proverbs."—*N. H. Pronko.*

3709. Scarinci, Adele. *Betrachtungen über einige psychopathologische Züge der beginnenden Schizophrenie.* [Psychopathological features of incipient schizophrenia.] *Acta paedopsychiat.*, Basel, 1962, 29(3), 65-76.—Incipient schizophrenia in 13-21 year old patients is manifest in slowly developing symptoms: weakening of ties to the outer world, to parents and friends, progressive self-isolation, concern with own bodily structures. No symptom alone is conclusive; taken together, the diagnosis is probably schizophrenia. Individual symptoms may previously have been treated on a neurasthenic, hysterical or obsessive-neurotic basis.—*G. Rubin-Rabson.*

3710. Schnore, Morris M. *Re-evaluation of an activity treatment programme with regressed schizophrenic patients.* *Canad. Psychiat. Ass. J.*, 1961, 6(3), 158-162.—This study was a further evaluation of an activity treatment program with 14

severely regressed male schizophrenic patients. A comparison with a control group revealed that a 2-year participation in the program produced improved intellectual functioning, a decrease in schizophrenic symptoms, and a consequent improvement in hospital adjustment. The findings have been interpreted as supporting the thesis that the progressive regression and deterioration often observed in long standing cases of schizophrenia might be largely due to the relative lack of social and physical stimulation.—*Author abstract.*

3711. Sen, M. N., & Sunderaraj, N. *Statistical studies on hospitalized mental patients. Part IV.* *Trans. All-India Inst. Ment. Hlth.*, 1960, 1, 39-43.—The analyses of symptom patterns in schizophrenia indicate: auditory and visual hallucinations and delusions of persecution and grandeur seem to occur more frequently in the early stages of illness (less than 6 months); fluctuation of attention is more marked in the early stages than in the later stages; impairment of intellect and memory, anxiety, depression, suspiciousness, and disharmony show a tendency to increase with longer duration of illness; and anxiety, orientation, insight, and judgment are more frequent in the acute onset, while delusion of persecution and suspiciousness are slightly more frequent in insidious onset. The intercorrelation matrix of 18 symptoms is presented, which shows the possible presence of a common factor underlying the cognitive functions.—*U. Pareek.*

3712. Silverman, L. N., Lapkin, B., & Rosenbaum, I. S. (U. Pennsylvania) *Manifestations of primary process thinking in schizophrenia.* *J. proj. Tech.*, 1962, 26(1), 117-127.—Global assessment of thinking disturbance successfully differentiated between schizophrenic and nonschizophrenic Rorschachs. Primary process thinking was manifested to a significantly greater degree in the Rorschachs of schizophrenics.—*A. F. Greenwald.*

3713. Smock, Charles D., & Vancini, John. (Purdue U.) *Dissipation rate of the effects of social censure in schizophrenics.* *Psychol. Rep.*, 1962, 10(2), 531-536.—"Thirty schizophrenics and 30 controls learned appropriate motor responses to each of 14 nouns under Reward (15 Ss) and Social Censure (15 Ss) conditions to a criterion of 10/14 correct. After a 2-min. rest period, each S relearned the list to one perfect trial. Schizophrenics required more trials to reach the original criterion and those in the censure group had significantly less reminiscence. The slower rate of dissipation of interfering response in the schizophrenic-censure group lends support to Mednick's reciprocal augmentation theory."—*B. J. House.*

3714. Wadsworth, W. V., Scott, R. F., & Wells, B. W. P. (Cheshire Royal Hosp., Cheshire, England) *The employability of chronic schizophrenics.* *J. ment. Sci.*, 1962, 108(Whole No. 454), 300-303.—In a comparative situation, 12 patients, of average hospital stay of 17 years, produced 34% as much as 12 normal workers. If a sheltered factory employing patients each of whom produced 1/3 as much as an ordinary worker is assessed on a straight cost basis the productivity of the workers might well be sufficient to pay nearly all costs, even most of the cost of charge nurses who would have to supervise the patients in any situation.—*W. L. Wilkins.*

3715. Wadsworth, W. V., Wells, B. W. P., & Scott, R. F. (Cheshire Royal Hosp., Cheshire, England) A comparative study of chronic schizophrenics and normal subjects on a work task involving sequential operations. *J. ment. Sci.*, 1962, 108(Whole No. 454), 309-316.—Normals show decrements in both speed and accuracy as task complexity increases; schizophrenics tend to maintain speed but have a considerable loss in accuracy. Semi-complex psychomotor tasks which involve attention and distractibility are difficult for schizophrenics who are liable to work uncritically. Work tasks for psychotics must be kept simple—with very few choices to be made.—*W. L. Wilkins.*

3716. Webster, Frances R., Goldstone, Sanford, & Webb, Warren W. (Houston State Psychiatric Inst.) Time judgment and schizophrenia: Psychophysical method as a relevant contextual factor. *J. Psychol.*, 1962, 54(1), 159-164.—Previous findings of greater overestimation of short auditory durations with a method of limits procedure by schizophrenic Ss were reexamined with the method of constant stimuli. Healthy, schizophrenic, other psychiatric, and physically disabled Ss judged auditory inputs as more or less than their concept of one clock second along a 9 point category scale. The fixed, predetermined constant method did not produce the patient control differences obtained with the more instrumental method of limits. Schizophrenic Ss used fewer judgment categories but this appeared more a function of severity of illness and presence or absence of psychopathology than of the illness schizophrenia. The results are discussed in terms of the implications of contextual and population factors in the study of psychopathology.—*Author abstract.*

3717. Weiner, Irving B. (U. Rochester School Medicine & Dentistry) Three Rorschach scores indicative of schizophrenia. *J. consult. Psychol.*, 1961, 25(5), 436-439.—3 Rorschach signs—1 or 2 CF, Sum C between 1.5 and 3.0, and C or CF without C—are significantly discriminating in 3 studies and recommended for inclusion among criteria for schizophrenia.—*E. R. Oetting.*

3718. Wright, David J., Goldstone, Sanford, & Boardman, William K. (Baylor U. Coll. Medicine) Time judgment and schizophrenia: Step interval as a relevant contextual factor. *J. Psychol.*, 1962, 54(1), 33-38.—Previous findings of greater overestimation of short auditory durations by schizophrenic Ss were reexamined by studying the differential effect of an arithmetic and a geometric stimulus series. Although patients and controls differed with the arithmetic series as before, this difference disappeared with the geometric step interval. These results were considered in light of possible intra-serial anchor effects.—*Author abstract.*

3719. Zlotowski, Martin. (Michigan State U.) The uniqueness, novelty, complexity, and variability of response in process and reactive schizophrenics. *Dissert. Abstr.*, 1962, 22(12), 4416-4417.—*Abstract.*

Affective Disorders

3720. Adams, Anne, & Foulds, G. A. (Runwell Hosp., Wickford, Essex, England) Depression and personality. *J. ment. Sci.*, 1962, 108(Whole No. 455), 474-486.—17 psychotic and 20 neurotic depressive women were administered a battery which in-

cluded personality inventory type items and diagnostic items. The patients who improved changed on diagnostic test classifications but not on personality measures. Implications for classification are drawn from the greater stability of personality measures.—*W. L. Wilkins.*

3724. Martin, Irene, & Davies, Brian M. (Inst. Psychiatry, U. London, England) Sleep thresholds in depression. *J. ment. Sci.*, 1962, 108(Whole No. 455), 466-473.—Intravenous sodium amytal sleep thresholds for 30 depressed patients and 12 normals show no differences between varieties of depressed patients nor normals. Personality inventory scores were higher, on neuroticism and anxiety, for the patients, but these scores were not related to the sleep threshold data.—*W. L. Wilkins.*

3725. Ryle, Anthony, & Hamilton, Madge. (25 Caversham Rd., London, England) Neurosis in fifty married couples assessed from general practice records, interviews by a psychiatric social worker and the use of the Cornell Medical Index. *J. ment. Sci.*, 1962, 108(Whole No. 454), 265-273.—Thorough examination by the general practitioner reveals psychiatric diagnosis in 52 of the 100 Ss, most of these being reactive anxiety or depression. High scores on the medical index corroborate these diagnoses as only 4 false positives were noted. Minor common neurotic illnesses seem definitely related to poor achievement in economic, social, and interpersonal spheres.—*W. L. Wilkins.*

3726. Shapiro, M. B., Neufeld, I. L., & Post, F. (Maudsley Hosp., London, England) Note: Ex-

perimental study of depressive illness. *Psychol. Rep.*, 1962, 10(2), 590.—A report of therapeutic results obtained by systematically applying 2 different therapy methods to a depressed, phobic patient, with measurements taken 4 times weekly.—B. J. House.

3727. Tellenbach, H. (Heidelberg, Germany) *Gestalten der Melancholie*. [Gestalts of depression.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 9-26.—The concept "Gestalt" is used here in a twofold meaning, existential gestalt and essential gestalt. The theoretical differences of both usages of "Gestalt" is discussed in terms of existential philosophy and psychiatry. Endogene and reactive types of depression which are recognized as being individual in type by clinicians are evaluated theoretically in the light of speculations of some authors. Particular attention is given to Kierkegaard's and Nietzsche's approaches. Religious and literary implications of depression, as they are encountered in the Western Hemisphere, are also presented.—V. J. Bieliauskas.

Physiological Correlates

3728. Bishop, Melvin Puckett. (Vanderbilt U.) *Psychotoxic effects of schizophrenic plasma in the rat*. *Dissert. Abstr.*, 1961, 22(4), 1247.—Abstract.

3729. Bogoch, Samuel; Belval, Peter C., Dussik, Karl T., & Conran, Peter C. (Harvard Medical School, Boston) *Psychological and biochemical syntheses occurring during recovery from psychosis*. *Amer. J. Psychiat.*, 1962, 119(2), 128-135.—A neurochemical and clinical double-blind method was applied to 33 cases added to a previously-studied 24 cases of psychotic states. Changes in the cerebrospinal fluid were found to be related to "psychological and behavioral changes respectively occurring during entry into and recovery from psychotic states."—N. H. Pronko.

3730. Brune, Guenter G., & Himwich, Harold E. (Galesburg State Research Hosp., Ill.) *Indole metabolites in schizophrenic patients: Urinary excretion*. *Arch. gen. Psychiat.*, 1962, 6(4), 324-328.—"Longitudinal studies of the urinary excretions of tryptamine and total indole-3-acetic acid as well as of behavior . . . of 20 male schizophrenic patients" showed a correlation between the excretions studied and "the degree of psychotic activity."—L. W. Brandt.

3731. Oken, Donald; Grinker, Roy R., Heath, Helen A., Herz, Marvin; Korchin, Sheldon J., Sabshin, Melvin, & Schwartz, Neena B. (Michael Reese Hosp., Chicago, Ill.) *Relation of physiological response to affect expression: Including studies of autonomic response specificity*. *Arch. gen. Psychiat.*, 1962, 6(5), 336-351.—2 groups each of 9 high and low affective lability, range, and threshold, normal college students showed no significant difference on 9 physiological variables and 3 affective and 3 defensive psychiatric response categories in a psychological stress, a physical stress, and a control situation. "The hypothesis that the affectively less expressive subjects would manifest greater physiological responses generally was not substantiated." Small differences between the groups appeared in GSR, diastolic blood pressure, finger blood flow, and finger-skin temperature. (22 ref.)—L. W. Brandt.

3732. Ray, Thomas Shelby. (U. Oklahoma) *Electrodermal indications of levels of psycholog-*

ical disturbance in chronic schizophrenia. *Dissert. Abstr.*, 1961, 22(4), 1260.—Abstract.

3733. Shagass, Charles, & Schwartz, Marvin. (State U. Iowa) *Cerebral cortical reactivity in psychotic depression*. *Arch. gen. Psychiat.*, 1962, 6(3), 235-242.—1 male and 15 female patients aged 23-68 were tested by photographic averager for cortical potentials evoked. "Reactivity cycles . . . showed progressively more early response recovery as the depression improved, and diminished recovery with relapse, indicating that abnormal cortical reactivity in psychotic depression is reversible."—L. W. Brandt.

3734. Shagass, Charles, & Schwartz, Marvin. (State U., Iowa) *Observations on somatosensory cortical reactivity in personality disorders*. *J. nerv. ment. Dis.*, 1962, 135(1), 44-51.—"The aim of this study was to bring a new kind of physiological data to bear on the question: Are personality disorders more like psychoneuroses or more like psychoses? Potentials evoked at the somatosensory cortex by stimulation of the ulnar nerve were recorded from scalp leads by means of an averager. Pairs of stimuli, separated by varying intervals, were used to determine the first 190 msec. of the somatosensory recovery cycle, which describes the temporal course of changes in responsiveness subsequent to a stimulus. Recovery cycles in 36 patients with personality disorders were compared with those in 25 nonpatients, 34 psychoneurotics and 21 schizophrenic patients. The aspect of the recovery cycle which differentiated best between subject groups was the peak amount of recovery achieved in the first 20 msec. after the stimulus. With respect to this index, the personality disorders and schizophrenics were clearly distinguishable from psychoneurotic and non-patient subjects, but undistinguishable from one another. No statistically significant differences between types of personality disorder were found. It was concluded that the results favor the view which places the personality disorders closer to the psychoses than to the psychoneuroses."—N. H. Pronko.

3735. Ueno, Yôzô; Aoki, Norita; Yabuki, Tensi, & Kuraishi, Fumio. (Nihon U.) *Electrolyte metabolism in blood and cerebrospinal fluid in psychoses*. *Folia psychiat. neurol. Jap.*, 1961, 15(4), 304-326.—Na⁺, K⁺, Ca⁺⁺, and Cl⁻ content of blood and CSF were measured in several hundred patients, mostly schizophrenics. The most reliable differences were noted in the K⁺ level in the CSF, which was high in schizophrenics, and decreased during periods of improvement. It is suggested that the added potassium comes directly from the brain into the CSF, and the role of potassium and other electrolytes in brain metabolism is discussed.—W. A. Wilson, Jr.

3736. Whatmore, George B., & Ellis, Richard M. (Seattle, Wash.) *Further neurophysiologic aspects of depressed states: An electromyographic study*. *Arch. gen. Psychiat.*, 1962, 6(3), 243-253.—"The findings indicate that patients exhibiting severe recurrent depressions of the retarded type are hyperpericentric during periods of recovery and in apparent excellent health prior to relapse." (28 ref.)—L. W. Brandt.

PSYCHONEUROSES

3737. Delay, J., Klotz, H. P., Pichot, P., Weil, F., & Perse, J. (Hôpital Ste.-Anne, Paris) *Tétanie et hystérie*. [Tetany and hysteria.] *Encephale*, 1961, 50(5), 437-449.—The connection between the

symptoms of chronic constitutional tetany and hysteria were examined in 4 clinical cases. Also the MMPI was administered to 3 groups: 20 women with symptoms of chronic tetany, 20 women diagnosed as hysterics, and 18 women with conversion symptoms together with diagnoses of hysterical character. Profiles were similar for all groups (elevation of neurotic and psychotic triads, depression of Mf scale), but deviations in the hysterical groups were greater. The hypothesis is presented that both hysterical and tetany reactions originate from a certain type of dysfunction in subcortical centers.—*W. W. Meissner.*

3738. **Dmitriev, A. F., & Pervov, L. G.** (Pavlov Inst. Physiology, USSR Acad. Sciences, Leningrad) *Issledovanie sootnosheniia signal'nykh sistem pri nevrozakh.* [Relationship between signaling systems in neuroses.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 979-984.—Ss were 92 neurotics, 35 hysterics, and 57 neurasthenics (32 hyper- and 20 hyposthenics). They were asked to react verbally to presentation of objects and their names. Pervov's method of collision of verbal and direct stimuli was used. It was found that responses of neurasthenics tended to follow verbal stimuli whereas those of hysterics were more affected by direct stimuli of objects. As all patients improved, the number of responses of the 2nd signaling order increased.—*A. Cuk.*

3739. **Göppert, H.** (Freiburg, Germany) *Zur Psychopathologie der Zwangskrankheit.* [On the psychopathology of obsessive-compulsive illness.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 38-47.—It is suggested that a person with obsessive-compulsive behavior features experiences a "fundamental depersonalization" which is quite different from the phenomenon of depersonalization experienced in depression. The obsessive-compulsive diseases are connected with the experience of complete loss of personalization to other people. A person inflicted with such a disease refuses to accept the fact that he can be understood by another person and attempts to reduce his behavior to numbers and other quantitative formulae. In view of these ideas new approaches for psychotherapy are suggested.—*V. J. Bieliauskas.*

3740. **Iwamoto, Shin-ichi.** (Kobe Medical School, Japan) *Zur Psychopathologie des amnestischen Syndroms.* [The psychopathology of the amnesia syndrome.] *Folia psychiat. neurol. Jap.*, 1961, 15(3), 218-228.—The performance of 7 amnesic patients upon tests of memory and perception is summarized. It is concluded that the memory loss in amnesia is only one aspect of a general disturbance in the integration of psychological functions.—*W. A. Wilson, Jr.*

3741. **Jores, A.** (II Medizinische Universitäts-Clinic & Poliklinik Hamburg-Eppendorff, Germany) *Über die erfolgreiche Behandlung eines Falles von Herzphobie.* [On the successful treatment of a case of cardiophobia.] *Z. psycho-som. Med.*, 1961, 7(4), 249-254.—A 46-year-old male who missed safety, tranquility, and acceptance in his childhood developed a fear of heart disease. This fear was based on a hidden desire to receive love, security, and care—primarily from his wife. Lack of security, of self-reliant development of one's potentialities, and suppressed not-experienced aggressivity are the 3 main roots of anxiety. Cure in 40 sessions was brought about by good transference based on frank discussions

of the threats in the external world, of safety in emotional life and faith, and reference to the curative effect of satisfying activity.—*I. Neufeld.*

3742. **Pollock, George H.** (U. Illinois) *Transference neurosis.* *Arch. gen. Psychiat.*, 1962, 6(4), 294-306.—"A review of Georg Simmel's concepts is included and correlated with the modifications that occur in the course of the developing transference neurosis. Viewing the transference neurosis from the perspective of psychological field and object relationships will allow for further understanding of psychic development and the therapeutic process." (24 ref.)—*L. W. Brandt.*

3743. **Rosolato, G.** *L'hystérie: Structures psychanalytiques.* [Hysteria: Psychoanalytic structures.] *Evolut. psychiat.*, 1962, 27(2), 225-258.—A psychoanalytic resumé of the structural characteristics of hysteria includes the following areas: (a) the S's mirror-image and the imaginary danger of corporal disruption in relationships with the mother; (b) the dialectic opposition of being and having; (c) the oral and phallic stages; (d) the function of the ideal ego, as opposed to the ego ideal; and (e) an emphasis upon the role played by emotions. Hysteria is considered an illness of metaphor, whereas obsessional neurosis is one of metonymy. The article concludes by differentiating many allied phenomena, such as anxiety, phobic and traumatic neurosis, and various psychic disorders.—*L. A. Ostlund.*

3744. **Schiffer, I.** (Toronto) *The psychoanalytic study of the development of a conversion symptom.* *Int. J. Psycho-Anal.*, 1962, 43(2-3), 169-174.—Conversion symptoms represent a form of non-verbal communication, much as a dream communicates through symbolism. The disturbed individual unconsciously selects, in conversion hysteria, the body part which symbolizes the conflict he is undergoing.—*G. Elias.*

3745. **Stephens, Joseph H., & Kamp, Martin.** (Johns Hopkins U. School Medicine, Baltimore, Md.) *On some aspects of hysteria: A clinical study.* *J. nerv. ment. Dis.*, 1962, 134(4), 305-315.—Study of the records of 100 in-patients diagnosed as hysteria at the Henry Phipps Psychiatric Clinic between the periods 1913-1920 and 1945-1960 showed similar rates and symptoms, thus failing to support the belief that conversion reactions are disappearing.—*N. H. Pronko.*

3746. **Wiesenhütter, E.** (U. Würzburg) *Gegenwärtiger Stand der Neurosenforschung.* [The present status of research on neuroses.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 199-213.—An examination of the definition of the concept of neurosis shows that the name neurosis is an operational, hypothetical, cumulative concept. Therefore, the research concerning neurosis is concerned with different aims which could be summarized in the following 5 categories: (a) the observation and differentiation of expressions, symptoms, and structures of neuroses; (b) problems concerning origin and etiology; (c) the importance and meaning for individual concern and environment; (d) distinction from other illnesses and normal psychological phenomena; and (e) the treatment. The present status of research concerning each of the above-mentioned problems is summarized from historical and theoretical standpoints. Modern treatment methods including psychoanalysis, psychotherapy, and especially group therapy,

are described. Newest contributions for the study of neurosis in using the projective techniques, especially the TAT and CAT, are given special treatment.—*V. J. Bieliauskas.*

PSYCHOSOMATICS

3747. Ackner, B., Cooper, J. E., Gray, C. H., & Kelly, Margaret. (Maudsley Hosp., London, England) **Acute porphyria: A neuropsychiatric and biochemical study.** *J. psychosom. Res.*, 1962, 6(1), 1-24.—To investigate the role of neurotic personality and emotional factors in precipitating acute attacks of porphyria, psychiatric, psychological, and EEG investigations, together with daily measurements of the urinary excretion of porphobilinogen and d-aminolacvulinic acid have been carried out in 13 Ss with acute porphyria. No evidence was found for a psychogenic factor in the etiology of the disorder. (20 ref.)—*W. G. Shipman.*

3748. Alexander, Franz. (Mt. Sinai Hosp., Los Angeles, Calif.) **The development of psychosomatic medicine.** *Psychosom. Med.*, 1962, 24(1), 13-24.—After a historical review of the swings between a physical and a mental point of view about disease causation, Alexander summarizes his past and present psychosomatic studies. (22 ref.)—*W. G. Shipman.*

3749. Bagge, Lars. (University Hosp., Lund, Sweden) **Acute appendicitis patients as a control group in psychosomatic investigations.** *J. psychosom. Res.*, 1962, 6(1), 25-36.—In order to test the representativeness of appendicitis patients as normal control persons in psychosomatic research, 65 females with acute appendicitis were studied. 43 were compared with randomly selected healthy women matched for age. Compared with the controls the appendicitis group had more migraine sufferers in their families, fewer upper respiratory tract infections, greater body fat, and fewer phobic symptoms in their history. These findings are discounted since many comparisons were made.—*W. G. Shipman.*

3750. Bruch, Hilde. (Columbia U.) **Perceptual and conceptual disturbances in anorexia nervosa.** *Psychosom. Med.*, 1962, 24(2), 187-194.—Clinical symptoms and psychodynamic data on 12 patients with the classic anorexia syndrome are presented. 3 characteristics were noted: disturbances in body image of delusional proportions; disturbance in the accuracy of the perception or recognition of bodily states e.g., nutritional needs; and an all-pervading sense of ineffectiveness.—*W. G. Shipman.*

3751. Castelnovo-Tedesco, P. (U. California School Medicine, Los Angeles) **Ulcerative colitis in an adolescent boy subjected to a homosexual assault.** *Psychosom. Med.*, 1962, 24(2), 148-156.—"The case is presented of a 14-year-old boy who was afflicted with ulcerative colitis following a homosexual attack and series of events in which he was inflexibly disciplined and sharply coerced. The patient's predicament is discussed primarily in terms of the dynamics of his obsessive-compulsive character structure and the problem of rebellion versus compliance which appears to have been of fundamental importance.—*W. G. Shipman.*

3752. Daniels, G. E., O'Connor, J. F., Karush, A., Moses, L., Flood, C. A., & Lepore, M. (Columbia U.) **Three decades in the observation and treatment of ulcerative colitis.** *Psychosom. Med.*,

1962, 24(1), 85-93.—57 cases of ulcerative colitis who had had at least 7 sessions of psychotherapy have been systematically followed. Psychiatric diagnosis was very predictive. Most operations and deaths occurred in conjunction with schizophrenia. Psychotherapy was judged to improve the life adjustment of 46 of the cases. (31 ref.)—*W. G. Shipman.*

3753. Dudley, John G., & Lennon, E. J. (Boise, Idaho) **Reciprocal innervation in the treatment of respiratory dysfunction.** *Cerebral Palsy Rev.*, 1962, 23(4), 3-4.—A compensatory reflex stimulation technique, involving the use of brush and ice as stimuli, is described in contrast to blowing and other conscious training exercises. A brief theoretical explanation is presented.—*T. E. Newland.*

3754. Dykman, R. A., Corson, S. A., Reese, W. G., & Seager, L. D. (U. Arkansas Medical Cent., Little Rock, Ark.) **Inhibition of urine flow as a component of the conditional defense reaction.** *Psychosom. Med.*, 1962, 24(2), 177-186.—In 2 mongrel dogs with polyethylene tubes connected to miniature bladders it was found that the conditioning environment, in which noxious stimulation was given, acquired a marked inhibitory effect on urine flow even under conditions of massive water loading. This could be disinhibited by the experimenter petting the dog. Heart rate and motor flexion responses to a painful stimulus conditioned more differentially, more specifically, and more persistently than did rate of urine production. (34 ref.)—*W. G. Shipman.*

3755. Eagleton, G., & Sines, J. O. (Washington U., St. Louis) **Free gastric acidity and intestinal mobility in normal and stomach lesion susceptible rats.** *J. psychosom. Res.*, 1962, 6(1), 37-40.—The amount of free HCl in the stomachs of a group of 13 normal rats was compared to that found in the stomachs of a group of 18 stomach lesion susceptible animals, after food deprivation, and after 1 hour immobilization. No differences were found between the groups. But the stomach lesion susceptible animals showed significantly greater intestinal motility than did their controls.—*W. G. Shipman.*

3756. Engel, George, L. (U. Rochester Medical Cent., N. Y.) **Guilt, pain, and success.** *Psychosom. Med.*, 1962, 24(1), 37-48.—"A case is presented in which is considered the role of pain in making success possible in a guilt-ridden man. A glomus tumor of the toe and a peptic ulcer both acted as a source of severe pain for more than 25 years during which the sufferer achieved great success in the business world. Each 'successful' medical intervention was followed by a worsening of his general condition."—*W. G. Shipman.*

3757. Feingold, B. F., Gorman, F. J., Singer, Margaret T., & Schlesinger, K. (Kaiser Found. Hosp., San Francisco, Calif.) **Psychological studies of allergic women.** *Psychosom. Med.*, 1962, 24(2), 193-202.—The MMPI was administered to 40 married, female allergy patients. Those with mild skin reactions had significantly more disturbed psychiatric conditions than those with marked skin reactions. (16 ref.)—*W. G. Shipman.*

3758. Graham, D. T., Kabler, J. D., & Graham, Frances, K. (U. Wisconsin School Medicine, Madison) **Physiological response to the suggestion of attitudes specific for hives and hypertension.** *Psychosom. Med.*, 1962, 24(2), 159-169.—20 healthy male

students were given 2 attitude suggestions on each of 2 days, with order reversed the 2nd day. It was predicted that skin temperatures would rise with the hives suggestion (you feel unjustly treated and can think of nothing you want to do about it) and that diastolic blood pressure would rise more with the hypertension attitude (you have to be on guard against bodily assault). The predictions were confirmed. (16 ref.)—*W. G. Shipman*.

3759. Ham, George, C. (U. North Carolina School Medicine, Chapel Hill) **Psychosomatic perspectives: The cardiovascular system.** *Psychosom. Med.*, 1962, 24(1), 31-36.—The literature is reviewed and areas for further research are indicated. The need to see the disorder in the context of past history and present efforts at adjustment is emphasized. (62 ref.)—*W. G. Shipman*.

3760. Jortner, Sidney Selig. (New York U.) **An investigation of certain intellectual and personality characteristics of multiple sclerotics: A comparison of the psychological functioning of multiple sclerotics with that of brain-damaged and peptic ulcer patients as a means of testing the psychosomatic hypothesis of multiple sclerosis.** *Dissert. Abstr.*, 1962, 22(12), 4406-4407.—*Abstract*.

3761. Kissen, D. M. (U. Glasgow, Scotland) **Relationship between primary lung cancer and peptic ulcer in males.** *Psychosom. Med.*, 1962, 24(2), 133-147.—458 new male admissions to 2 wards were questioned about their illness history without knowledge of the current diagnosis. Subsequently 212 were diagnosed lung cancer, 199 had noncancerous conditions, and 47 had psychosomatic conditions. "Lung-cancer patients show a broad similarity to the psychosomatic controls in the incidence of past psychosomatic disorders; they tend, however to have had rather more peptic ulcers and rather less other psychosomatic conditions." (32 ref.)—*W. G. Shipman*.

3762. LeShan, Lawrence. (Inst. Applied Biology, NYC) **Present views in psychosomatic cancer research.** *J. Amer. Soc. Psychosom. Dent. Med.*, 1962, 9(3), 76.—A brief article pointing out the conflict in results and studies in this area.—*J. H. Manhold, Jr.*

3763. Peoples, Landon Crocker. (U. Tennessee) **A study of important stimuli in the lives of men with cancer.** *Dissert. Abstr.*, 1961, 22(6), 2071.—*Abstract*.

3764. Plesch, Egon. **Reddening and paranoid experience: Some psychological and biological implications.** *Acta psychother. psychosom.*, Basel, 1962, 10(1), 45-52.—Among 20 women with rosacea, morbid reddening, or both, all revealed paranoid trends with well-defined systems protecting against them. The reddening is a vestigial biological factor in the patient's paranoid defences, emerging in states of regression.—*G. Rubin-Rabson*.

3765. Rothenberg, Albert. (USA Rodriguez Hosp., Fort Brooke, Puerto Rico) **Psychological problems in terminal cancer management.** *Cancer*, 1961, 14, 1063-1073.—Through the tracing of the intrapsychic and interpersonal factors operating between patient and hospital house staff, 4 illustrative cases are used to show how psychological problems of terminal cancer patients arise. 5 specific sociopsychological issues are outlined: the house staff tend to

(a) avoid issues that manifest the fact of loss of control, (b) support denial, (c) encourage isolation, (d) discourage the expression of grief, and (e) overestimate the patients' incapacity because of their own sense of failure. Although the attending physician might justifiably feel some of these trends inpatient-staff interaction should not be interfered with in a specific case, he must be aware of them as potential trouble spots.—*S. E. Waxenberg*.

3766. Rubin, J., Nagler, R., Spiro, H. M., & Pilot, M. L. (Yale U. School Medicine, New Haven, Conn.) **Measuring the effect of emotions on esophageal motility.** *Psychosom. Med.*, 1962, 24(2), 170-176.—Esophageal motility was studied by means of pressure transducers in 5 adults as each had 3 unstructured psychiatric interviews. "A significant relationship between affectively charged material and nonpropulsive activity in the esophagus was consistently found in 2 of 5 Ss and, during some interviews, in other Ss."—*W. G. Shipman*.

3767. Schachter, M. **Étude des encéphalopathies infantiles consécutives à des brûlures.** [Encephalopathies in children as a sequel to burns.] *Acta paedopsychiat.*, Basel, 1962, 29(6), 161-172.—Pathological additional factors (birth trauma prematurity, toxico-sis) often prepare the field for later severe burns in children to produce neurological and psychological disturbances of varying degrees.—*G. Rubin-Rabson*.

3768. Schneider, S. F. (U. Michigan, Ann Arbor) **A psychological basis for indifference to pain.** *Psychosom. Med.*, 1962, 24(2), 119-132.—Neurological, psychiatric, and psychological findings concerning 3 patients showing indifference to pain were reviewed. Their common traits were denial of weakness, helplessness, and passivity, and their insistence of personal invincibility. The best explanation: "regressive reactivation of denial by the ego under the impact of phallic or oedipal conflicts."—*W. G. Shipman*.

3769. Shannon, Ira L., Szymid, Lucian, & Prigmore, John R. **Stress in dental patients: Serum and urine 17-hydroxycorticosteroid responses in impaction patients.** *USAF SAM Rep.*, 1962, No. 62-59. 5 p.—A total of 91 impacted lower third molars was removed; and patient adrenocortical response, both before and after surgery, was measured. Both serum free and urine total 17-hydroxycorticosteroids were determined in these patients and in 33 control Ss. The preoperative serum mean of 20.68 gamma percent for the surgery patients was significantly higher than that of 14.17 gamma percent found for the controls. It was also significantly higher than the 13.74 gamma percent found for our 633 laboratory control Ss and the 17.53 gamma percent for 286 Se scheduled for simple exodontia. 1 hour after operation the effect of anticipating and experiencing impaction surgery was no longer evident. Urinary excretion of corticosteroids was not significantly different for the impaction and control groups.—*USAF SAM*.

3770. Smith, R. E. (Portland State Coll.) **A Minnesota Multiphasic Personality Inventory profile of allergy.** *Psychosom. Med.*, 1962, 24(2), 203-209.—The MMPI was administered to 36 allergic patients and to 36 nonallergic normals matched individually for age, sex, education, socioeconomic, and marital status. Female allergic patients had a higher Ma score. Male allergic patients were significantly higher

than controls on F, Pt, Sc, and Ma. (21 ref.)—W. G. Shipman.

3771. Sugar, Max, & Watkins, Charles. (Louisiana State U. School Medicine) Some observations about patients with a breast mass. *Cancer*, 1961, 14, 979-988.—In order to learn if and why they delayed seeking treatment, 50 women with a breast mass were interviewed prior to their having a final diagnosis made at operation. 11 were found to have breast cancer, 23 to have benign lesion at operation, and 16 clinically did not have cancer. Knowledge of cancer symptoms did not keep patients from seeking help. Patients who were fearful about the possible cause of the mass were not kept away by fear. The patients seen early for treatment tended to exhibit anxiety. The majority of patients who delayed showed depression and little fear, and they did not care what happened to them. Most of the patients found to have cancer had delayed seeking help and were depressed. Most of the patients who were found to have a benign lesion had sought treatment promptly and were anxious.—S. E. Waxenberg.

3772. Turnbull, J. W. (Jewish National Home Asthmatic Children, Denver, Colo.) Asthma conceived as a learned response. *J. psychosom. Res.*, 1962, 6(1), 59-70.—Citing the relevant learning theory, the author formulates an explanation of the asthma-like response and gives a number of testable implications of this formulation. (34 ref.)—W. G. Shipman.

3773. Williams, Robert Lee. (Washington U.) The relationship of body-image to some physiological reactivity patterns in peptic ulcer and rheumatoid arthritic patients. *Dissert. Abstr.*, 1962, 22 (12), 4415-4416.—Abstract.

3774. Wolff, Harold, G. A concept of disease in man. *Psychosom. Med.*, 1962, 24(1), 25-30.—General morbidity, other than in childhood, has not been reduced. Periods of threatening significance to a man have sweeping effects on his resistance of illness. This is documented for the mucous membrane, vascular system, and skin. Illness rates are higher in immigrants, prisoners of war (even after their liberation), and in the aged when responsibilities and morale drop. Behavioral and attitudinal reactions serving to protect in a crisis may become inappropriate in amount and kind, thus leading to organ breakdown, diseases, or premature aging.—W. G. Shipman.

3775. Ziegler, Frederick J., & Imboden, John B. (La Jolla, Calif.) Contemporary conversion reactions: II. A conceptual model. *Arch. gen. Psychiat.*, 1962, 6(4), 279-287.—The theoretical concept of conversion is misapplied to phenomena. A 4-year observation of 134 conversion patients showed 40 to have depressions; 19, incipient schizophrenia; others, ego identity problems or "features of 'neurotic anxiety' in the clinical sense of that term." Clinical evidence and scientific considerations indicate that conversions defend not only against anxiety but against dysphoric affects in general and that no specific energy is transformed. Conversions are suggested to be symbolic communications of distress by means of displaying the signs of a somatic illness. The symptoms depend on the patient's perception and knowledge of physical illness. (59 ref.)—L. W. Brandt.

EPIDEMIOLOGY

3776. Finney, Joseph C. (550 Makapuu Ave., Honolulu, Hawaii) Prolegomena to epidemiology in mental health. *J. nerv. ment. Dis.*, 1962, 135(2), 99-104.—"Mental health epidemiology presupposes that a case of mental sickness can be defined by objective criteria. A definition and criteria are proposed, based on the measurement of servo-mechanisms and their effectiveness."—N. H. Pronko.

3777. Hollingshead, August B. (Yale U.) Lower socioeconomic status and mental illness. *Sociol. soc. Res.*, 1962, 46(4), 387-396.—The materials presented are selected from families in San Juan, Puerto Rico. In 50% of the families, one spouse is suffering from schizophrenia; in the other 50%, both spouses are mentally healthy. Comparable data are available on each type of family. More mental illness is reported in the families of orientation where one spouse is schizophrenic than in the families where both spouses are free of psychotic illness.—*Journal abstract*.

3778. Horner, Robert Franklin. (U. Tennessee) A search for important stimulus variables in the early family relationships of schizophrenic patients. *Dissert. Abstr.*, 1961, 22(6), 2070.—Abstract.

3779. Innes, George, & Sharp, Geoffrey A. (U. Aberdeen, Scotland) A study of psychiatric patients in north-east Scotland. *J. ment. Sci.*, 1962, 108(Whole No. 455), 447-456.—A 12-month population, of 863 males and 1240 females, was analyzed. Urban referrals were higher than rural, and divorced persons had high referral rates. Professional and unskilled laboring classes were disproportionately high.—W. L. Wilkins.

3780. Jensen, Sven E. (York County Mental Health Clinic, Newmarket, Ontario, Canada) Five psychotic siblings. *Amer. J. Psychiat.*, 1962, 119(2), 159-163.—"A family is presented in which 5 of 7 siblings and 10 of 17 members of the last 2 generations have had psychotic episodes. At least 5 members have experienced their mental illness in connection with childbirth, and 2 in connection with back injury. It is suggested that our interpretation does not rule out a hereditary or somatic concept."—N. H. Pronko.

3781. Juel-Nielsen, N., Bille, M., Flygenring, J., & Helgason, T. (Aarhus State Hosp., Risskov, Denmark) Frequency of depressive states within geographically delimited population groups: III. Incidence (the Aarhus county investigation). *Acta psychiat. Scand., Copenhagen*, 1961, 37(Suppl. No. 162), 69-80.—From a total population of about 220,000, all cases were selected who within 1 year had required contact with any one of the institutions—psychiatric as well as nonpsychiatric—which admit patients from this population group. Between 0.2% and 0.5% of the adult population (with a high preponderance of females) were involved. Only 1/4 of these patients were treated in a psychiatric department.—R. Kaelbling.

3782. Malzberg, B. (Research Found. Mental Hygiene, Albany, N. Y.) Migration and mental disease among the white population of New York State: 1949-1951. *Hum. Biol.*, 1962, 34(2), 89-98.—For the three years ending September 30, 1961 the average annual standardized rate of 1st admissions

to all hospitals for mental disease in New York State was 171.9 per 100,000 population for white internal migrants, and 135.4 for white nonmigrants. The difference, which is statistically significant, confirms data previously reported for New York State.—P. Swartz.

3783. Prabha, N., & Sastry, M. N. S. Prevalence of maternal and paternal deprivation in schizophrenics and neurotics. *Trans. All-India Inst. Ment. Hlth.*, 1960, 1, 8-16.—Analysis of data from 216 cases shows that: loss of the father was more frequent than that of the mother; loss of the father in adolescence seems to affect males more, while the latency period of prepubescence (5-14 years) seem to be crucial in the case of females; and loss of the mother between the ages of 6 and 14 appears to be crucial for the schizophrenics, while the same loss during the formative period (before 6 years of age) seems crucial for neurotics.—U. Pareek.

3784. Sørensen, Andreas, & Strömgen, Erik. (Aarhus State Hosp., Risskov, Denmark) Frequency of depressive states within geographically delimited population groups: II. Prevalence (the Samsø investigation). *Acta psychiat. Scand., Copenhagen*, 1961, 37(Suppl. No. 162), 62-68.—On census day there were 6447 inhabitants on this Danish island, 4974 of whom were over 15. (Only on 98 was the information insufficient to conclude whether they were depressed or not.) 3.9% of the population above 20 were found to be suffering from some form of depression. The prevalence was considerably higher in females. Depressive neuroses were diagnosed in 77%. The cases were brought to the attention of the investigators by the local physicians, who between themselves knew almost everyone on the island very well.—R. Kaelbling.

EDUCATIONAL PSYCHOLOGY

3785. Burroughs, G. E. R. (U. Birmingham) Educational research today: II. Co-operative research in Institutes of Education. *Brit. J. educ. Psychol.*, 1962, 32(2), 182-187.—The article describes responsibilities of institutes for research and then presents a brief historical account of endeavors at one institute.—B. T. Jensen.

3786. Conrad, Herbert S. (US Office Education, Washington, D. C.) Research in education: Directions and misdirections. *Teachers Coll. Rec.*, 1962, 64(1), 13-19.—Educational research should concern itself not only with what to do but how to do it. It should use more often the large-scale, long-term, comprehensive "systems" approach. Key problems are gaining recognition for the contributions of psychological research and getting enough money. "Rudolph Flesch, in a book devoid of scientific merit, was able single handedly to blackball years of research and progress in the teaching of reading." Why was this possible?—H. K. Moore.

3787. DiVesta, Francis J. (Syracuse U.) Meaningful learning: Motivational, personality, interpersonal, and social variables. *Rev. educ. Res.*, 1961, 31(5), 511-521.—"This chapter deals with studies of the motivational, personality, and social-cultural variables affecting meaningful learning. The section on extrinsic versus intrinsic motivation surveys the motivating effects of instructions on ego involvement, level of aspiration, and achievement

motive. The personality variables given greatest attention are anxiety, self-attitudes, authoritarianism, and values and interests. The section on research on social-cultural variables includes teacher-pupil and peer relationships as well as group versus individual learning settings and the learning-variable concomitants of socioeconomic status." (73 ref.)—F. Goldsmith.

3788. Frank, Helmar. *Kybernetische Grundlagen der Pädagogik*. [Cybernetic foundations of education.] Baden-Baden, Germany: Agis, 1962, 175 p. DM 12.80.—Philosophical, mathematical, and physiological foundations of what the author calls information-psychology are presented. The conventional S-R process is described in terms of binary coding and neuron networks with respect to gestalt-psychology phenomena. Numerous implications of information-psychology for education are listed.—K. J. Hartman.

3789. Jensen, Arthur R. (U. California, Berkeley) The improvement of educational research. *Teachers Coll. Rec.*, 1962, 64(1), 20-27.—Why is there so little significant research in education despite the number of educational magazines and the number of doctorates granted? Insufficient money is only symptomatic. It is largely the gulf that exists between education and the systematic study of human behavior, and the sort of people who seek doctorates in education. A remedy is to establish in universities, departments of educational research apart from the schools of education.—H. K. Moore.

3790. Jenson, Theodore J., & Staub, W. Frederick. (Ohio State U.) School-community relations. *Rev. educ. Res.*, 1961, 31(4), 406-416.—Intensified interest on the part of lay and professional people, concern for the standing of American education in the world community, mobility and social change, and outright competition of education with other public services sharpened the focus on needs for research for better understanding of school-community relations. Much of the research was not highly significant and consisted of hindsight after bond elections had failed, limited opinion research on effectiveness of items in public relations programs, and speculative studies. More rigor, better design, and new theory are needed. (62 ref.)—F. Goldsmith.

3791. Joncich, Geraldine. (U. California, Berkeley) Whither thou, educational scientist. *Teachers Coll. Rec.*, 1962, 64(1), 1-12.—"If the pseudo-science of much of recent educational research faces displacement, the time is surely ripe for re-study of that earlier time of faith and pride when a more rigorous concept of the science of education prevailed.—H. K. Moore.

3792. Kreitlow, Burton W. (U. Wisconsin) Organizational patterns: Local school districts. *Rev. educ. Res.*, 1961, 31(4), 380-392.—The general theory which supported reorganization as a basis of improving opportunities was upheld in practice. There was an increasing amount of evidence that pupil achievement was aided by reorganization. This was adequately proved at the elementary grade levels but not so completely at high-school levels. Reorganized school districts provided equal opportunities at lower cost. Reorganization for the purpose of increasing opportunities and achievement often cost the taxpayer more, either through local property

taxes or through sources outside the local community. (53 ref.)—*F. Goldsmith.*

3793. Peel, E. A. (U. Birmingham) **Educational research today: I. Priorities in educational research.** *Brit. J. educ. Psychol.*, 1962, 32(2), 178-181.—Research workers should turn more to processes and should avoid aimless surveys. This would put priorities on studies of school learning, concept formation, thinking and reasoning, motivation, and growth of values and morale.—*B. T. Jensen.*

3794. Roe, William H. (Michigan State U.) **Organizational patterns: State and federal.** *Rev. educ. Res.*, 1961, 31(4), 368-379.—During the last 3 years several trends were noted in the organizational patterns of state, national, and intermediate administration of education. The federal government increased its contact activities, yet lacked clear-cut policies. State units emphasized consultation and service and de-emphasized inspection. The efficiency of local school districts was questioned, and proposals were made for organization of larger intermediate units. Studies were essentially descriptions and surveys, but no trend for more profound research of an experimental and controlled variety was observed. Little use was made of dissertation research. (85 ref.)—*F. Goldsmith.*

3795. Wilson, E. M. **Cumulative index of Volumes I-XXX: 1930-1960.** *Brit. J. educ. Psychol.*, 22 p.—Subject and author indices.—*B. T. Jensen.*

SCHOOL LEARNING

3796. Belyaev, V. B. (Moscow, USSR) **K kharakteristike zarubezhnoi (zapadnoevropeiskoi i amerikanskoi) psikhologii obucheniya inostrannyim yazykom.** [Towards a characterization of the foreign (Western-European and American) psychology of training in foreign languages.] *Vop. Psikhol.*, 1962, No. 1, 157-167.—A review of work on the title subject done during the 1st half of the century. The author summarizes current foreign trends mentioning specifically trends toward: (a) practical use of language and not a theoretical knowledge; (b) emphasis of thinking directly in the foreign language rather than translating; (c) training in various methods for ascertaining the meaning of a foreign language selection; (d) increased size of units which are taught, e.g., phrases rather than words; (e) training in the spoken language preceding training in the written language; and (f) taking an eclectic approach to language training methods. (92-item bibliogr.)—*H. Pick.*

3797. Bowers, Norman D. (U. North Carolina) **Meaningful learning and retention: Task and method variables.** *Rev. educ. Res.*, 1961, 31(5), 522-534.—"Presentation of material to maximize pupil learning and retention is a major problem confronting the classroom teacher. Obviously, great variability is possible both in the instructional materials and in the methods of presentation. Materials may vary in such factors as difficulty, sequence, potential meaningfulness, redundancy, and internal organization. Presentation may vary according to such characteristics as type of classroom organization, teaching style, and procedure. Variability stemming from materials is, in this chapter, termed task variable; variability stemming from the procedures used by the teacher is termed method variable. In the

classroom learning situation, task variables require reaction by a pupil to a demand or suggestion of the teacher, other pupils, or the pupil himself. Method variables are basically those teacher behaviors that condition the learning situation in the classroom." (76 ref.)—*F. Goldsmith.*

3798. Dubovis-Aranovskaya, D. M. (Khar'kovskii U.) **O nekotorykh usloviyakh ponimaniya struktury teksta uchashchimisya.** [On some conditions for pupils' comprehension of the structure of a text.] *Vop. Psikhol.*, 1962, No. 1, 53-60.—Pupils of the 5th through 7th grades were asked to make general plans of a narrative selection. 3 levels of performance were noted: the highest level indicating comprehension of the general structure of text and the author's ideas, a 2nd level not reflecting the general structure but rather reflecting images evoked by particular aspects of the material, a 3rd level reflecting mainly the pupils' own reaction to the text rather than the authors' ideas. The inadequacy of the latter 2 levels seem to be due to such factors as improper orientation to the structure and inability to abstract. An intensive training experiment was initiated to evaluate the feasibility of training pupils to grasp the plan of a text. 3 variations of training were used: one where the children were taught to outline only narrative texts, one where they were taught successively to outline narrative and descriptive texts, and one where they were taught both simultaneously. The latter procedure was most effective in comparison with a control group which did not improve.—*H. Pick.*

3799. Gagné, Robert M., Mayor, John R., Garstens, Helen L., & Paradise, Noel E. (Princeton U.) **Factors in acquiring knowledge of a mathematical task.** *Psychol. Monogr.*, 1962, 76(7, Whole No. 526), 20 p.—This experimental study reports on effects of variation in certain theory-relevant features of a learning program on the progress of learning and its impact on those to whom it was administered. 4 different forms of a chapter in a text entitled *Mathematics for the Junior High School* were administered over a 4 day period to 136 students in 4 7th grade classes. It was found that prior mastery of subordinate learning sets directly influenced the acquisition of learning sets at ascending stages of hierarchical levels. At each stage a part of the achievement of the higher learning gave evidence of positive transfer. There was no evidence of differences in the performance on postlearning tasks that was related to low and high ability as based upon the criterion of previous mathematics grades. The findings give emphasis to the relatively small effects of the experimental variables in contrast to the effects produced by the addition or omission of learning sets.—*M. A. Seidenfeld.*

3800. Krumboltz, John D. (Stanford U.) **Meaningful learning and retention: Practice and reinforcement variables.** *Rev. educ. Res.*, 1961, 31(5), 535-546.—Interest in the application of reinforcement psychology to meaningful school learning situations has developed rapidly in the last 3 years. Much of the interest was generated by the development of the teaching machine and programmed learning approach, which provided a technique for investigating systematically some of the variables involved. Selected research findings are categorized under 4 problems in learning: (a) evoking the desired response,

(b) reinforcing the desired response, (c) maintaining and improving the desired response, and (d) eliminating the undesired response. (45 ref.)—*F. Goldsmith*.

3801. Loginova, E. A. (Leningrad, USSR) *Ovliyanii interesa na zapominanie novykh slov pri izuchenii inostrannogo yazyka*. [On the influence of interest on remembering new words during the study of a foreign language.] *Vop. Psikh.*, 1962, No. 1, 61-64.—37 1st year students in an institute of physical culture were taught 10 general German words and 10 words related to competitive sports. A variety of vocabulary training methods all yielded results indicating an advantage of from 3.4 to 12.0% in learning the sport relevant words.—*H. Pick*.

3802. Morrison, Flora M., Warburton, Marjory; Ormrod, Georgina; Gelilee, Dorothy; Cassell, Cynthia; Williams, Monica; Medhurst, Dorothy; Daly, Genevieve, & Lea, Marjorie. (St. George's Elementary School, Toronto, Canada) *A healthy climate for learning*. *Bull. Inst. Child Stud., Toronto*, 1962, 24(2, Whole No. 93), 1-20.—A collection of 9 descriptive articles by members of the staff of St. George's Elementary School covering various aspects of kindergarten through 6th-grade teaching. They demonstrate that "As much as possible, the individual child's needs, rate of development and intellectual potential are taken into account. Our aim is to make learning interesting, satisfying and efficient by providing a healthy climate for learning."—*D. G. Appley*.

3803. Muehl, Siegmund. (Iowa Child Welfare Research Station) *The effects of letter-name knowledge on learning to read a word list in kindergarten children*. *J. educ. Psychol.*, 1962, 53(4), 181-186.—The effects of learning letter names on the subsequent acquisition of word-name associations was investigated utilizing 87 kindergarten Ss divided into 2 groups on the basis of their pretraining experience. A "relevant group" learned names for 3 letters that subsequently appeared as the critical stimuli in 3 nonsense words that were paired with pictures of familiar objects for paired-associate presentation. An "irrelevant group" learned names for letters that did not appear in the words on the transfer task. Knowledge of relevant letter names produced interference in the word-naming task, a finding which was interpreted in relation to evidence from classroom reading research.—*Journal abstract*.

3804. Robertson, James Patrick S. (Netherne Hosp., Coulsdon, England) *On learning names of parts of an anatomical diagram*. *Psychol. Rep.*, 1962, 10(2), 576.—A description of learning performance of 327 nurses and relationship to other skills.—*B. J. House*.

3805. Schoer, Lowell. (State U. Iowa) *Effect of list length and interpolated learning on the learning and recall of fast and slow learners*. *J. educ. Psychol.*, 1962, 53(4), 193-196.—The present study was undertaken to determine whether differential susceptibility to inhibition may influence learning of fast vs. slow learners. Each S learned either a 7- or a 14-item list of paired adjectives and recalled and relearned it 24 hours later. 50% of the Ss learned a 9-item interpolated list just prior to the recall of the 7- or 14-item list learned originally. A significant interaction between ability level and list length was found when the criterion measures em-

ployed were trials-to-learn and probability of occurrence of a correct response after 2 and 3 reinforcements. Interpolated learning did not affect the recall of fast and slow learners differentially.—*Journal abstract*.

3806. Skemp, R. R. (U. Manchester) *The need for a schematic learning theory*. *Brit. J. educ. Psychol.*, 1962, 32(2), 133-142.—After arguing that a schematic theory would be applicable to education, author describes an experiment to demonstrate the importance of schema in a relatively simple learning task. 2 groups of pupils learned material by either rote or schematic procedures. Retention was better for the schematic learning group.—*B. T. Jensen*.

3807. Sokolova, E. N. (Inst. Psychology, APN, RSFSR, Moscow) *Osobennosti Zritel'nykh predstavlenii u detei razlichnykh vozrastov v protsesse lepkii*. [Properties of visual ideas in children of various school ages in the process of modeling.] *Vop. Psikh.*, 1962, No. 1, 81-88.—Children in the 1st, 3rd, and 5th grades were asked to make models of various objects according to their imagination. The lack of detail in the models indicated that most of the children seemed to have very vague and general ideas of the objects. Some of the pupils could consciously recall some of the omitted details when questioned by E. These details sometimes occurred involuntarily to the 1st grade pupils. Additional experiments were carried out in which the pupils made models, after listening to a description of the object by E, after viewing a contour drawing, after viewing a perspective drawing, and after viewing the real object. Results indicated that the idea of the objects improved with the improved conditions for obtaining information. The 5th grade children improved most. The 1st grade children had most difficulty accomplishing anything after the description by E.—*H. Pick*.

3808. Surányi, Gábor. *Nagyságbecslés emlékezet után*. [Evaluation of remembered height.] *Psichol. Tanulmányok*, 1958, 1, 95-103.—The results of Galkina's studies concerning elementary school children's perceptions were confirmed in this study regarding the accuracy of remembered perception of certain animal heights. Height was better remembered if the animal had been shown previously to the children, but even this did not lead to accurate evaluation. In another experiment the children had to draw a pitcher and glass from memory. Only 28.57% could draw it in the right proportion. Better results were obtained when instructions were given pointing to the phenomenon of "bigger than." Implications for improving teaching methods are discussed. (Russian & English summaries.)—*E. Friedman*.

3809. Wittrock, M. C. (U. California, Los Angeles) *Set applied to student teaching*. *J. educ. Psychol.*, 1962, 53(4), 175-180.—To determine if a set to teach for pupil gain influences learning, student teachers in the experimental group were told that their final course grades in educational psychology and in student teaching depended upon the amount of pupil gain. Differences between pretests and posttests for 787 secondary school students of English, American government and history, and social studies indicated that the experimental group of teachers produced more ($p < .001$, 2-tailed) student gain than did a control group of student teachers. An analysis of covariance of the posttest scores adjusted for the

pretest scores supported the above result ($p < .05$). It was concluded that the concept of set finds application in teaching.—*Journal abstract*.

INSTRUCTIONAL AIDS

3810. Asher, J. J. (San Jose State Coll.) **Sensory interrelationships in the automated teaching of foreign languages.** *Percept. mot. Skills*, 14 (1), 38.—Ss learned 92 Spanish vocabulary items in one sensory modality and relearned in the other. Transfer from the words to syntactic use was tested. Ss learning visually and relearning aurally performed better in all respects than those learning aurally and relearning visually.—*W. H. Guertin*.

3811. Calvin, Allen D., & Hanley, Charles. (Behavioral Research Lab., Palo Alto) **Exposure to programmed learning material and reading comprehension.** *Psychol. Rep.*, 1962, 10(2), 538.—High school students ($N = 222$) who had taken programmed instruction in geometry had higher speed of reading comprehension scores than controls ($N = 84$) given the standard classroom course. Groups given programmed instruction in Algebra did not differ from controls on reading tests.—*B. J. House*.

3812. Hallworth, H. J. (U. Birmingham) **Electronic computer programmes for psychologists.** *Bull. Brit. Psychol. Soc.*, 1962, 48, 16-21.—The article gives details of the programs available to British psychologists.—*C. C. Kiernan*.

3813. Markle, Susan Meyer. (U. California, Los Angeles) **Teaching machines versus programmers.** *Audiouis. commun. Rev.*, 1962, 10(4), 286-292.—A discussion of the restrictions that machines impose on self-instructional programming and how these restrictions can be overcome. 35-frame program-excerpt.—*R. E. Schutz*.

3814. Mialaret, G., & Malandain, C. **Etude de la reconstitution d'un récit chez l'enfant à partir d'un film fixe.** [Study of the reconstruction of a story by the child from a film strip.] *Enfance*, 1962, No. 2, 169-190.—To study the factors involved in the interpretation of pictures, 122 boys and 90 girls, age 7-12, were shown 3 film strips each depicting a story and asked to tell the story from memory immediately after the 2nd of 2 presentations. Results were analyzed according to Binet's categories of enumeration, description, and interpretation. Interpretation responses were more frequent at all ages, while enumeration and description declined in frequency with age. The global responses could be classed as (a) correct synthesis, (b) incomplete synthesis, (c) false synthesis, and (d) no synthesis. The relative difficulty of the film strips, evaluated by different means, gives clues as to film-strip characteristics influencing difficulty. The results are considered preliminary to a fruitful approach to construction of visual instructional materials.—*S. S. Marsolf*.

3815. Neidt, Charles O., & French, Joseph L. (U. Nebraska) **Reaction of high school students to television teachers.** *J. genet. Psychol.*, 1962, 100 (2), 337-344.—Both quantitative and qualitative data were obtained indicating that the majority of students preferred the classroom condition to the television condition when the same teacher is available. Apparently, the most influential factor contributing to unfavorable attitudes toward television is the lack of intercommunication between teachers and students.

The conclusions of this study may be summarized as follows: although high school students prefer conventional classroom instruction to television-correspondence instruction, it is not because they perceive the characteristics of the teacher differently in the 2 situations, but because of factors inherent in the instructional television situation.—*Author abstract*.

3816. Reid, R. L. (U. Aberdeen) **Aspects of programmed learning.** *Bull. Brit. Psychol. Soc.*, 1962, 48, 10-15.—A general introduction to the subject illustrated by the author's experiences in developing several linear programs for use in diverse fields.—*C. C. Kiernan*.

3817. Royds, A. (U. Manchester) **Intelligibility of school television programmes.** *Brit. J. educ. Psychol.*, 1962, 32(2), 159-165.—383 Ss, aged 8-14, made "free-writing" statements following one of a group of TV programs. Word counts and counts of statements were compared to words and statements in the scripts. TV material was verbally intelligible, one reason being that it approximated the standards of the children's own language.—*B. T. Jensen*.

3818. Weckin, Stanley. (Edward R. Johnstone Training & Research Cent., Bordentown, N. J.) **Word learning in an automated teaching situation as a function of display condition.** *J. educ. Psychol.*, 1962, 53(4), 165-169.—An experiment was conducted to ascertain the more efficient mode of presenting materials for word learning in a multiple choice automated teaching situation. Using 32 delinquent Ss, it was found that a situation in which visual response alternatives were coupled with an auditory stimulus faster learning ($p < .001$) and consequent better retention than one using auditory response alternatives to visual stimulus. These results were attributed to differential fading of the stimulus trace. Differential transfer ($p < .01$) in the 2 conditions was attributed to degree of completed learning.—*Journal abstract*.

3819. Willey, C. F. (Norwich U.) **Objective scoring of the completion test.** *Psychol. Rep.*, 1962, 10(2), 501-502.—A description of how a coded index can be used with completion items in programmed instruction or in testing to provide objective scoring.—*B. J. House*.

ATTITUDES & ADJUSTMENT

3820. Adinarayan, S. P., & Rajamanickam, M. (Annamalai U, South India) **A study of student attitude toward religion, the spiritual and the supernatural.** *J. soc. Psychol.*, 1962, 57(1), 105-111.—3 tests were used—Vetter's Attitude Scale, Krishnan's Questionnaire for Cyclothymes-Schizothymes, and a Questionnaire on Religion consisting of 30 items regarding the nature of God, future life, priests, the spirit world, personal religion, and formal religion. The Ss, 300 in number, were all students of the Annamalai University. An important finding was the positive correlation between religious attitude and radicalism-conservatism attitude (+.477). There was no significant relationship between religious attitude and personality types. Students coming from high income groups were more religious than the students coming from low income groups. The city student group was more religious than the town group, and the town group more than the village group. In student religion, prayer, sacred books, communal worship, and festivals play a more important part than

priests, the future live, and the spirit world.—*Author abstract.*

3821. Behar, L., & Altrocchi, J. (Duke U.) Agreement on the concept of the ideal therapist as a function of experience. *J. clin. Psychol.*, 17(1), 1961, 65-69.—A partial replication of Fiedler's study (see 25: 2483) reported earlier was attempted in asking 65 nurses, varying in experience in psychiatric nursing therapy, to describe the ideal psychiatric nursing therapist. The nurses were divided into 4 groups according to their experience; they also were asked, as a control question, to describe the ideal female high school teacher. Evaluation of the Q-sort results showed that agreement significantly increased with increased experience. However, Ss tested immediately after an intensive training period showed a temporary confusion in their role concept and their description of the ideal psychiatric nursing therapist. No appreciable differences were evident among the 4 groups in agreement on concept of an ideal high school teacher.—*V. J. Biliuskas.*

3822. Carney, Richard Edward. (U. Michigan) An analysis of university student behaviors with measures of ability, attitude, performance and personality. *Dissert. Abstr.*, 1961, 22(6), 2073.—*Abstract.*

3823. Cox, F. N. (U. Melbourne, Australia) Educational streaming and general and test anxiety. *Child Develpm.*, 1962, 33(2), 381-390.—The Yale General and Test Anxiety scales were administered to 266 children attending 4th and 5th grades. The children had been subdivided into superior and inferior subgrades on the basis of their performance in the 1st 3 grades. 3 hypothesis were tested: The correlation between the 2 scales would be positive, the correlation between subgrade level and test anxiety would be negative, and general anxiety scores would be independent of educational streaming practices. The results were consistent with these expectations.—*W. J. Meyer.*

3824. Davidson, Helen H., Riessman, Frank, & Meyers, Edna. (City Coll., N. Y.) Personality characteristics attributed to the worker. *J. soc. Psychol.*, 1962, 57(1), 155-160.—The hypothesis was that persons in higher occupational categories would be rated more positively in personality characteristics than persons in the lower occupational groups. The Ss were 241 undergraduate students, males and females, attending classes in psychology and education. They varied in social class background. A checklist of 30 personality characteristics, with regard to 5 selected occupational groups was used. Before checking the list of characteristics, the students were asked to give a brief personality description of the individual who had been described to them using Asch's technique. The occupational groups differed significantly in 12 of the 30 characteristics. Positive characteristics: industrious, practical, thoughtful, serious, polite, confident, cautious, intelligent, were distributed about equally among the factory owner, assistant office manager, teacher, and physician. The worker emerged as having the lowest mean score for all these qualities. More negative characteristics were attributed to factory workers than to any of the other occupational groups.—*Author abstract.*

3825. Defares, P. B., Kema, G. N., & van der Werff, J. J. Voorkeursstructuur van beroepen bij de overgang naar het vervolgonderwijs. [Prefer-

ence for professions before enrolling for higher education.] *Mens Onderneming*, 1962, 16(3), 159-172.—The findings of 2 factor-analyses, based on correlations between scores representing preference for professional careers, were compared with theoretical points of view. Experiments included 195 boys and 198 girls and revealed 4 factors which indicated different groups of professions. The data for boys could be interpreted in terms of status and knowledge required, whereas girls seemed to prefer specific forms of "taking care" of other people.—*J. A. Lückers.*

3826. Dipboye, W. J., & Anderson, W. F. (Syracuse U.) Occupational stereotypes and manifest needs of high school students. *J. counsel. Psychol.*, 1961, 8(4), 296-304.—High school seniors rated 8 occupations on 14 of Edwards' manifest needs. Significant differences occurred in stereotypes. Sex differences were minimal. Need satisfaction in occupation is discussed.—*E. R. Oetting.*

3827. Ferullo, Robert Joseph. (Boston U.) A Q-technique study of the self-concepts of two groups of college students varying in degree of speaking ability. *Dissert. Abstr.*, 1961, 22(3), 914.—*Abstract.*

3828. Furst, Edward J., Raygor, Alton W., & Crofoot, Alan P. (Ohio State U.) Basic motivation and concept of nursing as chosen profession. *J. Psychol.*, 1962, 54(1), 85-100.—The hypothesis was tested that the profession an individual chooses is the one which, according to his concept of it and as he imagines himself in it, seems to him to satisfy most fully his strongest needs. A motivational and a concept sketch were accordingly outlined for 20 student nurses. The corresponding sketches were then compared and the concept sketch rated on need-fulfillment. The mean rating was considered to support the hypothesis well. Further support came from the correlation between the ratings and certainty of choice of profession. Case material was presented to illustrate relationships between personality and concept, and to explore important developmental influences.—*Author abstract.*

3829. Gaito, John. (Kansas State U.) A potential indicator of college motivation. *Psychol. Rep.*, 1962, 10(2), 393-394.—"Exploratory research with a simple test of 'college motivation' is discussed. The test was successful in predicting grade-point average at one institution but unsuccessful at a second college."—*B. J. House.*

3831. Gibbs, N. L., Kirman, B. H., Reed, M., Stephen, E., & Clarke, A. D. B. (Child Guidance Training Centre, Osnauburgh St., London, England) Handicapped school leavers. *Bull. Brit. Psychol. Soc.*, 1962, 47, 43-55.—A summary of the evidence on the needs of handicapped school leavers and on the facilities provided for them in Britain, with recommendations toward the improvement of their position.—*C. C. Kiernan.*

3832. Goldstein, Michael J., & Davis, Diane. (U. California, Los Angeles) The impact of stimuli registering outside of awareness upon personal preferences. *J. Pers.*, 1961, 29(3), 247-257.—"The role of stimulus awareness in modifying choice be-

havior was investigated. High school Ss were required to choose between pairs of faces the one preferred for class officers. The control group ($N=42$) made their choices without any incidental stimulation. . . . The experimental group ($N=278$) received incidental stimulation of the words GOOD and BAD beneath one picture in each pair in flashes of 1 msec. at a rate of 1 per sec. Of the experimental Ss 32 percent reported awareness of the words; 68 percent did not. . . . (a) For the preferred pictures, words of which S was aware influenced choices but words of which S was unaware did not. (b) For non-preferred pictures, the same trend was present except that where compliance was found with preferred pictures under conditions of awareness, negative influence was found with nonpreferred pictures under the awareness condition."—G. T. Lodge.

3833. Hobart, Charles W. (U. Redlands) **The pregnant high school girl: An analysis and a proposal.** *Personnel Guid. J.*, 1962, 40(9), 786-790.—A program is suggested which would permit pregnant high school girls to complete their studies, which would include a course on home arts for young mothers, provide training in making a suitable home, and establish a reference group with which the girl can identify.—S. Kavruck.

3834. Ikenberry, Stanley O. (Michigan State U.) **Factors in college persistence.** *J. counsel. Psychol.*, 1961, 8(4), 322-329.—A discriminant analysis of 7 variables for 1st-year college persistence, achievement, and sex. The 1st function weighted heavily the College Qualification test, Michigan State University Reading Test, Test of Critical Thinking, and a social status score from parents' education and father's occupation. The 2nd function is interpreted as a cultural sex function. Inventory of Belief, Differential Values inventory, and Rokeach's Dogmatism Scale show minimal weighting.—E. R. Oetting.

3835. Lamy, Richard Emile. (U. Oregon) **Conceptions of maladjustment and mental illness among college undergraduate students.** *Dissert. Abstr.*, 1961, 22(5), 1717.—Abstract.

3836. Lichter, Solomon O., Rapien, Elsie B., Seibert, Frances M., & Sklansky, Morris A. (Scholarship & Guidance Ass., Chicago) **The drop-outs.** New York: Free Press Glencoe, 1962. xiii, 302 p. \$5.50.—The experiences and findings of a 3-year treatment study of a group of intellectually capable Chicago youngsters who wanted to leave or who left high school. A substantial number were handicapped by their own emotional difficulties and those of their families. Usefulness of prolonged counseling and importance of early diagnosis are illustrated. It is suggested that school can take on special psychodynamic meaning of a conflictual nature. It demonstrates how teachers, parents, counselors, and community can cooperate to reduce drop-outs and salvage valuable human potential.—C. H. Miley.

3837. McClintock, Charles G., & Turner, Henry A. (U. California, Santa Barbara) **The impact of college upon political knowledge, participation, and values.** *Hum. Relat.*, 1962, 15(2), 163-176.—Questionnaires on political knowledge and involvement were given to 661 freshmen and seniors from 10 California colleges. With controls on sex and grade average, no significant differences were found. Secondary analyses showed that students who identi-

fied themselves as Democrats did not differ markedly from those identifying themselves as Republicans. "And finally, differences in level of participation in college activities among seniors related to level of high-school participation for both males and females, and to anticipated political involvement for females, but not to any of the other dependent measures of political knowledge, involvement, and ideology."—W. W. Meissner.

3838. McDonald, Robert L. (South Carolina State Hosp.) **Personality characteristics of freshman medical students as depicted by the Leary system.** *J. genet. Psychol.*, 1962, 100(2), 313-323.—The Leary Interpersonal System was used to analyze MMPIs and Interpersonal Check Lists obtained from 64 freshman medical students. These results were compared with other normative data for the public interpersonal level (I-S) and the level of underlying character structure (III-MM). 91% of the medical students presented healthy, symptomatic behavior and 81% described themselves as responsible, generous, managerial persons in interpersonal situations. Characterologically 85% had underlying managerial, competitive, responsible feelings. In spite of the large percentages of "healthy" behavior at this level and the "facade" level, the most frequent Ideal of these students was to be a critical-sadistic person. These interlevel conflicts point to the possibility of future poor adjustment on the part of many of the students.—Author abstract.

3839. Mehman, Benjamin. (Kent State U.) **Similarity in friendships.** *J. soc. Psychol.*, 1962, 57(1), 195-202.—Independent pairs of "Very Best Friends," "Friends," and "Enemies" were identified on a college campus and were administered the Edwards Personal Preference Schedule and a "Friendship Rating Scale" to determine whether there is similarity or complementarity in such relationships. A few statistically significant positive correlations were found for all groups for the PPS data, and a considerably greater number of significant correlations for the rating scale data, with agreements in perception of the relationships characteristically found for the first 2 groups and disagreements for the "Enemy" group. These data were interpreted as less than compelling evidence for general tendencies toward either similarity or complementarity in friendships, and some speculations regarding Riesman's other-directed individual were offered.—Author abstract.

3840. Morse, W. C. (U. Michigan) **Perceptions of class-room mental health, group process and learning from diverse points of view.** *Percept. mot. Skills*, 1962, 14(3), 390.—Teacher, pupil, and observer perceptions of mental health, learning, and democratic group process were secured from 30 public school classrooms. Teachers responded on a psychophilosophical value, 40-statement forced-rank device, made open-ended responses to classroom situations, and rated their present classes. Over 700 pupils responded on a 214-item questionnaire. Trained psychologists made classroom observations. Pupils and observers tend to view mental health, substantive learning, and democratic group process as interrelated in the classroom while the teacher does not. Examination of individual classrooms shows idiosyncratic patterning of these properties.—W. H. Guertin.

3841. Murray, John B. (St. John's U.) College students' concepts of psychologists and psychiatrists: A problem in differentiation. *J. soc. Psychol.*, 1962, 57(1), 161-168.—Some reasonably accurate delineations of the role and background of psychiatrist and psychologist emerged from testing a group of 137 college students. However, there were strange overlaps of the 2 roles. Moreover, prominent functions of the psychologist, such as work with individuals as opposed to groups, were overlooked.—*Author abstract.*

3842. Panda, K. C., & Kanungo, R. N. (Ravenshaw C., Cuttack, India) A study of Indian students' attitude towards the motion pictures. *J. soc. Psychol.*, 1962, 57(1), 23-31.—The purpose of this study was (a) to construct a scale for measuring attitude towards the motion pictures, (b) to ascertain the existing attitudes of Indian students by using this scale. A movie attitude scale of Thurstonian type was constructed and given to 385 students from schools and colleges of Orissa. A comparative analysis was made of the attitudes of students in regard to their sex, educational level, and chronological age. The findings were: students in general showed favorable attitudes towards the motion pictures. The male students' attitudes were significantly more favorable than those of females. Sex difference in attitude scores seemed to be more evident at the college level than at the higher secondary level (not statistically significant). College students' attitudes were significantly more favorable than those of the higher secondary students.—*Author abstract.*

3843. Panda, K. E., Das, J. K., & Kanunge, R. N. (Utkal U., Ravenshaw Coll., Cuttack, India) A cross-cultural study of film preferences on an Indian student population. *J. soc. Psychol.*, 1962, 57(1), 93-104.—The main objective of this investigation was to make a comparative analysis of students' (a) film preferences, and (b) determinants of film preferences with respect to sex, age, and educational background. The problem was investigated through a direct questionnaire technique. The results obtained were: students in general preferred most social films, next family pictures, scientific pictures, and so on. Romantic and love films were strikingly less popular among the Indian students. Films which were educative, information giving, and instructive were preferred more by the higher secondary students. College student's preference centered around the films of human relationships. Film preferences of students of the lower age group (below 18 years) were significantly different from the higher age group (18 years and above). Natural scenery, music, humor, and pathos were the most emphasized determinants of student preferences. Significant differences in determinants of preferences were obtained between male and female and higher secondary and college students. The effect of age on the determinants of film preference was small.—*Author abstract.*

3844. Payne, David A., & Farquhar, William W. (Michigan State U.) The dimensions of an objective measure of academic self-concept. *J. educ. Psychol.*, 1962, 53(4), 187-192.—Following from the assumption that a student's self-concept is a functionally limiting and facilitating factor in academic performance which interacts with motivation, a 119-item instrument (the Word Rating List) was developed. The instrument was a subtest of an objec-

tive motivational test battery (the M scales). Student's rated 1-, 2-, or 3-word concepts on a 4-point scale as they thought their teachers would in describing them as students. Item discrimination was determined by chi square analyses of the responses of statistically defined under- and over-achieving 11th graders. 48 items remained after cross-validation for each sex, with 35 in common, which had Hoyt's analysis of variance reliabilities in the .90s. Multiple scalogram analysis yielded a global dimension for both males and females. Additionally, 3 male and 4 female interpretative dimensions were found.—*Journal abstract.*

3845. Parida, Gurupada. (Ravenshaw Coll., Cuttack, Orissa, India) Superstitions among college students. *J. soc. Psychol.*, 1962, 57(1), 3-10.—Attitude changes towards superstitions of a group of university students coming from a backward part of India. The purpose of the study was to observe the influence of college training on their superstitious beliefs and practices. The findings indicate that students, irrespective of the year in college or their major area of study, all maintained the same degree of belief in the superstitions. Background characteristics such as place of birth, town or village, family occupation, major field of study in the college of arts or science, were not significant predictors of differences in either beliefs or practices of superstitions.—*Author abstract.*

3846. Schutz, Richard E., Staats, Arthur W., & Staats, Carolyn K. (Arizona State U.) Conditionability of responses to occupational scale items of the Strong Vocational Interest Blank for men. *Psychol. Rep.*, 1962, 10(2), 447-450.—As a test of the hypothesis that vocational interests form a homogeneous response class, an attempt was made to condition, by verbal reinforcement, responses which either corresponded to or were in opposition to selected scales. 80 12th-grade boys were given either the "Physician (Rev.)" or the "Carpenter" scale of the Strong test. Failure to obtain evidence of conditioning was contrasted with previous successful conditioning with personality scales.—*B. J. House.*

3847. Singh, Paras N., Huang, Sophia C., & Thompson, George G. (Ohio State U.) A comparative study of selected attitudes values, and personality characteristics of American, Chinese, and Indian students. *J. soc. Psychol.*, 1962, 57(1), 123-132.—37 American, 37 Chinese, and 37 Indian students attending an American university responded to the following questionnaires: the Allport-Vernon-Lindzey, Morris' Ways to Live, Sanford and Older's AE Scale, and Edwards' Personal Preference Schedule. The following differences were found: (a) American students were more self-centered while both Chinese and Indian students were more society-centered; (b) American students were more theoretical than the other groups; (c) Indian students were more politically and economically oriented than the other groups; (d) Indian and Chinese students were more authoritarian than American students; (e) American students were more religious than the other groups; and (f) Indian and Chinese students showed a greater preference for enjoying life through group participation, while American students preferred the many-sided, flexible approach to the good life.—*Author abstract.*

3848. Turner, Ralph H. (U. California, Los Angeles) Some family determinants of ambition.

Sociol. soc. Res., 1962, 46(4), 397-411.—Several hypotheses regarding family determinants of ambition were tested on the basis of questionnaire data from 2175 nonethnic high school seniors in Los Angeles. High ambition and a relative emphasis on the educational rather than material component of ambition were found to be associated with high breadwinner's education relative to occupation, higher mother's than father's education, and a small family. Level but not emphasis in ambition may be related to family stability. Position and sex of siblings were unrelated to ambition when controls were introduced for family size.—*Journal abstract*.

3849. Zeitlin, Herbert. High school discipline: 442 teachers report on disciplinary problems in seven Phoenix high schools. *Calif. J. educ. Res.*, 1962, 13(3), 116-125.—A 1-year total of 14,251 misbehavior citations on a student body of 12,023 is reported in terms of 12 categories: disturbance, disobedience, disrespect, misrepresentation, ignoring health and safety factors, smoking, fighting, property damage, profanity and obscenity, gambling, theft, and cheating. 82.5% fall in the first 3 categories. The reported misbehaviors are considered in terms of 13 questions, per cent of student body being so reported (49), differences among schools and among ethnic groups, sex differences, and the like.—*T. E. Newland*.

SPECIAL EDUCATION

Reading

3850. Copple, Lee Biggershaff. (Vanderbilt U.) Motor development and self-concept as correlates of reading achievement. *Dissert. Abstr.*, 1961, 22(4), 1241.—*Abstract*.

3851. Downing, J. A. (U. London) The relationship between reading attainment and the inconsistency of English spelling at the infant's school stage. *Brit. J. educ. Psychol.*, 1962, 32(2), 166-177.—After referring to reports of previous use of simplified spelling and transition to regular spelling, the author briefly describes the augmented roman alphabet.—*B. T. Jensen*.

3852. McLeod, J. (U. Queensland) The estimation of readability of books of low difficulty. *Brit. J. educ. Psychol.*, 1962, 32(2), 112-119.—In Study I 255 children read materials from different texts with word recognition as the criterion, error on more than 3 words indicated unreadability for that child. Reading age of each S was assessed by another test. In Study II 375 children, tested for ability to comprehend, read passages from texts and answered questions. While agreeing fairly well with estimates by readability formula on 3 books, this empirical test gave different results on a more difficult book.—*B. T. Jensen*.

3853. Otto, W., & Lasswell, A. (U. Oregon) Relationship of secondary beginning strokes in handwriting to reading ability. *Percept. mot. Skills*, 1962, 14(3), 530.—Secondary beginning strokes (SBS) is the initial upstroke in handwriting frequently found on words beginning with lower case u, v, w, and y. Previous work reports a relationship between SBS and personal adequacy. This study showed poor readers used a significantly greater number of SBS than the good readers.—*W. H. Guertin*.

3854. Vernon, M. D. (U. Reading) Specific dyslexia. *Brit. J. educ. Psychol.*, 1962, 32(2), 143-

150.—Those with reading disabilities must be studied as individuals. Some have difficulties not caused by emotional factors—specific dyslexia.—*B. T. Jensen*.

3855. Vernon, Philip E. (U. London) The determinants of reading comprehension. *Educ. psychol. Measmt.*, 1962, 22(2), 269-286.—To determine the relative variance of test content, method, and error components, parallel forms of 7 specially constructed vocabulary and reading tests were administered to 108 British and 75 American college students. Although the results did not support Vernon's belief that method factors would have the strongest influence, higher validities were obtained with a reading test employing an unconventional method. "Centroid factor analyses revealed a strong Comprehension factor, orthogonal to the Vocabulary factor, among both groups in the reading tests." Several general observations are also offered.—*W. Coleman*.

Mental Retardation

Gifted Students

3856. Cassel, Russell N., & Hendsch, Gene. (Lompoc Unified School District, Calif.) A comparative analysis of occupational interest scores between gifted and typical 5th grade pupils. *J. Psychol.*, 1962, 54(1), 241-244.—This study was concerned with making a comparative analysis between scores from 2 occupational interest inventories (the Picture Interest Inventory and the Occupational Interest Inventory both published by the California Test Bureau) for 30 gifted and 34 typical 5th-grade pupils. No statistically significant occupational interest differences were found between gifted and typical 5th-grade pupils as measured by referenced inventories. The discriminant function multiple point bi-serial R_c (corrected for shrinkage) for the 1st inventory was $.166 \pm .131$, and for the 2nd $.252 \pm .128$. No significant differences were obtained between the Ms for the part scores on either inventory for the 2 groups.—*Author abstract*.

3857. Lesser, Gerald S., Davis, Frederick B., & Nahemow, Lucille. (Hunter Coll.) The identification of gifted elementary school children with exceptional scientific talent. *Educ. psychol. Measmt.*, 1962, 22(3), 349-364.—2 forms of a 91-item science aptitude test were constructed for the identification of science talent in elementary school children. "The items included in these tests were designed to measure (1) the ability to recall scientific information, (2) the ability to assign meaning to observations, (3) the ability to apply scientific principles in making predictions, and (4) the ability to use the scientific method." The tests were administered at the beginning of the school year and the scores were compared with scores on 7 science achievement tests given at the end of each unit during the school year. The predictive r 's were .77 and .71 for the 2 forms. The parallel forms reliability of the aptitude tests was .64 and the reliability of the composite achievement test was .82.—*W. Coleman*.

EDUCATIONAL GUIDANCE

3858. Blocher, Donald H., & Schutz, Richard A. (U. Minnesota) Relationships among self-descriptions, occupational stereotypes, and vocational preferences. *J. counsel. Psychol.*, 1961, 8(4), 314-317.—Self- and ideal-self-concept on a descriptive

check list are more similar to a high interest occupational stereotype than to the stereotype of an occupation rated by the high school senior boys as being of low interest.—*E. R. Oetting.*

3859. Coelho, G. V., Silber, E., & Hamburg, D. A. (National Inst. Mental Health.) **Use of the student TAT to assess coping behavior in hospitalized, normal, and exceptionally competent college freshmen.** *Percept. mot. Skills*, 1962, 14(3), 355-365.—A Student-TAT, consisting of 10 ambiguous college situations, and a simple reliable scoring method, were developed to measure coping behavior by the student in stressful college freshman situations. The test, given to 3 groups of college freshmen, decisively differentiated between a clinically disturbed group and 2 normal groups. Research is now in progress to test the uses of the Student-TAT in predicting gross student vulnerability among college freshmen shortly before they enter college.—*W. H. Guertin.*

3860. Davis, Donald A. (Western Michigan U.) **An experimental study of potential dropouts.** *Personnel Guid. J.*, 1962, 40(9), 799-802.—A combination of factors including early identification of potential dropouts, establishment of friendly pupil-staff relationships, use of consultants, field trips, and counseling has resulted in: a decrease in the rate of dropout, better marks, and fewer referrals for discipline.—*S. Kavruck.*

3861. Eells, Kenneth. (Student Health Cent. California Inst. Technology) **A vivid method of presenting chances for academic success.** *J. counsel. Psychol.*, 1961, 8(4), 344-350.—A graphic method of demonstrating chances of success in college to beginning students is discussed.—*E. R. Oetting.*

3862. Goodstein, Leonard D., & Crites, John O. (State U. Iowa) **Brief counseling with poor college risks.** *J. counsel. Psychol.*, 1961, 8(4), 318-321.—33 students were in study and control groups. "There was no evidence that vocational educational counseling as it is usually conducted leads to greater academic achievement by low ability college students."—*E. R. Oetting.*

3863. Lloyd, David O. (Mesa Public Schools, Ariz.) **Counselor and counselor trainer attitudes toward counselor certification in the United States.** *Personnel Guid. J.*, 1962, 40(9), 791-798.—Based on opinions of members of the National Association of Guidance Supervisors and Counselor Trainers and members of the American School Counselor Association, 8 specific recommendations concerning counselor certification are suggested. Research should be directed towards the adequacy of the opinions expressed and to their implementation.—*S. Kavruck.*

EDUCATIONAL MEASUREMENT

3864. Baugh, Verner S., & Robinowitz, Ralph. (VA Hosp., Waco, Tex.) **Admission testing program.** *J. genet. Psychol.*, 1962, 100(2), 309-312.—Because of the increased admissions and shortage of personnel, the need arose for some type of psychological evaluation other than individual testing. Therefore, an Admissions Testing Program was begun. The following areas of appraisal are covered: behavioral observation, evaluation of mental functioning, including estimation of the intellectual level, concept formation, and areas of impairment in thinking

and perception; salient features of the personality, attitudes and conflicts, personality disturbances leading to psychodiagnostic impression, recommendations for treatment and/or planning where possible. The test battery consists of Kent E-G-Y Oral Emergency, an original Picture Completion Test, Visual Motor Gestalt, Draw-A-Person, and the Rotter Sentence Completion. Tests are administered to small groups of between 6-15. The approach to group test interpretation is the same as that towards individual evaluative material.—*Author abstract.*

3865. Bonnardel, R. **Recherche sur les concours d'entrée aux grandes écoles.** [Study of entrance examinations for schools of higher education.] *Travail hum.*, 1962, 25(1-2), 29-48.—About 10 years ago, the correlation between scores on entrance examinations and final grades was .38. But with greater numbers of applicants and higher admission standards, it has dropped to .02. The author finds that the more "classical" subject matter tends to choose the more studious applicants.—*R. W. Husband.*

3866. Dressel, Paul L. (Chrmn.) **Proceedings of the Invitational Conference on Testing Problems, 1961.** Princeton, N. J.: Educational Testing Service, 1962. 108 p.—10 papers presented at the conference are reproduced in this publication. The contribution of factor analytic studies to the understanding and improvement of achievement measurement was discussed by J. B. Carroll in "Factors of Verbal Achievement," J. W. French in "Schools of Thought in Judging Excellence of English Themes," and L. R. Tucker in "Factor Analysis of Relevance Judgments: An Approach to Content Validity." The use of achievement tests for awarding course credit was covered by J. N. Arbolino, Ruth D. Churchill, E. G. Erickson, and W. G. Warrington. John E. Ivey spoke on "The Management of the Learning Environment," and Dewey B. Stuit outlined means for measuring the quality of a college or university. The final paper on "The Nature and Use of Institutional Research" was given by J. I. Doi.—*W. Coleman.*

3867. Feldhusen, John F., & Klausmeier, Herbert J. (Wisconsin State Coll.) **Anxiety, intelligence, and achievement in children of low, average, and high intelligence.** *Child Developm.*, 1962, 33(2), 403-409.—"Forty children with WISC IQs of 56 to 81, 40 children with WISC IQs of 90 to 110, and 40 children with WISC IQs of 120 to 146, divided equally by sex in each group, were used as Ss in an analysis of the relationship of anxiety, as measured by the Children's Manifest Anxiety Scale, to IQ and achievement." Girls had significantly higher anxiety scores than boys; the Low IQ group had significantly higher anxiety scores than the average or superior IQ groups who did not differ from one another; the *r*'s between anxiety and achievement for the low and average IQ Ss were negative.—*W. J. Meyer.*

3868. Francesco, E. (Middleton, Wis.) **Below chance performance on a verbal test: A replication.** *Psychol. Rep.*, 1962, 10(2), 601-602.—"Data are presented for a sample of 152 male Ss to illustrate performance on the VPT [Verbal Power Test of Concept Equivalents] below the manifest chance level."—*B. J. House.*

3869. Haney, Russell; Michael, William B., & Gershon, Arthur. (U. Southern California) **Achievement, aptitude, and personality measures as predictors of success in nursing training.** *Educ. psy-*

chol. Measmt., 1962, 22(2), 389-392.—With a sample of 82 freshmen trainees, the California Reading and Math tests, 5 parts of the Employee Aptitude Survey Tests, and the MMPI were used as predictors. High school grade average in academic courses and high school chemistry grades were also used as predictors. 5 criteria measures were employed ranging from class grades to ratings of ward performance. Highest r between the 25 predictor variables and the 5 criterion measures was .43 between high school chemistry and microbiology. Significant negative r 's were obtained between the Hs and Pd scales of the MMPI and several of the criteria measures.—*W. Coleman.*

3870. Lewis, John W. (Southern Illinois U.) Comparing zero-order correlation from SCAT total and multiple correlations from SCAT Q and V at Southern Illinois University. *Educ. psychol. Measmt.*, 1962, 22(2), 397-398.—Although the multiple R did account for more criterion variance than the zero-order r , the differences were not thought to be statistically significant as no allowance for shrinkage had been made. The sample involved 1998 freshmen students at Southern Illinois University.—*W. Coleman.*

3871. Lewis, John W. (State U. Iowa) Utilizing the stepwise multiple regression procedure in selecting predictor variables by sex group. *Educ. psychol. Measmt.*, 1962, 22(2), 401-404.—A battery of 11 predictor variables was used to predict first quarter grade point average by sex group. SCAT total yielded the largest r with the criterion. "SCAT Total, high school rank, and Co-operative English Grammar accounted for all but .02 of the explained male criterion variance and all but .01 of the explained female criterion variance." The multiple R for males was .48 and .64 for females.—*W. Coleman.*

3872. Michael, William B., Jones, Robert A., Cox, Anna; Gershon, Arthur; Hoover, Marvin; Katz, Kenneth, & Smith, Dennis. (U. Southern California) High school record and college board scores as predictors of success in a liberal arts program during the freshman year of college. *Educ. psychol. Measmt.*, 1962, 22(2), 399-400.—For 422 liberal arts freshmen at the University of Southern California, high school grade average was more predictive of success in college than either part or total scores of the CEEB. The multiple R for the combined predictors was only slightly higher. The r 's for the women students were higher than the r 's for the men.—*W. Coleman.*

3873. Rapier, Jacqueline L. Measured intelligence and the ability to learn. *Acta psychol., Amsterdam*, 1962, 20(1), 1-7.—Woodrow's review of experimental evidence challenged the belief in the inherent relation of intelligence and learning, but measures of learning in school and laboratory do not support this conclusion. Weaknesses in methodology presumably underlie the results on which Woodrow bases his conclusion. New approaches include the use of subnormals, more precise studies of individual differences, the learning process itself, and a broadening of the knowledge of intelligence.—*G. Rubin-Rabson.*

3874. Shanker, Prem. (U. Washington) The contribution of EPPS scores to differential and multiple absolute academic prediction. *Dissert. Abstr.*, 1961, 22(6), 2065.—*Abstract.*

3875. Verhaegen, P. (Centre Psychologie Pédagogie, Elisabethville, Katanga, Congo) Possibilité d'une orientation scolaire basée sur des épreuves psychologiques chez des enfants africains. [Possibility among African children of educational guidance based on psychological tests.] *Rev. Psychol., appl.*, 1962, 12(2), 123-133.—Over a period of years follow-up studies were made of students examined in Katanga by the Psychological Centre to determine the predictive validity for secondary school marks of scores earned on various psychological tests. In general the correlations were in the .40s and .50s. It was concluded that tests developed on a specific population may not be of great use in a different group. When a study was made of the predictive efficiency for different classes it was found that the weakest correlations appeared for classes where the teacher seemed unable to stimulate the pupils. This would seem to indicate that psychological tests function usefully only for well-run schools.—*W. W. Wattenberg.*

3876. Wolfson, W., & Lo Cascio, R. (Middletown State Hosp.) Digit symbol performance of nursing school applicants. *J. clin. Psychol.*, 1961, 17(1), 59.—The digit symbol raw scores of 29 female nursing school applicants, age 18, were compared with Wechsler standardization samples. Then the W-B Digit Symbol weighted scores of 68 female applicants of 17-19 years of age were compared to the Wechsler standardization population for that test. The findings failed to support Wechsler's assumption concerning the inferior functioning of nursing school applicants on the Digit Symbol test.—*V. J. Bieliauskas.*

Aptitudes

3877. Andrews, Dorothy E. (Winona State Coll.) Comparative study of two methods of developing music listening ability in elementary school children. *J. Res. music Educ.*, 1962, 10, 59-64.—28 5th-grade Ss, exposed to a self-initiated listening experience with phonograph, earphones, and supplementary visual materials, developed more positive attitudes toward music than control Ss who were given a group listening period and discussion of information about the composers. However, an equal amount of factual information was learned with either method.—*D. S. Higbee.*

3878. Gordon, Edwin. (State U. Iowa) A study to determine the effects of training and practice on Drake Musical Aptitude Test scores. *J. Res. music Educ.*, 1961, 9, 63-74.—10 9th grade Ss were tested before and after 20 ½-hour periods devoted to training and practice of musical phrases similar to those used in the test. Posttest scores showed improvement, though not to a significant degree; but 10 control Ss showed a similar trend.—*D. S. Higbee.*

3879. Jones, Reginald L. (Miami U.) A study of the validity of the pre-engineering ability test. *Educ. psychol. Measmt.*, 1962, 22(2), 393-396.—The Pre-Engineering Ability Test (PEAT) and the American College Test (ACT) were administered to 68 pre-engineering students at a midwestern state university. Criteria were first semester grade-point average, chemistry grade, and math grade. PEAT and ACT were about equally effective in their predictive ability with r 's ranging from .47 to .72.—*W. Coleman.*

3880. Lepez, R., & Kourovsky, F. *Les test d'acquisitions scolaires 5e-4e.* [Scholastic aptitude tests for the fifth and fourth forms.] *Rev. Psychol. appl.*, 1962, 12(2), 105-122.—A description is given of a test battery designed to measure scholastic aptitude in the 5th and 4th forms of French schools. This consists of tests of French, Latin, mathematics, and modern languages. Data are given as to standardization.—*W. W. Wattenberg.*

3881. Repina, T. A. (Inst. Psychology, RSFSR Acad. Pedagog. Sciences) *O nekotorykh metodikakh izucheniia zvukovystnoi chuvstvitel'nosti u detei doshkol'nogo vozrasta: Soobshchenie II. Differentsirovka chistykh tonov v usloviakh opredmechvaniia.* [Some procedures of studying the sound pitch sensitivity in preschool children: Communication II. Differentiation of pure tones under conditions of objectivation.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 5, 69-72.—20 children (age 3-5) were trained to discriminate pure tones representing animal's voices (a 250 cycle tone was a "bear's voice," a 400 tone was a "dog's voice," and a 1500 tone was a "chicken's voice"). Ss who previously had been found to be "pitch deaf" were able to discriminate the 2 extreme tones, the older Ss, even the middle tone.—*A Cuk.*

Achievement

3882. Aliferis, James, & Stecklein, John E. *Aliferis-Stecklein Music Achievement Test: College Midpoint Level manual.* Minneapolis, Minn.: Univer. Minnesota Press, 1962. 36 p. \$3.75.—The college midpoint level test "measures, at the end of the sophomore year or the beginning of the junior year, the music student's power of auditory-visual discrimination of melodic intervals, chords, and rhythms. The test is given from the piano or by pre-recorded tape and lasts approximately 45 minutes." An 8-page test booklet and scoring instructions accompany the manual.—*E. L. Borrowman.*

3883. Fink, Martin B. (Mt. Diablo, Calif.) *Objectification of data used in underachievement-self concept study.* *Calif. J. educ. Res.*, 1962, 13(3), 105-112.—Further analyzing the data obtained in an earlier study (see 37:2008) it was found that at the .05 level of confidence or better, 48 items on the California Psychological Inventory were found to discriminate between high- and low-achieving boys, 23 between high- and low-achieving girls, and 72 between high- and low-achieving boys and girls. The nature of these items "would appear to support the judges' decisions as to adequacy or inadequacy of self-concept." The Ac (Achievement-conformance) and So (Socialization) scales of the CPI appear to be valid achievement discriminators.—*T. E. Newland.*

3884. Gega, Peter C., & Karlsen, Bjorn. (San Diego State Coll.) *Situational vs. non-situational casting of items in the STEP: Elementary science.* *Calif. J. educ. Res.*, 1962, 13(3), 99-104.—The regular science test (Grades 4 through 6) and an experimental form of it, with situational references "largely deleted," were administered to 344 5th- and 6th-grade children. The results obtained under the 2 conditions were not statistically significantly different. Implications of the findings, as for instance in regard to increasing the number of test items, are discussed.—*T. E. Newland.*

3885. Jex, Frank B., & Merrill, Reed M. (U. Utah) *A study in persistence: Withdrawal and graduation rates at the University of Utah.* *Personnel Guid. J.*, 1962, 40(9), 762-768.—Since World War II, one pattern of higher education has shown a shift from "dropout" to "interruption" of academic goals. By extrapolation in a longitudinal study, 60% of classes in the near future are expected to achieve graduation from the university. The findings have implications for programs of student personnel, evening programs, student attitudinal changes towards their studies, and the pattern of business support of education as a part of career development.—*S. Kavruck.*

3886. McDonnell, M. W. (Camrose, Canada) *The prediction of academic achievement of superior grade three pupils.* *Alberta J. educ. Res.*, 1962, 8(2), 111-118.—A sample of 178 pupils (from a Grade 3 population of 3700 with an IQ of 120 or more on the CTMM) were given 3 intelligence tests (Detroit 1st grade, CTMM—Short Form, and Raven's Progressive Matrices) and the Primary Battery of the California Achievement tests. Except for the Detroit, all tests were given about the same time in Grade 3, thus yielding mostly data on concurrent validity. The Detroit and the Matrices were the best predictors and had the only significant intercorrelation among intelligence tests. The Progressive Matrices predicted achievement (even language) better than the CTMM.—*G. M. Della-Piana.*

3887. Rosenberg, Leon A., McHenry, Thomas B., & Rosenberg, Anna Maria. (Medical Field Service School, Fort Sam Houston) *Sociometric ratings as predictors of academic performance.* *J. appl. Psychol.*, 1962, 46(4), 265-268.—An experiment to determine the degree of accuracy with which sociometric ratings can be used to predict academic performance. A 14-item sociometric questionnaire was administered to 86 students before any academic grades were available. 2 rating measures, one emphasizing future job performance and the other dealing with personal adjustment, were found to be significantly related to academic performance ($r = .40$, $p < .01$; $r = .35$, $p < .01$). The relationship, however, appeared to be restricted to the upper range of academic performance; the measures being unable to predict failing or below average performance.—*Journal abstract.*

3888. Spielberger, Charles D. (Duke U.) *The effects of manifest anxiety on the academic achievement of college students.* *Ment. Hyg., N. Y.*, 1962, 46(3), 420-426.—Students of low intellectual ability (as measured by the ACE) earned poor grades in college irrespective of their Taylor Manifest Anxiety score, while anxious students in the middle range of ability obtained lower grades and a higher percentage of academic failures than non-anxious students of comparable ability. For the very superior students (with ACE scores over 150), however, anxiety appeared to facilitate academic performance.—*M. H. Lewin.*

EDUCATIONAL PERSONNEL

3889. Hargiss, Genevieve. (U. Kansas) *The acquisition of sight singing ability in piano classes for students preparing to be elementary teachers.* *J. Res. music Educ.*, 1962, 10, 69-75.—32 college students in a music methods course were taught

"music fundamentals, playing the piano by note, playing by ear, and the improvising of simple chorded accompaniments for children's songs and rhythmic activities." With control Ss, "singing was not particularly emphasized," but with 32 experimental Ss "the students sang everything they played." Both groups made significant gains in recognition of notation, musicality, and piano performance, but the experimental Ss made significantly better posttest scores in sight singing.—D. S. Higbee.

3890. List, Davida Norma. (New York U.) The attitudes of women school teachers and parents toward the teacher role. *Dissert. Abstr.*, 1962, 22(12), 4427.—Abstract.

3891. Perron, Roger. La perception de l'élève par le maître: Réflexions et suggestions à propos d'un questionnaire. [The teacher's perception of the student: Thoughts and suggestions with respect to a questionnaire.] *Psychol. Franc.*, 1962, 7(1), 26-41.—Based on a 10-item questionnaire study involving 20 teachers and 293 children, it is suggested that some of the more important problems to consider include the way in which the teacher perceives the student, the profile of the average student as perceived by the average teacher, the good student contrasted with the poor student, and the sex of the student compared with the sex of the teacher.—C. J. Adkins.

INDUSTRIAL & MILITARY PSYCHOLOGY

3892. International Ergonomics Association. Proceedings of First International Congress on Ergonomics. *Ergonomics*, 1961, 5(1), 1-328.—51 papers are presented in 4 general sections on: (a) speed of work and its relation to physiological stress and systems of payment, including reports on fatigue, effects of temperature and other environmental conditions, and "cost price of food calories; (b) adjustment of work and environment for older people; (c) evaluation of work and working environment in ergonomic terms, including such matters as job analysis, manpower management, computer design, and office work; and (d) a miscellaneous group of papers dealing with such topics as effects of vibration, walking on different surfaces, earnings in various age classes, target tracking, and social factors.—B. T. Jensen.

VOCATIONAL GUIDANCE & APTITUDES

3893. Arnold, Wilhelm. (U. Würzburg, Germany) Begabungswandel und Erziehungsfragen. [Aptitude change and educational problems.] Munich, Germany: Juventa, 1960. 152 p.—With the aim of developing statistically adequate norms and obtaining additional data on the structure of tests used by the psychology section of the Vocational Counseling Service of the German Federal Employment Service, empirical studies were initiated with a stratified sample of 5108 boys and girls 14-15 years old. The monograph describes the sample, tests used, and factors derived. Findings are discussed in terms of sex differences, rural-urban dimensions, and other socioeconomic variables; personality development; and educational implications relative to aptitude and achievement.—H. P. David.

3894. Brown, Fred G. (U. Missouri) A note on expectancy ratios, base rates, and the SVIB.

J. counsel. Psychol., 1961, 8(4), 368-369.—The relation of the base rate problem to making predictions from Strong's follow-up study.—E. R. Oetting.

3895. David, C. (U. Portland) Interpersonal measurement of two occupational interest groups. *J. proj. Tech.*, 1962, 26(3), 276-282.—The hypothesis that different occupational groups will cluster at behavioral levels which may differentiate them is substantiated in part. Different source data revealed variability among group members despite common occupational interests.—A. Greenwald.

3896. Gonyea, George G. (U. Texas) Dimensions of job perceptions. *J. counsel. Psychol.*, 1961, 8(4), 305-312.—Male college freshmen evaluate the similarity of 30 selected occupational titles. 12 oblique factors and 5 2nd order factors do not resemble the conventional interest groupings.—E. R. Oetting.

3897. Miller, K. M. Une méthode stéréotype de classement pour l'évaluation des intérêts professionnels. [A stereotype method of classifying vocational interests.] *Travail hum.*, 1962, 25(1-2), 151-158.—The Rothwell-Miller Interest Blank, developed in Australia, provides a means of assessing vocational interests by ranking job titles. These are representative of 12 occupational stereotype categories. The test may be used in group, as well as individual fashion, and it is used primarily as a basis for the guidance interview. Scores are converted into percentiles, thereby permitting use for guidance or placement. Reliability and validity appear to be promising.—R. W. Husband.

3898. Stephenson, Richard R. (U. Iowa) A new pattern analysis technique for the SVIB. *J. counsel. Psychol.*, 1961, 8(4), 355-362.—Difficulties in replication of studies using Darley and Hagenah's technique are discussed and a simple technique for objective pattern classification is presented.—E. R. Oetting.

3899. Stephenson, Richard R. (U. Iowa) Faking "chance" on the SVIB. *J. appl. Psychol.*, 1962, 46(4), 252-256.—Are scores that fall within the so-called "chance" areas of certain occupational scales of the Strong Vocational Interest Blank for Men (SVIB) "easily obtainable by chance"? To answer this question, Ss were selected whose scores, under standard testing conditions, were either higher than chance, lower than chance, or in the chance area itself. These Ss were then instructed to "fake" directionally (in the direction of the chance area) and to "fake chance." The results indicated that Ss who can fake directionally cannot fake chance, even when the chance range is in the same direction as the one they have faked. It was concluded that rather than ignore scores within the chance area, it may be better to ignore the chance areas themselves.—*Journal abstract.*

3900. Strong, Edward K. (Stanford U.) Good and poor interest items. *J. appl. Psychol.*, 1962, 46(4), 269-275.—Interest items may be evaluated in terms of unfamiliarity, ambiguity, differentiation between men-in-general and criterion group, number of scales on which the items are weighted, reliability, and extent to which they contribute to total score. These characteristics are utilized in the elimination of inferior items and addition of new items in revising the Vocational Interest Blank for Men. Like, indifference, dislike (L-I-D) items are contrasted with

preference between items in Parts VI and VII and ratings of present abilities in Part VIII. In general, good items are located midway between the interests of criterion groups and are liked distinctly more than the average by some criterion groups and distinctly less by other criterion groups.—*Journal abstract.*

3901. Stroup, Herbert. (Brooklyn Coll.) **Kafka as a vocational counselor.** *J. counsel. Psychol.*, 1961, 8(4), 291-295.—Kafka's mystical view of the role of accidental incidents in vocational development.—*E. R. Oetting.*

3902. Wax, J. (VA Hosp., Palo Alto, Calif.) **Teaching supervisors the techniques of counseling employees.** *Ment. Hosp.*, 1962, 13(4), 214-215.—15 principles such as "Take it seriously," "Be prepared," etc. are listed as content of a 6 hour course; "... instructors are social workers who draw heavily on social work knowledge and skill."—*L. Gurel.*

OCCUPATIONAL & CAREER INFORMATION

3903. Mare, G. D., & Sargeant, R. (Medical Research Council) **Two methods of studying changes in absence with age.** *Occup. Psychol.*, 1961, 35(4), 245-252.—Personnel records were analyzed cross-sectionally and longitudinally for absence history of 300 men over the last decade. The objective was to check the assumption of the cross-sectional method that age differences contribute to the absenteeism. An aging effect was found for certified sickness. High absence frequency, however, was not age-related.—*M. York.*

3904. Singer, Dorothy Milgram. (Boston U.) **A study of lump sum settlements and rehabilitation under the Massachusetts Workmen's Compensation Act.** *Dissert. Abstr.*, 1961, 22(4), 1286.—*Abstract.*

3905. Wolfe, H. E. (Longview State Hosp., O.) **The attitude of small industrial employers toward hiring of former state mental hospital patients.** *J. clin. Psychol.*, 1961, 17(1), 90-92.—In this follow-up study of an earlier paper by Bieliauskas and Wolfe (see 36: 21R56B), the employers of 934 manufacturing firms employing 1-99 persons were interviewed concerning their attitudes towards the hiring of former state mental hospital patients. The results suggested significantly favorable attitudes on the part of employers.—*V. J. Bieliauskas.*

SELECTION, PLACEMENT, APPRAISAL

3906. Bass, B. M. (U. California) **Further evidence on the dynamic character of criteria.** *Personnel Psychol.*, 1962, 15(2), 93-97.—Performance criteria were collected semi-annually over 48 months for 99 salesmen of a national food distributor. Alternate forms of a performance check list provided the criterion ratings. Predictors included a test of intelligence, Bruce's Sales Knowledge Test, and 3 peer ratings yielding measures of popularity, esteem, and ability. Initial validities decline considerably over 4 years when based on similar criteria of performance on the same workers. The decrease in agreement between any 2 merit ratings over time follows a simple negative monotonic function. The ultimate invalidation of the sociometric and test estimates of abilities suggests that sales performance is less contingent on ability than on esteem and popularity.—*A. S. Thompson.*

3907. Campbell, J. T. (Western Reserve U.) **Assessments of higher-level personnel: I. Background and scope of the research.** *Personnel Psychol.*, 1962, 15(2), 57-62.—This introduction to a series of 7 articles on assessment procedures used with high-level industrial personnel describes the methods and instruments of appraisal and the criterion data obtained.—*A. S. Thompson.*

3908. Campbell, J. T., Otis, J. L., Liske, R. E., & Prien, E. P. (Western Reserve U.) **Assessments of higher-level personnel: II. Validity of the over-all assessment process.** *Personnel Psychol.*, 1962, 15(2), 63-74.—Using sales and nonsales groups, the validity of predictions made by the psychologist who prepared the final assessment report was studied. The results indicated that (a) psychologists are able to make predictions of successful and unsuccessful job performance using a combination of interview information, objective tests, and clinical reports of projective test data; (b) actuarial prediction from specific test scores were not effective in the situation studied; (c) industrial supervisors were more lenient than psychologists in their assessment of individuals; and (d) prediction of a criterion rating worded in action terms was more effective than one worded in behavioral terms.—*A. S. Thompson.*

3909. Greer, George D., Jr., Smith, Wayne D., & Hatfield, Jimmy L. **Improving flight proficiency evaluation in Army helicopter pilot training.** *HumRRO tech. Rep.*, 1962, No. 77. ix, 56 p.—Studies stressed the unsatisfactory relationship between traditional, unstandardized flight training evaluation and training grades. Content analysis of the training program led to Intermediate and Advanced Pilot Performance Description Records, based on standard rides. The method is recommended because of higher reliability and as a means of diagnosing students' specific deficiencies.—*R. Tyson.*

3910. Hughes, J. L., & Dodd, W. E. (IBM Corp.) **Validity versus stereotype: Predicting sales performance by ipsative scoring of a personality test.** *Personnel Psychol.*, 1961, 14(2), 343-355.—The validity of the usual normative scoring method for the Gordon Personal Profile (GPP) was compared to the validity of an ipsative scoring method devised for this test. The criteria used were different aspects of sales performance over a 3-year period for a sample of 130 data processing machine salesmen. One of the ipsative traits, Sociability, correlated negatively (-0.34) with a continuous sales production criterion ($n=90$) and showed a significant difference in proportions between a top producing and promoted group ($n=44$) and a low producing and separated group ($n=42$). The normative GPP scores were not related to the criteria.—*A. S. Thompson.*

3911. Judy, C. J. (Lackland AFB) **A validation of qualification requirements for work in a USAF specialty.** *Occup. Psychol.*, 1961, 35(1-2), 71-75.—The utility of 31 predictors, pitted against a 230-item proficiency test, was assessed with respect to 415 B-52 mechanics. An iterative technique for multiple correlation indicated that 1 of 3 groups of variables added to the composite prediction. This group was Mechanical Aptitude Index, equipment maintenance training, and AF maintenance experience.—*M. York.*

3912. Kennedy, Robert S., & Graybiel, Ashton. **The validity of tests of canal sickness in predicting**

susceptibility to airsickness and seasickness. *USN Sch. Aviat. Med. NASA jt. res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 71; NASA Order No. R-47. ii, 8 p.—21 Ss were exposed to a laboratory method for producing motion sickness (canal sickness) aboard the Slow Rotation Room. In an effort to determine the predictive ability of this method, the Ss were also subjected to acrobatics in an aircraft and to heavy or moderately calm sea states. In addition nystagmic response to caloric stimulation was observed. It was found that a positive relationship existed between performance on the Slow Rotation Room, caloric irrigation, and airsickness. This relationship also existed during heavy seas and to a lesser extent on moderate seas. In general, it may be concluded that individual performance on the standard procedure used to produce canal sickness aboard the Slow Rotation Room is predictive of susceptibility to air and seasickness.—*USN SAM & NASA*.

3913. Morrison, Robert F., Owens, William A., Glennon, J. R., & Albright, Lewis E. (Purdue U.) Factored life history antecedents of industrial research performance. *J. appl. Psychol.*, 1962, 46 (4), 281-284.—The purpose of this study was to better comprehend underlying, discriminating personal characteristics represented in a population of 418 petroleum research scientists. 5 factors were extracted from a matrix of 75 discriminating life history items and 3 criteria of research performance. The factors were tentatively identified as Favorable Self-Perception, Inquisitive, Professional Orientation, Utilitarian Drive, Tolerance for Ambiguity, and General Adjustment. Profiles of the 3 criterion groups across the 5 factors revealed great similarity between the profiles based on ratings, but substantial differences between these and the patent disclosures profile. The observed differences were interpreted in terms of their implications for distinctive personnel policies.—*Journal abstract*.

3914. Paquin, J. A. Staff appraisal: A case study. *Personnel Pract. Bull.*, 1962, 18(2), 33-42.—This is a description without evaluation of a staff appraisal system in a factory employing 1050 people. "... field reviews and self-appraisals, combined with counselling, seem to have proved highly successful." 5 appendices present forms and directions.—*J. L. Walker*.

3915. Phelan, J. G. (Los Angeles State Coll.) Projective techniques in the selection of management personnel. *J. proj. Tech.*, 1962, 26(1), 102-104.—Combined Rorschach and TAT data proved to be the best predictor of promotion to administrative positions and were reported as the tests of preference by evaluating psychologists.—*A. F. Greenwald*.

3916. Philips, M. H. Merit rating for skilled and semi-skilled workers. *Personnel Mgmt.*, 1962, 44(Whole No. 360), 120-128.—The system is based upon ratings for craftsmanship, output, and experience. Discussed are its rationale, method of introduction, and method of operation. Sample rating sheets are appended.—*A. R. Howard*.

3917. Plag, J. A. (USN Medical Neuropsychiatric Research Unit, San Diego, Calif.) Some considerations of the value of the psychiatric screening interview. *J. clin. Psychol.*, 1961, 17(1), 3-8.—A report by some investigators published earlier indi-

cated that the psychiatric interview was a valid technique for military selection. This study attempted to compare the predicted validity of the clinical examination and the "actuarial techniques." 1813 recruits reporting aboard the station were interviewed and also examined with a formal psychological test. The predictions made by the interviewer, and by the psychologist administering the tests, were filed separately for later evaluation. 67 or 3.7% of the recruits received for training during this period were discharged from service as psychiatrically unsuitable. The statistical evaluation of both the clinical and the testing technique did not show significant differences between the 2 screening methods. A suggestion was made that perhaps both techniques should be used in order to improve the predictions concerning the adjustment of Navy personnel.—*V. J. Bieliasukas*.

3918. Roche, William James, Jr. (Southern Illinois U.) The Cronbach and Gleser utility function in fixed-treatment employee selection. *Dissert. Abstr.*, 1962, 22(12), 4413.—*Abstract*.

3919. Uhrbrock, R. S. (Ohio U.) 2000 Scaled items. *Personnel Psychol.*, 1961, 14(2), 375-420.—A set of 2000 single sentence statements of the type used in the preparation of employee rating scales was prepared and randomly sorted into 10 piles of 200 cards each. Volunteer male judges (N=160) then sorted cards in the standard manner into 11 piles in respect to "favorable-unfavorable" estimates. Each of the 10 sets of cards was sorted by 16 different judges; each judge sorted 200 cards. Items, mean scale values, and standard deviations are reported.—*A. S. Thompson*.

TRAINING

3920. Erdbrink, Wayne L. Relation of small visual acuity defects to the ability to learn in flight training and perform in operational flying. *USN Sch. Aviat. Med. res. Rep.*, 1961, Proj. MR005.13-3001, Subtask 3, Rep. No. 1. 12 p.—The present study was instituted in 1953 in order to evaluate the relationship of small visual acuity errors and the ability to complete flight training and to perform in operational flying. Since 1953, 124 individuals have been placed in the study. Excluding the 19 individuals placed in the study in 1961, the total studied through 1960 would be 105. In these 8 years, 66 of the individuals have been designated as naval aviators, 44 of whom are actively flying today, 40 in Service Group 1. Of the 44 actively flying aviators, only 20 had a progression of their myopia by a mean spherical equivalent of -0.37 diopter. These aviators were designated only because of the existence of this study.—*USN SAM*.

3921. Goldstein, Donald A., & Newton, John M. (Electric Boat Division, General Dynamics Corp.) Transfer of training as a function of task difficulty in a complex control situation. *J. exp. Psychol.*, 1962, 63(4), 370-375.—"Four groups of 20 Ss were trained on a complex tracking task differing in the degree of control lag. Following training, 5 Ss from within each group were transferred to the other systems, with one subgroup transferred to the same system. It was found that, on the basis of mean time on target scores per five-trial block, the more difficult tasks were those with the longer control lags. It was also found that training on the most difficult task, the system with the longest control lag, pro-

duced generally better transfer effects than did training on any other system.—J. Arbit.

3922. Gruenfeld, L. W. (Wabash Coll.) **Selection of executives for a training program.** *Personnel Psychol.*, 1961, 14(2), 421-431.—Based on a study of 51 executives attending a summer program, the aptitudes required for success in a liberal arts program for executives were found to be primarily of an intellectual nature; word meaning, reading, and mathematical ability made up the content of those predictors which correlated significantly with faculty criterion ratings. In contrast, personality factors failed to discriminate between those individuals who were rated successful and "others." The Adaptability Test, a 15-minute intelligence test consisting of vocabulary and mathematical reasoning items, was recommended.—A. S. Thompson.

3923. Kahneman, D., & Ghiselli, E. E. (Hebrew U., Jerusalem) **Validity and nonlinear heteroscedastic models.** *Personnel Psychol.*, 1962, 15(2), 1-11.—Use of the Pearsonian coefficient in validation studies implies that linear homoscedastic relationships hold between test scores and criteria, that the accuracy of prediction of criteria from test scores is the same throughout the entire range of scores, and that both success and failure on a job are the result of the same factors. Examination of the relationships between test scores and criteria for 3 groups—executives, office workers, and autobus repairmen—indicated that descriptions of the predictive power of the tests and of the traits important in job success and failure as given by the Pearsonian validity coefficient were not as meaningful and useful as when using theta. Success and failure are often due to different trait patterns.—A. S. Thompson.

3924. Matyukhina, M. V., Patrina, K. T., & Shneider, D. M. (Volograd, USSR) **Nekotorýe puti vospitaniya tekhnicheskogo myshleniya u uchashchikhsya starshikh klassov.** [Some ways of training technical thinking in pupils of senior classes.] *Vop. Psikh.*, 1962, No. 1, 11-18.—Independent technical thinking appears to be lacking in pupils of several schools given physics problems to solve. Analysis of this deficiency, observations, and trial classes suggest that pupils should observe the technical principles involved in a process in a simple model, then in a working model, and after that on the actual job. Assignments should be made to the pupil for independent work which arouse his interest, involve him in practical activity, require him to read technical journals, etc.—H. Pick.

3925. Poland, Harold Vincent. (Fordham U.) **The relationship between self concept and supervisory and peer ratings of success in nurses' training.** *Dissert. Abstr.*, 1961, 22(4), 1260.—Abstract.

TASK & WORK ANALYSIS

3926. Chambers, E. G. **Industrial fatigue.** *Occup. Psychol.*, 1961, 35(1-2), 44-57.—A summary is provided of (hard-to-get) reports by the Industrial Fatigue (later Health) Research Board between 1919 and 1938. It serves as a good historical treatise on the subject. (88 ref.)—M. York.

3927. Evans, Wayne O. (USA Medical Research Lab., Ft. Knox, Ky.) **The effect of treadmill grade on performance decrement using a titration schedule.** *USA Med. Res. Lab. Rep.*, 1962, No. 535. ii,

10 p.—This investigation is a methodological study of the effect of an independent variable of work with prima facie validity on the performance decrement of Ss walking at a submaximal rate on a treadmill, the velocity of which is controlled by the S on a titration schedule. Indices of performance were derived from a best estimate of linear fit for the data. The slope constant, the ordinal intercept, the total walking time, and the "tracking behavior" were considered for correlation, individual variance, and variation with changes in the grade of the treadmill. Changes in the grade of the treadmill were shown to produce the expected changes in intercept and total walking time.—USA MRL.

3928. Logan, G. A., & Lockhart, Aileene. (U. Southern California) **Modified quadrant assembly for measuring isometric knee extensor strength at selected angles.** *Percept. mot. Skills*, 1962, 14(1), 35-37.—A description is presented of a Modified Quadrant Assembly, a device for the measurement of knee extensor strength at varying angles in the range of motion. The instrument, modified from a similar device reported by Brewerton of England, is described and illustrated. Instructions for its construction, suggestions for its use, and a discussion of anthropometric considerations are included.—W. H. Guertin.

3929. Zavalishima, D. N., & Pushkin, V. N. (Moscow, USSR) **Nekotorýe voprosy operativnogo planirovaniya v trude dezhurnogo po stantsii.** [Some problems of operations planning in the work of the railway station duty officer.] *Vop. Psikh.*, 1962, No. 1, 3-10.—Observations were made of the decision making involved in routing traffic through and around railroad stations. These suggested that the decision making involved the use of logical operations of conjunction, disjunction, and implication. Some duty officers seemed to depend only on the conjunctive operations, while others utilized all 3 logical operations in their planning and execution. The failure of more officers to use the latter approach is attributed to the type of training given them. It is suggested that more emphasis be placed on the operations of thinking and less on the technical details of the job.—H. Pick.

WORK ENVIRONMENT & PERFORMANCE

3930. Bartlett, Roscoe G., Jr. (USN School Aviation Medicine, Pensacola, Fla.) **A closed circuit, compressed oxygen source rebreather system for aircraft, featuring automatic economic nitrogen elimination.** *USN Sch. Aviat. Med. res. Rep.*, 1961, Proj. MR005.13-3100, Subtask 8, Rep. No. 9. ii, 9 p.—A rebreather oxygen system for aircraft has been developed which utilizes a new economic nitrogen elimination technique. The entire device can be seat mounted and will weigh less than 30 lb. with sufficient oxygen storage and CO₂ absorber for a 10-hour flight.—USN SAM.

3931. Bartlett, Roscoe G., Jr., & Hertz, Rita A. **Automatic economic nitrogen elimination in oxygen rebreathing systems.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-3100, Subtask 8, Rep. No. 10. 5 p.—Economic, automatic nitrogen elimination from the body is a necessary adjunct to an acceptable oxygen rebreather system. A new approach to nitrogen elimination has been developed. Economic, periodic nitrogen purging is accomplished

with normal breathing and without any manual manipulation or attention by the aviator during the elimination schedule. The purging schedule makes possible the design of a completely automatic self-purging oxygen rebreathing system.—*USN SAM*.

3932. Clarke, Ernest R., & Jones, Clarke E. (Quartermaster Research & Engineering Command, Natick, Mass.) **Manual performance during cold exposure as a function of practice level and the thermal conditions of training.** *J. appl. Psychol.*, 1962, 46(4), 276-280.—3 groups of 10 Ss each were given varied thermal experience (warm or cold hands) during 3 weeks of training on a standard manual task. The results were as follows: (a) 1 day of cold-hand training significantly reduces the size of a manual decrement usually associated with cold exposure, but continued cold experience did not; (b) skill level on the task per se did not interact with the cold induced performance decrements; and (c) the thermal conditions associated with performance on the task appeared to become part of the stimulus complex eliciting correct manual responses when these thermal conditions were maintained for a large number of trials, i.e., the Ss learned, not merely to perform on the task, but to perform with warm, or cold, hands specifically.—*Journal abstract*.

3933. Guedry, F. E., Graybiel, A., & Collins, W. E. (USN School Aviation Medicine, Pensacola, Fla.) **Reduction of nystagmus and disorientation in human subjects.** *USN Sch. Aviat. Med. NASA Jt. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 69; NASA Order No. R-47. ii, 7 p.—Nystagmus, disorientation, and nausea were reduced in Ss living and moving about for several days in a slowly rotating room. The reduced nystagmus was not reinstated by assigning "arousal-tasks" which are ordinarily effective in this respect. After rotation was stopped residual effects were noted for several hours. These included compensatory nystagmus, compensatory illusory reactions, and some motion sickness. Other Ss were exposed to similar circumstances for shorter periods wherein only restricted head movements in a particular plane were permitted. Nystagmus, illusory phenomena, and nausea were reduced by this procedure. However, the habituation did not transfer to forms of vestibular stimulation including head movements in an "unpracticed quadrant" which produce reactions similar in direction and plane to those repeatedly experienced during the habituation period. Residual effects from this shorter more restricted exposure were slight.—*USN SAM & NASA*.

3934. Kopra, Lennart L., & Strickland, Lee E. **Noise exposure of B-52 and KC-135 aircraft maintenance personnel.** *USAF SAM Rep.*, 1961, No. 61-117. 17 p.—The authors, for a period of 5 working days, followed each of 16 men as they did their jobs. Ss included 4 test-cell crew members, 4 engine-conditioning mechanics, 4 B-52 bomber ground-crew members, and 4 KC-135 tanker ground-crew members. Measurements were made of the duration of time during which each S was exposed to sound levels ranging from 90-140+ db. on each of 4 working days, and an analysis was made of the noise characteristics of turbojet engines and ground-power equipment to which each S was exposed. The authors conclude that Ss are not exposed to potentially damaging sound levels long enough to experience

irreversible hearing loss provided that available ear protection devices are worn consistently by these men.—*M. C. Payne, Jr.*

3935. Snyder, F. W. (Boeing Co., Wichita, Kan.) **Preliminary report of a research program on the effects of low-frequency vibration on human performance.** *Percept. mot. Skills*, 1962, 14(1), 62.—A description is given of the 30-month program of laboratory research to evaluate the effects of low frequency, high amplitude sinusoidal vibration on perceptual and motor task performance. Apparatus, environmental controls, and tasks are described briefly, as are the goals of the research.—*W. H. Guertin*.

3936. Starke, R. D., & Bartlett, R. G., Jr. **Oxygen consumption in normal subjects performing the modified Harvard Step Test.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-7004, Subtask 5, Rep. No. 14. 7 p.—By use of a recently described new, simple technique, accurate measurements of oxygen consumption during 7 graded stress loads on the Harvard Step Test are presented. Comparisons to the conventional Master's test for coronary reserve are presented.—*USN SAM*.

3937. Tadin, I. (Željezara, Sisak) **Analiza distribucije tjednih odmora u sklopu opće problematike apsentizma.** [Analysis of the distribution of weekly rest.] *Arh. Hig. rada*, 1960, 11, 9-25.—In a big metal factory it was found that the weekly rests were not given periodically, and that the distribution of periodicity was rather large. The average weekly rest took place every 9.02 days. This distribution of rests increased the number of accidents and was likely to lower the quality of production, and produce financial losses. Some measures are recommended for improving the existing state.—*B. Petz*.

3938. Tarriere, C., & Wisner, A. **Effets des bruits significatifs et non significatifs au cours d'une épreuve de vigilance.** [Effects of significant and nonsignificant noises during a test of vigilance.] *Travail hum.*, 1962, 25(1-2), 1-28.—4 different noise environments were supplied during a monotonous and long-continued (90 min.) test of visual detection: silence (35 db.), car noise, speech, and music program, all at 90 db. In silence, the loss of attention, evidenced by omissions, occurred as early as the 2nd half hour. Motor noise caused loss as late as the 3rd half hour. Classical music showed the same trends as silence. Listening to stories produced varying results, with no consistent trends. There were wide individual differences, but each S remained consistent within himself upon further testing.—*R. W. Husband*.

MOTIVATION, ATTITUDES, TRAITS

3939. Aldis, Owen. (Harvard U.) **Of pigeons and men.** *Harv. bus. Rev.*, 1961, 39(4), 59-63.—Businessmen may not realize to what extent conventional wage and salary systems rely on negative reinforcement. Methods which rely more on immediacy of reward, piece-rate pay, and greater randomization may lead both to higher productivity and increased job satisfaction.—*C. F. X. Youngberg*.

3940. Cohen, A. M., & Meredith, W. R. (Case Inst.) **Management and employee needs.** *Advanc. Mgmt.-Off.-Exec.*, 1962, 1(8), 28-32.—Management should recognize the hierarchy of needs, and their cyclical nature. Once this cycle is recognized a pro-

gram of short-term and continuous expenditure of benefits can be established without prematurely depleting resources. Timing is of major importance.—*E. Q. Miller.*

3941. **Gotterer, M. H.** (U. California, Berkeley) **Union reactions to unilateral changes in work measurement procedures.** *Personnel Psychol.*, 1961, 14(2), 433-450.—This study, based on case studies of 13 companies, examines labor-management struggle brought on by management efforts to unilaterally introduce a system of synthetic times. Interviews were held with factory managers, foremen, engineers, and union officers of companies varying in size from 50 to 60,000 employees. The union's resistance to synthetic times can be divided into 3 stages: (a) wait and see; (b) attempt to maintain traditional bargaining privileges; (c) attack company's right, under existing contract, to use system. The experiences indicate that the unilateral introduction of a new procedure for directly, or indirectly, determining production standards or piece work rates will not prove satisfactory.—*A. S. Thompson.*

3942. **Handyside, J. D.** (Standard Tel. & Cables, Ltd.) **Satisfactions and aspirations.** *Occup. Psychol.*, 1961, 35(4), 213-244.—A progress report on questionnaire-technique experimentation by the National Institute of Industrial Psychology. Empirical data on the nonresponse problem and comparison of interview and questionnaire answers are discussed along with the derived factors underlying job satisfaction and aspiration. Appendixed scale items and factor analytic procedures.—*M. York.*

3943. **Jardillier, P.** **Étude de 14 facteurs influant sur l'absentéisme industriel.** [Study of 14 factors affecting industrial absenteeism.] *Travail hum.*, 1962, 25(1-2), 107-116.—Absenteeism was studied for 878 men and 306 women in a factory described as being far from any large city. Work was partly repetitive, partly skilled, and partly done by unit production. Illness and accident absences were not considered; this study was directed primarily toward personal reasons. Men averaged 21 days, women 35 a year. The 4 most common causes were age, work done outside, distance from home, and with married women total family income.—*R. W. Husband.*

3944. **Johnson, LeRoy.** (U. Wisconsin) **The relationship of work experience to orientation toward retirement.** *Dissert. Abstr.*, 1961, 22(6), 2090.—*Abstract.*

3945. **Nederlands Instituut voor Praeventieve Geneeskunde.** **The absenteeism problem.** *Mens Onderneming*, 1962, 16(5), 265-347.—A study of the reasons and practical solutions of this problem has led to the growing opinion that "illness" and absenteeism are not identical and are being influenced by social and psychological factors. It should not be fought by incidental measures but by creating a sound personnel management; the 5-day week had a favorable effect on the duration of absence. Sociologists should not study the problem as an independent phenomenon but in relation to other possible forms of withdrawal from work. Individual authors are W. Ekker, J. de Groot, G. J. Fortuin, and H. Philipsen. (English summaries)—*J. A. Lucker.*

3946. **Petz, B., & Vidaček, S.** (Inst. za Medicinska Istraživanja, Zagreb) **Analiza izostanaka s posla u jednom zagrebačkom poduzeću.** [Analysis of ab-

senteeism in a Zagreb factory.] *Arh. Hig. rada*, 1960, 11, 289-297.—The analysis of absences in a Zagreb factory has shown that: (a) the average number of days lost by women is considerably higher than by men; (b) with older workers the average number of both absences and days lost is lower than with younger workers; and (c) with respect to as regards family responsibility, the highest average number of absences was observed in single men, and women with children.—*B. Petz.*

3947. **Salkind, Isadore.** (May T. Morrison Cent. Rehabilitation, San Francisco, Calif.) **Changing employers attitudes toward the psychologically handicapped.** *J. Rehabil.*, 1962, 28(3), 26.—The use of a staff of trained public relations specialists well oriented in the field of vocational rehabilitation as the basis for a frontal attack on major employers throughout the country as the means of altering unfavorable attitudes to employment of the emotionally disturbed, the mentally retarded, and the ex-mental hospital patient.—*M. A. Seidenfeld.*

3948. **Sinha, Durganand, & Sarma, Keshab C.** (Allahabad U.) **Union attitude and job satisfaction in Indian workers.** *J. appl. Psychol.*, 1962, 46(4), 247-251.—Relationship between attitude towards union and job satisfaction was studied on a sample of 100 workers in a light engineering factory in India by use of specially constructed interview schedules. There was a significant negative association between the 2 measures ($r = -.47$). Of the personal factors—age, marital status, and length of union membership—were significantly related to job satisfaction ($p < .01$). None of these were, however, found to influence union attitude significantly.—*Journal abstract.*

3949. **Super, Donald E.** (Columbia U.) **The structure of work values in relation to status, achievement, interests, and adjustment.** *J. appl. Psychol.*, 1962, 46(4), 231-239.—The Work Values Inventory (WVI), a 210-item, paired-comparison instrument designed to measure 15 different work values, was administered together with a number of measures of intelligence, interest, adjustment, and achievement to 9th grade boys of the Career Pattern Study ($N = 88$). The results show no tendency for so-called intrinsic values to be associated, nor for extrinsic values to be more intercorrelated than are values of different types. A centroid factor analysis of the 40×40 matrix yielded 10 factors, of which 7 were clearly identifiable. 4 were clearly value factors, 2 could be classified as either values or interests, 3 were personality and adjustment factors, and 1 was an achievement factor. The WVI seemed particularly useful in its measurement of 4 value factors not revealed by interest or adjustment measures.—*Journal abstract.*

MANAGEMENT & ORGANIZATION

3950. **Andrews, Kenneth R.** (Harvard Business School) **Reaction to university development programs.** *Harv. Bus. Rev.*, 1961, 39(3), 116-134.—Using both the questionnaire and interview responses of many of the participants, campus programs for practicing executives can be said to be successful.—*C. F. X. Youngberg.*

3951. **Benge, Eugene J.** (Haverford, Pa.) **An alternative to compulsory arbitration.** *Advanc. Mgmt. Off. Exec.*, 1962, 1(8), 14-15.—The alterna-

tive to compulsory arbitration is a national fair wage plan based on job evaluation whereby each job would receive a fair basic wage relative to all other jobs in the United States.—*E. Q. Miller.*

3952. Donovan, Thomas R. (U. Detroit) Socio-economic and educational factors influencing the achievement level of individuals in large-scale organizations. *Sociol. soc. Res.*, 46(4), 416-425.—Executives and lower managers in 4 large multi-plant corporations were studied. For these groups, the differences in their socioeconomic and educational backgrounds are described. Related findings in the literature are examined with reference to career patterns and theories of career causation. The results showed substantial differences in the backgrounds of the 2 groups studied.—*Journal abstract.*

3953. Fleishman, E. A., & Harris, E. F. (Yale U.) Patterns of leadership behavior related to employee grievances and turnover. *Personnel Psychol.*, 1962, 15(2), 43-56.—This study focused on 2 leadership patterns, Consideration and Structure, and on 2 questions: (a) the form of the relationship between leader behavior and indices of group behavior, and (b) the interaction effects of different combinations of Consideration and Structure. Relationships between foreman behavior and 2 indices of group behavior, labor grievances, and employee turnover, were investigated. In general, low Consideration and high Structure go with high grievances and turnover but there are critical levels beyond which increased Consideration or decreased Structure have no further effect. The relationship is curvilinear and hyperbolic. The thresholds differ for grievances and turnover.—*A. S. Thompson.*

3954. Goode, Cecil E. (McLean, Va.) Leadership: On course or aground? *Advanc. Mgmt.-Off. Exec.*, 1962, 1(8), 7-9.—Leadership training has limited success. The main thing the organization can do is not in the area of education and training at all. The principle actions the management can take are: do a good job of selecting prospects for development, provide an encouraging and facilitating climate, recognize achievement and personal efforts to improve.—*E. Q. Miller.*

3955. Indik, B. P., Georgopoulos, B. S., & Seashore, S. E. (U. Michigan) Superior-subordinate relationships and performance. *Personnel Psychol.*, 1961, 14(2), 357-374.—This study is concerned with the proposition, and 4 hypotheses derived from it, that the nature of superior-subordinate relationships in an organization, as perceived or evaluated by subordinates, effects the job performance of subordinates, whether the latter are considered as a group or as individuals. The results of this study of 975 non-supervisory employees in a nation-wide transportation company suggest that a high level of performance tends to be positively associated with openness of communication, satisfaction with supervisor's supportive behavior, mutual understanding, and local influence and autonomy on work-related matters. Issues of research strategy and analysis are discussed.—*A. S. Thompson.*

3956. Kornhauser, A. (Wayne State U.) Dr. Stagner's comments on the labor-management symposium: Some needed corrections. *Personnel Psychol.*, 1962, 15(2), 89-91.—The author objects to certain statements in Stagner's comments on his presentation in a symposium on labor-management and

refers to relevant sections of his original paper. He stresses the theme that psychologists dealing with labor-management issues should work within a wider and more adequate social frame of reference than has been usual and guard against unexamined value assumptions which frequently cloak an uncritical acceptance of management views. In a brief reply, Stagner responds that their points of agreement are more important than their disagreements.—*A. S. Thompson.*

3957. Mason, P. L. Executive selection. *Personnel Pract. Bull.*, 1962, 18(2), 43-52.—This is an overview of methods used for the selection of executives. The trend has been to improve the interview as a technique. (28 ref.)—*J. L. Walker.*

3958. Nangle, John Edward. (Michigan State U.) The effectiveness of communications in preparation for change in an insurance company. *Disser. Abstr.*, 1961, 22(6), 2064.—*Abstract.*

3959. Smith, Bernard. Handbooks for new employees. *Personnel Mgmt.*, 1962, 44(Whole No. 360), 101-107.—Purpose, content, design, form, and distribution are the larger areas discussed. Company handbooks should neither be recruitment booklets nor rule books.—*A. R. Howard.*

ENGINEERING PSYCHOLOGY

3960. Abbey, D. S. (U. Toronto) Partial reversal of control-display relations, body position, and performance on a complex perceptual-motor task. *Percept. mot. Skills*, 1962, 14(1), 34.—The effect of body rotation away from the display panel of the Toronto Complex Coordinator on reversal of control-display axes was investigated. The effects of reversing only the vertical dimension or the horizontal direction for Ss was compared with the more complex reversal of 2 and 3 dimensions simultaneously. Body position was found not to be related to these 2 simpler tasks but performance was significantly different on the 2 tasks.—*W. H. Guertin.*

3961. Bonjer, F. H. What is engineering psychology and what can it contribute to human problems in industry? *Mens Onderneming*, 1962, 16(3), 155-158.—The title of this article is the title of a lecture given by Alphonse Chapanis. He called engineering psychology a subdivision of "human engineering" which in Europe is called "ergonomics." According to Bonjer's summary of this lecture, ergonomics is founded on physiology, medicine, toxicology, anthropometry, sociology, and particularly engineering psychology. The latter is actively studied in America as a result of the tremendous development of industry and machinery. Good communication between man and machine should be stimulated.—*J. A. Lucker.*

3962. Brown, Charles R., & Connolly, Donald W. TED: A tape editor. *USAF ESD tech. docum. Rep.*, 1962, No. 62-218. iii, 9 p.—The principle and operation of a utility program for the PDP-1 computer are described. The program is an aid in the editing or modification of alphanumeric text in that the operator may communicate with the computer in the very alphanumerics of the text itself. It is a computer time-saver in that the modifications and the control instructions for their accomplishments may be prepared at an inexpensive, off-line machine.—*USAF ESD.*

3963. Crawford, B. M., & Kama, W. N. Remote handling of mass. *USAF ASD tech. Rep.*, 1961, No. 61-627. iii, 25 p.—Man's ability to make differential and absolute judgments of remotely handled masses was investigated under simulated weightlessness conditions. Ss made judgments of mass after moving stimulus objects to and fro on an air-bearing table. An Argonne Model 8 Master-Slave Manipulator was used for remote handling. An analysis of the results revealed: (a) remote handling under weightlessness conditions produces increments in just-noticeable differences which are roughly proportional to the mass of the remote manipulator components involved in handling the stimulus objects, (b) differential sensitivity for mass can be improved by increasing the accelerative force imposed upon the stimulus objects, (c) absolute judgments tend to be less under weightlessness conditions for either direct or remote handling, and (d) remote handling tends to produce greater and more variable estimates of both weight and mass.—*USAF ASD*.

3964. Fletcher, John L., & Loeb, Michel. Free field threshold shift and temporary threshold shift reduction as measures of efficiency of ear protective devices. *USA Med. Res. Lab. Rep.*, 1962, No. 539. ii, 12 p.—All devices tested were shown to significantly reduce temporary threshold shift (TTS) from impulse and continuous noise exposure. The insert devices were more effective than the helmet at low frequencies, but the devices were approximately equal in effectiveness at high frequencies. It is believed that the temporary threshold shift reduction (TTSR) technique adds important information regarding the operational efficiency of the ear protectors tested. Because of special problems associated with helmets, it seems particularly desirable to include the TTSR technique in their evaluation. The data suggest that susceptibility to TTS from continuous exposure is not significantly correlated with that from impulse exposure.—*USA MRL*.

3965. Kryter, K. D. Proposed methods for the calculation of the Articulation Index. *USAF ESD tech. docum. Rep.*, 1962, No. 62-35. (Bolt Beranek & Newman Rep. No. 906) 20 p.—The most valid and generally accepted procedure for measuring the ability of a communication system to transmit intelligible speech is to subject the system to a series of so-called speech intelligibility tests. However, speech intelligibility testing is an expensive and time consuming operation that requires laboratory test conditions. In an attempt to short-cut or make unnecessary this type of testing, a procedure has been developed for calculating from physical and acoustical measurements made on a communication system a measure that is indicative of the intelligibility scores that would be obtained for that system under actual test conditions. This measure is called the "Articulation Index" (AI). Methods of calculating AI have been improved and developed to the point where standard methods for its calculation can be proposed for use in the military and industry. The procedures presented in this report should be of benefit to communications engineers responsible for the design and operation of speech communication systems. (7 tables, 15 fig., 19 ref.)—*USAF ESD*.

3966. Loveless, N. E. (Queen's Coll., Dundee, Scotland) Direction-of-motion stereotypes: A review. *Ergonomics*, 1962, 5(2), 357-383.—"The ef-

fects of directional relationships between controls and displays are examined. . . . Methods of investigation are discussed." (70 ref.)—B. T. Jensen.

3967. Narva, Marshall Allan. (U. Maryland) Effects of operational experience on performance with certain display-control relationships. *Dissert. Abstr.*, 1961, 22(6), 2081-2082.—*Abstract*.

3968. Pigg, L. D. (Aerospace Medical Lab.) Human engineering principles of design for in-space maintenance. *USAF ASD tech. Rep.*, 1961, No. 61-629. 10 p.—Results of research on problems related to human performance of maintenance actions in space systems are reviewed. The interactions of sensory, psychomotor, and motor functions are discussed, along with problems of remote-handling applications in the space environment.—*USAF ASD*.

3969. Shephard, A. H., Abbey, D. S., & Humphries, M. (U. Toronto) Age and sex in relation to perceptual-motor performance on several control-display relations on the TCC. *Percept. mot. Skills*, 1962, 14(1), 103-118.—Results of investigations with the Toronto Complex Coordinator generally indicated that age, sex, and task together determined level of performance of 9 measures. Level of performance for the 3 tasks generally was ordered Standard, Reverse, and Out-of-Phase, with the Standard Task showing the largest number of matches, smallest number of errors, etc. Male performance was generally superior to female. Most of the curves for performance as a function of age were U- or inverted U-shaped with superior levels of performance in the middle age ranges. Results are examined in terms of a prior learning of directional relations hypothesis and other hypotheses.—W. H. Guertin.

3970. Stuntz, Stephen E. International language for aviation: A review by Air Force sponsored research from 1952 to 1961. *USAF ESD tech. docum. Rep.*, 1962, No. 62-14. 72 p.—The administrative provisions for this research are briefly reviewed. In Part I, reports of research are categorized and discussed under these topics: communication in English with non-native English speakers, comparative effectiveness of ICAO and United States-United Kingdom phraseologies, operational communications, voice transmission of numerals, basic and theoretical findings, and miscellaneous secondarily developments. A bibliography of 74 references comprises Part II. An annotated bibliography of all reports, arranged by contracts, appears as Appendix I.—*USAF ESD*.

3971. Webster, J. C., & Rubin, E. R. (USN Electronics Lab., San Diego, Calif.) Noise attenuation of ear-protective devices. *Sound*, 1962, 1(5), 34-46.—10 ear-protective devices—3 plugs, 2 muffs, 2 phone-in-muff combinations, 1 muff in protective helmet, 1 phone-in-muff in protective helmet, and 1 plug-muff combination—were tested for noise attenuation. The method of binaural threshold shift of $\frac{1}{2}$ -octave bands of noise (occluded ears minus open ears) using 3 trials on 5 Ss was used. Only in the frequency range from 60-300 cycles per second were plugs better than the better muffs. All devices gave more attenuation as the frequency region increased from low to high, except the Zwislocki resonant plug, which gave somewhat less attenuation in the high-frequency region.—*Journal abstract*.

Displays

3972. Baker, J. D., & Whitehurst, A. J. A comparison of two logic symbol coding techniques in a simulated digital device maintenance environment. *USAF ESD tech. docum. Rep.*, 1962, No. 62-196. 111 p.—This study was designed to evaluate which of 2 techniques is better for encoding the logic symbols in detailed logic diagrams to convey information about digital circuits. One technique employed shape encoding to differentiate basic logic functions, and the other used alphabetic identifiers. The findings from this study showed that using shape encoded symbols in simulated detailed logic diagrams resulted in a significant reduction in the time required to solve maintenance type problems. Based upon observations made during the design and conduct of this study, 2 sets of recommendations are made. 1 set of recommendations has to do with research methodology, the 2nd with operational conditions. Special programmed handbooks were prepared for the pretraining and orientation phases of this study. These are included in an appendix to this report.—*USAF ESD.*

3973. Blackwell, H. Richard; Ohmart, James G., & Brainerd, Robert W. (Ohio State U.) Experimental evaluation of optical enhancement of literal visual displays. *USAF ASD tech. Rep.*, 1961, No. 61-568. 66 p.—“The visual displays of aerial views were obtained by optical enhancement of photographic negatives of various areas in a terrain model. Two enhancement techniques were used: manipulation of photographic processing to alter luminance contrast values and optical spatial filtering to suppress or eliminate selected sizes of luminance discontinuities. Performance was measured in terms of probability of target detection under conditions of veiling light. When the probability of detection was low or moderate at a gamma of 1, increases in gamma were accompanied by increases in the probability of detection; when it was high at a gamma of 1, detection probability either remained unchanged or decreased slightly with increasing gamma. Of the optical filtering masks studied, some always reduced the probability of target detection, whereas the most effective increased this probability at the lower values of detection probability.”—*E. L. Borrowman.*

3974. Buschke, Herman. (Albert Einstein Coll. Medicine) Registration in and retrieval from immediate memory. *Life Sci.*, 1962, No. 6, 257-261.—“Visual displays consisting of any of the 15 possible combinations of four lights at the corners of a rectangle, were presented by teletype program to 67 normal adults. These randomly chosen displays were presented once a second for 200 milliseconds in series of 16 displays each. There were sixteen such series, separated from each other by eight second silent periods. Every series of 16 displays contained 4 repetitions of displays already in the same series. . . . The S's instructed to press a microswitch whenever they saw a repetition of any display already seen in the same series. . . . [Significantly] correct responses ($p < 0.001$ by the Kolmogorov-Smirnov test) were made for series containing one, two and three displays. Correct responses fell sharply for series of four displays ($p > 0.05$), rose slightly but significantly for series of five displays ($p < 0.01$), and remained at chance levels ($p > 0.05$) for series containing six or more displays.”—*C. T. Morgan.*

3975. Conrad, R. (Cambridge U.) The location of figures in alpha-numeric codes. *Ergonomics*, 1962, 5(2), 403-407.—33 postmen were presented with combinations of 4 letters and 2 figures. Figures were always paired but in different positions. Fewest errors in reproduction occurred when the figures were in positions 4 and 5.—*B. T. Jensen.*

3976. Ellis, H. C., Bessemer, D. W., Devine, J. V., & Trafton, C. L. (U. New Mexico) Recognition of random tactual shapes following pre-differentiation training. *Percept. mot. Skills*, 1962, 14(1), 99-102.—3 independent groups of Ss were employed, receiving either distinctiveness, equivalence, or observation training. No superiority in shape recognition occurred as a result of distinctiveness training per se; however, a significant reduction in recognition efficiency occurred as a result of equivalence training. Results were interpreted as being consistent with the hypothesis of acquired equivalence of cues but not consistent with the hypothesis of acquired distinctiveness of cues. An alternative explanation of the results pertaining to equivalence training was proposed, which emphasized the relevance of the response label to the shape.—*W. H. Guertin.*

3977. Goldiamond, Israel. (Arizona State U.) Ongoing visual monitoring. *USAF ESD tech. Rep.*, 1961, No. 61-22. 18 p.—“Procedures for controlled alteration and definition of ongoing reading are presented. Reading not only has intrinsic interest, but can also be considered as a form of visual monitoring of a complex display, in which the behaviors required have linear sequences. Implications for other types of monitoring are presented. Commercially available equipment is discussed which can be used for scheduled presentation and control of responses in major psychophysical methods, for both human and animal monitoring research.”—*N. B. Gordon.*

3978. Hough, Paul V. C. (Brookhaven National Lab., Upton, N. Y.) General purpose visual input for a computer. *Ann. N. Y. Acad. Sci.*, 1962, 99, 323-334.—Visual information is a 3-dimensional space distribution of light source intensity reducible to pairs of 2-dimensional descriptions. Computers reproduce visual images by showing mean light density distributions in a large number of area elements. An alternate and more efficient method is to show contour line representation. The Hough-Powell digitizer which can use either method is described. Computer methods in process of development for recognizing patterns and visual events in time are also described.—*B. S. Aaronson.*

3979. Mezei, Árpád. (Hungarian Acad. Sciences) A színek információközvetítő értékeinek különbségeiről. [The value of different colors in conveying information.] *Pszichol. Taulmányok*, 1, 1958, 121-125.—In order to evaluate P. M. Fitts' theory on “matching” stimuli and responses in conditioning, experiments were designed to show that different colors as conditioned stimuli for motor responses are not equally adapted to elicit these responses. The motor response was executed with less errors if the color chosen for conditioned stimuli was from the 2 extremes of the spectrum, while colors from the central part of the spectrum elicited a greater number of errors. The writer concludes that the specific information value of different colors is seemingly unequal. (Russian & English summaries)—*E. Friedman.*

3980. Smith, Sidney L. (Mitre Corp.) Angular estimation. *J. appl. Psychol.*, 1962, 46(4), 240-246.—In one study, 10 Ss estimated the directional trend (heading) of simulated radar trials, using different response modes; rotary switch adjustment permitted better accuracy than numerical estimation. Varying the displayed length of the simulated trials from $\frac{1}{8}$ to $1\frac{1}{2}$ inches had no apparent effect on estimation accuracy. 5 civilian Ss proved more accurate than 5 airmen. In a 2nd study, 20 Ss estimated the angular position of lines varying in length from $\frac{1}{8}$ to 1 inch, using equipment which permitted switch adjustment and numerical estimation only to the nearest 10 degrees. Results were the same as before. In addition, this report notes differences in estimation accuracy and bias related to the actual angle of displayed lines over a 360-degree range, as well as biasing effects of right- vs. left-handed switch adjustment.—*Journal abstract.*

3981. Teichner, Warren H., & Sadler, Ernest. (U. Massachusetts) Effects of exposure time and density on visual symbol identification. *J. exp. Psychol.*, 1962, 63(4), 376-380.—12 college students were presented with displays of alphabetic letters which varied in number of different letter categories, letter density, and exposure time. On the basis of a distinction between perceptual capacity and short-term memory, it was predicted that at short exposure times, increasing density would increase letter identification, but that at longer exposure times the opposite effect would be obtained. This prediction was confirmed, and several specific conclusions regarding percent correct identification as a function of exposure time and number of symbol categories were also noted.—*J. Arbit.*

3982. York, Cyrus Michael. (U. Maryland) Behavioral efficiency in a visual monitoring task as a function of signal rate and observer age. *Dissert. Abstr.*, 1961, 22(6), 2085.—*Abstract.*

Controls

3983. Gibbs, C. B. (Cambridge U.) Controller design: Interactions of controlling limbs, time-lags and gain in positional and velocity systems. *Ergonomics*, 1962, 5(2), 385-403.—The effectiveness of thumb, hand, and forearm in control, using a joystick, were compared. "Increases of gain and lag may have very different effects upon control, depending on whether they are varied independently or together. A separate increase in either will tend to worsen performance; . . . An increase of gain and lag together may, however, give compensatory effects." Appendices contain numerical data for figures in text.—B. T. Jensen.

SIGNS & LEGIBILITY

3984. Alluisi, E. A., & Adams, O. S. (Human Factors Research Dept., Lockheed-Georgia Co.) Predicting letter preferences: Aesthetics and filtering in man. *Percept. mot. Skills*, 1962, 14(1), 123-131.—Esthetic rank-preference for the English capital letters is predicted from 4 variables: frequency of use in the language, frequency in use as initial letter in family names, frequency as initial letter in words, and the aesthetic quality of the 4 completely closed capitals (B, D, O, Q). R was .91.—W. H. Guertin.

3985. De Young, Kenneth Norman. (U. Minnesota) Word recognition in the upper and lower

visual fields. *Dissert. Abstr.*, 1961, 22(6), 2074.—*Abstract.*

3986. Krylov, A. A. (Leningrad, USSR) Vliianie velichiny diametra shkaly na chitaemost' strelochnykh kontrol'no-izmeritel'nykh priborov. [Effect of dial size on the legibility of pointer-type measuring devices.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 1, 89-92.—Dials of different diameters (50, 60, 90, 120, and 150 mm.) were presented tachistoscopically to 5 Ss (age 19-26). All the other elements of the dials were constant (size of numbers, thickness of lines, etc.). RT and accuracy were measured. Results show that the increase in the dial size is accompanied by a decrease in accuracy and in reading time.—A. Cuk.

DRIVING, ACCIDENTS, SAFETY

3987. Selzer, Melvin L., & Payne, Charles E. (U. Michigan Medical School, Ann Arbor) Automobile accidents, suicide and unconscious motivation. *Amer. J. Psychiat.*, 1962, 119(3), 237-240.—"Thirty alcoholic and 30 non-alcoholic male psychiatric patients were evaluated to determine past serious suicidal preoccupation or previous suicidal attempts. These data were correlated with the total number of automobile accidents for which the patient was responsible. The 33 patients deemed to be suicidal averaged 2.70 accidents per patient whereas the 27 non-suicidal patients averaged 1.30 accidents. In the 30-patient alcoholic group, the 17 suicidal patients were responsible for 63 accidents, whereas the 13 non-suicidal patients were responsible for 24 accidents, yielding mean values of 3.70 and 1.77 accidents per person respectively. These differences were statistically significant."—N. H. Pronko.

ADVERTISING & CONSUMER PSYCHOLOGY

3988. Appel, Valentine, & Hernandez Randolph J. (Marketing, Merchandising, & Research, Inc., Flushing, N. Y.) Show-Z-Minx: A note on code lettering. *J. appl. Psychol.*, 1962, 46(4), 263-264.—9 of the 26 letters of the alphabet can be read upside down as well as right side up. The use of these letters as code designations in blind product testing can have a significant effect upon respondents' perceptions of the product, particularly when there is the possibility of settling or separation. An incident is reported in which the use of one of these letters had the effect of introducing irrelevant sources of variance into a product test of a packaged dry food.—*Journal abstract.*

3989. Bullock, Henry A. (Texas Southern U.) Consumer motivations in black and white: Part I. *Harv. Bus. Rev.*, 1961, 39(3), 89-104.—National advertising must be quite subtle in its appeal to the Negro if it is to avoid alienation of the more lucrative white market. Inadequacies in early studies are described. New research takes into consideration "the need to belong," "conflicting self-image," "need for security," "role confusion," "economic anxieties," "credit buying," "product attitudes" and related concepts.—C. F. X. Youngberg.

3990. Bullock, H. A. (Texas Southern U.) Consumer motivations in black and white. Part II. *Harv. Bus. Rev.*, 1961, 39(4), 110-124.—Based on an analysis of responses of more than 1600 Negroes and whites to tests and interviews the 3 major areas discussed are: (a) some motivations common to both groups of consumers, (b) media through which the

2 groups can be reached simultaneously, and (c) types of advertising patterns likely to have greatest impact on the largest number of the 2 groups.—C. F. X. Youngberg.

3991. Compton, Norma H. (U. Maryland) Personal attributes of color and design preferences in clothing fabrics. *J. Psychol.*, 1962, 54(1), 191-195.—An exploratory study conducted in the fall of 1961 resulted in several statistically significant differences in personality and occupational interests between groups of college students classified according to specified color and design preferences in clothing fabrics. Students preferring deep shades and saturated colors scored higher in sociability than students preferring tints. Students choosing small fabric designs were differentiated from those choosing large designs by higher scores in femininity and good impression (as measured by the California Psychological Inventory) and by the possession of interests similar to those of people engaged in clothing merchandising.—*Author abstract.*

3992. Mileff, Edward, & Irwin, Leslie W. (San Diego State Coll.) Discriminatory power of high school seniors to evaluate advertisements in popular periodicals on the authenticity of their health claims. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 249-254.—The purpose of the study was to determine how well high school seniors could evaluate the authenticity of health claims made in advertisements from current best-selling periodicals. 881 students evaluated 47 advertisements which had previously been validated for use in the study by juries of experts. For student evaluation, the advertisements were organized in 2 parts and administered at separate classroom periods. A 5-point rating scale

describing the authenticity of the expressed health claims in the advertisements was used. Substantial numbers of seniors reflected low discriminatory power in their responses, although girls did significantly better than boys.—*Journal abstract.*

3993. Singh, Paras N., & Huang, Sophia C. (Ohio State U.) Some socio-cultural and psychological determinants of advertising in India: A comparative study. *J. soc. Psychol.*, 1962, 57(1), 113-121.—The present study was designed to investigate similarities and differences between Indian and American advertisements and relate these findings to certain socioeconomic and cultural conditions in the 2 countries. *Issues of Life* and the *Illustrated Weekly of India* were evaluated on the following variables: size of advertisements, use of pictures, use of color, type of appeal, and isolation. It was found that the American publication used more illustrations, more color, more personal appeals, and more isolation. The Indian advertisements were typically in black-and-white, crowded, and verbal in appeal.—*Author abstract.*

3994. Wells, William D. (Rutgers U.) Measuring readiness to buy. *Harv. bus. Rev.*, 1961, 39(4), 81-87.—The range of consumer predispositions to buy or not to buy a given product or service can be described in terms of a psychological continuum. The point on the continuum at which an individual stands can be determined by attitude scaling. By comparing indices of readiness to buy with actual purchases it becomes possible to uncover trouble spots. Subanalyses by demographic and other respondent characteristics may further point up needed shifts in advertising or other aspects of the marketing strategy.—C. F. X. Youngberg.

BRIEF SUBJECT INDEX

This index supplements, but does not duplicate, the classification of abstracts given in the Table of Contents. It is assumed that the reader will have scanned whatever categories of classification interest him and that he will use this index only for cross references or for subjects that are more specific than the general categories of the classification. When many numbers are encountered under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

 Cancer, 2685, 2811, 3623, 3761, 3762, 3763, 3765, 3771
 Cardiovascular (See also Blood; Heart), 3759
 Casework (See Social casework)
 Cat, 2537, 2543, 2545, 2547, 2555, 2562, 2565, 2567, 2573, 2577, 2579, 2582, 2588, 2589, 2591, 2642, 2710, 2717, 2755
 Catatonia, 3678
 Categorical behavior, 3024, 3659, 3702
 Catholic, 2977, 3006, 3007
 Causation & Causality, 2202
 Central nervous system (See Nervous system/central)
 Cerebellum, 2584
 Cerebral cortex (See also Brain; Cortex), 2540, 2543, 2554, 2578, 2588, 3733
 Cerebral palsy (See also Physical handicap), 3481, 3517, 3553, 3552, 3554, 3753
 Character, 3266, 3722
 Cheating, 3859
 Check-list (See also Inventory), 3145, 3177, 3838
 Chicken, 2569, 2619, 2680, 2681, 2682, 2689, 2690, 2695, 2696, 2710, 2802
 Child guidance (See Guidance/child)
 Childhood & children (See also next headings), 2664, 2667, 2911, 2916, 2918, 2921, 2924, 2925, 2935, 3013, 3070, 3112, 3140, 3269, 3337, 3356, 3385, 3413, 3431, 3435, 3436, 3442, 3487, 3488, 3489, 3492, 3498, 3499, 3511, 3512, 3523, 3525, 3548, 3549, 3583, 3595, 3763, 3767, 3798, 3850, 3856, 3875, 3877
 Childhood/ability, 2305, 2393, 2830, 3117, 3857, 3886
 Childhood/anxiety in, 3106, 3823, 3867
 Childhood/behavior problems, 2922, 3259, 3428
 Childhood/concepts in, 2818, 2835, 2841, 2842, 2845, 2865, 2970, 2878, 2937, 3560

BRIEF SUBJECT INDEX

- Childhood/development in, 2242, 2817, 2829, 2836, 2840, 2844, 2849, 2850, 2867, 2868, 2876, 2884, 2887, 2894, 2912, 3111, 3223, 3422
- Childhood/emotional disturbances in, 2919, 3232, 3335, 3379, 3429, 3433, 3434, 3439, 3684
- Childhood/learning in, 2414, 2490, 2531, 2906, 3491, 3526, 3799
- Childhood/perception in, 2301, 2853, 2869, 2874, 3807, 3808
- Childhood/personality (See Personality/childhood)
- Childhood/preschool, 2828, 2831, 2838, 2839, 2862, 2863, 2879, 2886, 2904, 3486, 3803, 3881
- Childhood/retarded (See Mental retardation)
- Childhood/schizophrenia in (See Schizophrenia/childhood)
- Child psychiatry, 3116, 3331, 3452, 3471, 3475
- Child psychology, 2241, 2832
- Child rearing, 2910, 2913, 2917, 2921, 2926, 2929, 2930, 2932, 3544, 3458, 3681
- Children's Manifest Anxiety Scale, 2905, 3867
- Chimpanzee, 2709, 2747, 2800
- Chi square, 2230
- Chlorpromazine, 2624, 2625, 2632, 2643, 3230, 3335, 3341
- Choice behavior (See also Decision making; Probability learning; Problem-solving), 2524, 2862
- Choline, acetyl, 2540, 2602, 2607, 2628
- Class (See Socioeconomic status)
- Client-centered therapy (See Psychotherapy/nondirective)
- Clinic, 2888, 3555, 3563
- Clinical psychology (See also specific aspects of Clinical psychology), 2228, 2254, 3234, 3373
- Clinical judgment, 3113, 3220, 3221, 3225, 3281
- Coding (See also Displays), 3972
- Cognition (See also Thinking), 2502, 2814, 2855, 2880, 3129, 3254, 3657, 3686
- Cold, 2657
- College (See also Education; School), 2245, 3016, 3829, 3830, 3834
- College student (See Achievement/college)
- Color (See also next headings), 2410, 3086, 3191, 3279, 3979, 3991
- Color perception, 2331, 2332, 2333, 2338, 2679
- Color vision, 2304, 2330, 2592, 2594, 2716, 2742
- Communication (See also Information; Language; Speech; Verbal behavior), 2385, 3018, 3071, 3958
- Community (See also Culture; Group), 2227, 2990, 3790
- Comparative psychology (See also Animal psychology), 2261, 2539, 2726
- Competition (See also Conflict; Motivation), 3039
- Compulsion, 3372, 3739
- Computer & computation, 2269, 2379, 2384, 2510, 2572, 3962, 3978, 3812
- Concept (See also Abstraction; Childhood/concepts in; Concept formation; Generalization; Thinking), 2842, 2844, 2870, 2875, 2878, 2937, 3068, 3868
- Concept formation, 2865, 3495, 3531, 3702
- Conditioned emotional response, 2646
- Conditioned galvanic skin response (See also Galvanic skin response), 2456
- Conditioned reflex (See also Conditioning/classical; Conditioned response), 2211, 2452, 2539, 2542, 2551, 2601, 2608, 2650, 2729, 2736
- Conditioned response, 2447, 2545, 2582, 2632, 2647, 2733, 3389, 3503
- Conditioning (See also specific kinds below), 2280, 2549, 2609, 2645, 2678, 2690, 2756, 2760, 3249, 3277, 3381, 3523, 3754, 3846, 3979
- Conditioning/avoidance, 2553, 2565, 2613, 2615, 2618, 2651, 2755, 2760, 2440
- Conditioning/classical, 2432, 2577, 2658, 2719, 2730, 2735, 2739, 2741
- Conditioning/eyelid, 2439, 2444, 2731, 2738
- Conditioning/operant, 2443, 2446, 2453, 2454, 2457, 2487, 2491, 2539, 2563, 2625, 2643, 2648, 2700, 2737, 2748, 2752, 2782, 2793, 2794, 2861, 3384, 3402, 3562, 3684
- Conditioning/verbal, 2441, 2442, 2443, 2449, 2450, 2451, 2458, 2474, 2488, 2492, 2854, 2856, 3206, 3370, 3660, 3680
- Conflict (See also Learning/avoidance; Competition), 2414, 2522, 2624, 2750, 2751, 2848, 2987, 3257, 3405, 3451
- Conformity (See also Authoritarianism; Culture; Power), 3013, 3016, 3037, 3230, 3653, 3674
- Consciousness (See also Attention; Awareness; Sleep; Unconscious), 2425, 2704
- Consonant, 2381, 2382, 3504, 3547
- Consumer behavior, 3994
- Contrast, 2340
- Contribution & criticism (See also Adler; Dewey; Freud; Jung; Pavlov; Piaget; Weber), 3135
- Control (See also Display), 3960, 3968, 3969, 3983
- Convulsion (See also Electroconvulsive Shock; Epilepsy), 2812
- Coordination, 2418, 2288, 2536
- Corpus callosum, 2546
- Correlation, 2222, 2233, 2234, 2237
- Cortex (See also Cerebral cortex), 2543, 2570, 2579, 2620
- Counseling (See also College counseling; Guidance; Interviewing), 3650, 3902
- Counselor, 3459, 3863, 3901
- Counting, 3045
- Courtship, 2801, 2804, 3003, 3458
- Creativity (See also Art; Music; Thinking), 2508, 3027, 3205, 3362, 3364
- Crime & criminals (See also Conformity; Delinquency/juvenile; Law; Prison), 3168, 3613
- Critical flicker fusion (See Flicker fusion)
- Critical incident, 3572
- Critical period, 2802, 2887
- Cross cultural differences (See also Culture), 2830, 2975, 2982, 2986, 3060, 3843, 3847, 3993
- Culture (See also Community; Conformity; Cultures; Group; Race), 3082, 3199, 3627
- Curiosity, 3307
- Cybernetics, 2534, 3788
- Dark adaptation, 2592, 2598
- Data processing, 2575
- Day dreaming (See Fantasy)
- Deafness, 2283, 2377, 3561
- Decision making (See also Choice behavior; Probability learning; Problem solving), 2946, 2971, 2990, 3048, 3060, 3671, 3929
- Defense mechanism (See also Defensiveness; Defense/perceptual; the various defense mechanisms), 2349, 2529, 3314
- Defense/perceptual (See also Defense mechanism), 2336, 3279, 3287, 3288, 3289, 3293, 3295, 3661
- Defensiveness (See also Defense mechanism), 3152, 3243, 3297
- Delayed reaction & response, 3194
- Delinquency/juvenile (See also Conformity; Crime & criminals), 3628, 3818
- Dependency-independency, 2866, 2925, 3198, 3367, 3689, 3698
- Depersonalization, 3739
- Depression (See also Emotion; Manic-Depressive psychosis), 2622, 2892, 3209, 3218, 3329, 3475, 3661, 3665, 3667, 3720, 3721, 3723, 3724, 3726, 3736, 3784
- Deprivation (See also Deprivation/Sensory; Isolation; several kinds of deprivation), 2705, 2706, 3604, 3783
- Deprivation/sensory (See also Isolation/perceptual), 2395, 2681, 3490, 3658
- Depth perception (See Perception/depth)
- Detection, 2233, 2374, 2427, 3038, 3973, 3977
- Development, 2808, 2844, 2876, 2880, 2891, 2897, 2903, 3223

 Statistics/estimation, 3096
 Status (See also Social class; Social structure; Socioeconomic status), 2845, 3949
 Stereotype, 2978, 3020, 3294, 3824
 Stimulation (See also Brain), 2621, 2626, 2687, 2688, 3082
 Stimulation/central, 2560, 2563
 Stimulus, 2284, 2292, 2427, 2485, 2694, 2696, 2697, 2729, 3042, 3676
 Stimulus generalization (See Generalization/stimulus)
 Stomach, 3755
 Stress (See also next heading; Conflict), 2475, 2656, 2689, 3162, 3233, 3256, 3302, 3496, 3508, 3774, 3859
 Stress (physiological), 2603, 2604, 2657, 3769
 Strong Vocational Interest Blank, 3846, 3894, 3898, 3899, 3900
 Student (See also next headings), 2429, 2499, 2514, 2975, 2993, 2998, 3005, 3025, 3060, 3097, 3279, 3809, 3840, 3843, 3860, 3887, 3891, 3925
 Student/graduate, 2909, 3440
 Student/high school, 2422, 2423, 2517, 2875, 2934, 3009, 3019, 3141, 3811, 3815, 3825, 3826, 3833, 3836, 3842, 3844, 3846, 3848, 3858, 3949, 3992
 Student/medical, 2226, 2249, 2252, 2415, 3838
 Stuttering (See also Speech/defective), 3499, 3503, 3507, 3508, 3509
 Subception (See also Defense/perceptual), 2292, 3303, 2307, 3292, 3832
 Success (See also Achievement), 2997, 3756
 Suggestion (See also Hypnosis), 2395, 3758
 Suicide (See also Homicide), 3475, 3622, 3623, 3624, 3625, 3626, 3627, 3987
 Supervision (See also Authority; Executive; Leadership), 3060, 3588, 3955
 Survey (See also Check-list; Guilford-Zimmerman Temperament Survey; Inventory; Questionnaire; Scale; Test), 3142, 3195
 Symbol, 2896, 3320, 3688
 Symbolic process, 2438
 Symbolism, 3190
 Sympathetic nervous system (See Nervous system/autonomic)
 Symposium, 2269, 3956
 Tachistoscope, 3293, 3985
 Tactual (See also Touch), 2273, 2353, 2358, 2867, 3542, 3976
 Talent (See also Ability), 3857
 Tapping (See also Coordination), 2362
 Target, 2345, 3973
 Taste (See also Food), 2552, 2792
 TAT (See also Thematic Apperception Test), 2455, 3146, 3163, 3192, 3195, 3202, 3204, 3235, 3388, 3396, 3586, 3859, 3915
 Taylor Manifest Anxiety Scale, 3113, 3283, 3888
 Teacher, 3840, 3889, 3890, 3891
 Teaching (See also next headings; Television/educational), 2253, 2259, 3600, 3802, 3810, 3902
 Teaching machine (See also Programmed instruction), 2857, 3800, 3813, 3818
 Teaching success, 3809
 Teaching/television (See Television/educational)
 Television (See also next heading), 2404, 3070
 Television/educational, 3815, 3817
 Temperature (See also next heading), 2537, 2605, 2657, 2756, 3932
 Tension (See also Conflict; Stress), 2461
 Test & testing (See also next headings; Air Force; Bender-Gestalt; California Psychological Inventory; Draw-a-Man; Draw-a-Person; Performance Test; Progressive Matrices Test; Projective technique; Rorschach; Sentence Completion; Stanford-Binet; Thematic Apperception), 2450, 2480, 2665, 2948, 2953, 2954, 2964, 3016, 3079, 3260, 3267, 3268, 3448, 3516, 3524, 3525, 3531, 3540, 3547, 3551, 3581, 3582, 3584, 3586, 3595, 3665, 3829, 3866, 3868, 3870, 3875, 3876, 3879, 3906
 Test/achievement, 3527, 3581, 3882, 3893, 3884
 Test/aptitude, 3085, 3162, 3880, 3893, 3911
 Test/intelligence (See also Intelligence tests), 2877, 3095, 3117, 3878
 Test/personality (See also specific tests), 2480, 3109, 3114, 3151, 3156, 3159, 3651, 3910
 Test/program, 3864
 Thalamus, 2552, 2567, 2584
 Thematic Apperception Test (See also TAT), 2974, 3225
 Therapy (See also Occupational Therapy; Psychiatry; Psychoanalysis; Psychotherapy; Treatment), 3399, 3407, 3467
 Thinking (See also Abstraction; Cognition), 2207, 2818, 2839, 2840, 2841, 2868, 3091, 3205, 3228, 3242, 3332, 3368, 3624, 3712, 3924
 Thirst (See also Water deprivation), 2566, 2586
 Threat, 3029, 3278, 3774
 Threshold (See also several modalities), 2339, 2342, 2347, 2348, 2358, 2364, 2420, 3515
 Time (See also next headings), 2617
 Time estimation, 2273, 2282, 2286, 2457, 2635, 2749, 2949, 3479, 3716, 3718
 Time perception (See Perception/time)
 Tone (See also Audition), 2366
 Tough (See also Skin), 2546
 Toxic, 2554
 Tracking, 3921, 3967
 Training (See also next headings), 2728, 3703, 3909, 3976
 Training/psychology, 2248, 3459, 3572
 Trait (See also Personality), 3089
 Tranquillizer (See also Drug effects), 2623, 3340, 3342
 Transfer (See also Generalization/stimulus; Set/learning), 2483, 2747, 3564, 3810, 3921
 Transference, 3372, 3444, 3742
 Transposition, 2859
 Treatment (See also Therapy), 3360, 3420, 3741
 Twins (See also next heading), 2952
 Twins/identical, 3357
 Type, 2974, 3652
 Ulcer, 3751, 3752, 3761, 3773
 Unconscious, 3368
 Under achievement (See Achievement/over- & under-)
 Union, 3948
 Union-management relations, 3496, 3941
 United States, 2993
 Universities, 2265, 2268
 Urination, 2609, 3322, 3597, 3730, 3754
 USSR, 2303, 2539, 2993
 Validity (See also next heading), 2948, 3008, 3050, 3088, 3092, 3108, 3114, 3155, 3231, 3276, 3908, 3910, 3923
 Validity/construct, 3189, 3448
 Value, 3023, 3059, 3149, 3274, 3453, 3847, 3949
 Variance (See also next heading), 3183
 Vascular & vasomotor (See also Cardiovascular), 2634
 Verbal ability (See Ability/verbal)
 Verbal behavior, 2201, 2831, 3282, 3370, 3660, 3680, 3868
 Verbal conditioning (See Conditioning/verbal)
 Verbal learning (See Learning/verbal)
 Verbal mediation (See Mediation)
 Verbal reinforcement (See Reinforcement/verbal)
 Vestibular sense, 2365, 2610, 3933
 Veteran (See also Personnel/military), 3340, 3864
 Vibration, 2399, 3935
 Vigilance (See also Arousal; Attention), 2427, 3938, 3982
 Vision (See also next headings; Dark adaptation; Eye; Flicker fusion), 2319, 2345, 3810, 3977
 Vision/brightness (See Brightness)
 Vision/color (See Color)
 Vision/eye movements (See Eye movements)
 Visual accommodation (See Accommodation)
 Visual acuity, 3284, 3920
 Visual adaptation (See Dark adaptation; Light adaptation)
 Visual aftereffect (See Aftereffect)
 Visual field, 2288, 3985
 Visual illusion (See Illusion)
 Visual movement (See Perception/motion)
 Visual perception (See also Aftereffect; Autokinetic effect; Illusion; Perception; Subception), 2276, 2284, 2293, 2315, 2321, 2328, 2338, 3532, 3536, 3980, 3981
 Visual perception/depth (See Perception/depth)
 Visual perception/size (See Perception/size)
 Visual sensitivity (See also several kinds of sensitivity), 2716
 Visual threshold (See also several kinds of thresholds), 2336, 2341, 2342, 2347, 2420
 Vitamin, 2658
 Vocabulary, 2875, 3068, 3124, 3226, 3582, 3801
 Vocalization, 2737, 2800
 Vocational guidance (See Guidance/vocational)
 Vocational rehabilitation (See Rehabilitation/vocational)
 Vowel, 3285
 Wage, 3939
 War, 2662
 Water (See also next headings), 2373
 Water deprivation, 2700, 2703
 Weber, 2281
 Wechsler Adult Intelligence Scale, 2891, 3102, 3103, 3119, 3214, 3217, 3227, 3241, 3571, 3599, 3679, 3876
 Wechsler-Bellevue Intelligence Scale, 3140, 3687
 Wechsler Intelligence Scale for Children, 2872, 2891, 3107, 3116, 3127, 3140, 3216, 3557, 3595, 3867
 Weightlessness (See also Gravity), 3963
 Wit (See Humor)
 Woman, 3614
 Word (See also Association/word; Language), 2471, 3985
 Work (See also Job; Occupation; Task), 2657, 2668, 2995, 3667, 3892, 3927, 3937, 3941, 3944, 3949
 Worker (See also Employee), 3081, 3824, 3916, 3932, 3948
 Writing (See also Handwriting), 3087
 X-radiation (See Radiation)
 Youth, 2939, 3632

Psychological Abstracts

VOLUME 37

JUNE 1963

NUMBER 3

EDITORIAL NOTES

In the fall of 1962, *Soviet psychology and psychiatry* began publication on a quarterly basis. It consists of selected articles from Soviet journals in English translation. The first issue contained 3 articles on conditioning, 1 on perception, 3 on cognition, 3 on psychiatry, and 1 on general principles. Several distinguished psychologists are on the Advisory Committee. Published by International Arts and Sciences Press, 156 Fifth Avenue, New York 10, subscription is \$35.00 per year.

* * *

From January, 1963 the psychiatric journal long known as the *Journal of Mental Science* will appear as the *British Journal of Psychiatry*.—C. T. Morgan.

GENERAL

OBITUARIES

3995. Anon. John Davidson Ketchum. *Canad. J. Psychol.*, 1962, 16(3), 169.—Obituary.

3996. Bresson, François. In memoriam: Paul Guillaume (1878-1962). *Psychol. Franc.*, 1962, 7(3), 178-179.—Obituary.—C. J. Adkins.

3997. Brodsky, Paul. Lydia Sicher: 1890-1962. *J. indiv. Psychol.*, 1962, 18(2), 184-186.—Obituary.—A. R. Howard.

3998. Hunt, William A. (Northwestern U.) Carney Landis: 1897-1962. *Amer. J. Psychol.*, 1962, 75(3), 506-509.—Obituary.—R. D. Nance.

3999. Rapaport, I. (645 W. 160th St., NYC) In memoriam: Theodore Simon (1873-1961). *Amer. J. ment. Defic.*, 1962, 67(3), 367-368.—An obituary and portrait.—V. S. Sexton.

HISTORY & BIOGRAPHY

4000. Ansbacher, Heinz L. (U. Vermont) Was Adler a disciple of Freud? A reply. *J. indiv. Psychol.*, 1962, 18(2), 126-135.—Evidence to support Adler's denial is presented.—A. R. Howard.

4001. Cardno, J. A. (U. Tasmania, Hobart, Australia) The experimental upsurge: 1797-1874. *Amer. J. Psychol.*, 1962, 75(3), 499-501.—Production during this period was assessed by extracting relevant entries from Rand's bibliography in (J. M. Baldwin (Ed.), *Dictionary of Philosophy and Psychology*, 1905). There are 140 items in the "Experimental and Physiological" section. It is concluded that Boring's notion of an experimental upsurge in psychology at about 1860 is justified. "Experimental is a member of the moderate nouveau-riche family in psychology, by contrast with the old residents in the psychological household, like Abnormal and Insanity."—R. D. Nance.

4002. Maslow, A. H. (Brandeis U.) Was Adler a disciple of Freud? A note. *J. indiv. Psychol.*, 1962, 18(2), 125.—Adler's denial during a personal encounter is recalled.—A. R. Howard.

4003. Naudé, S. M., van der Merwe, A. B., Bartlett, F. C., & Murchison, C. Simon Biesheuval. *Psychol. Afr.*, 1962, 9, 3-13.—Tribute is paid to Biesheuval, founder and director of the National Institute for Personnel Research. 68 of his publications (1935-1959) are listed. There is a full-page photograph of Biesheuval.—J. L. Walker.

4004. Nunberg, H., & Federn, E. (Eds.) *Minutes of the Vienna Psychoanalytic Society, Vol. 1. 1906-1908*. New York: International Univer. Press, 1962. xxxvii, 410 p. \$10.00.—The Wednesday Evening Society which met at Freud's home beginning in 1902 later became the Vienna Psychoanalytic Society. Members of the group during 1906-1908 were A. Freud, D. Adler, A. Bach, G. Bass, A. Brecher, P. Deutsch, E. Federn, P. Frey, M. Graf, A. Hautler, Hugo Heller, E. Hitschmann, E. Hollerung, A. Joachim, M. Kahane, A. Meisl, Otto Rank, R. Reitler, I. Sadger, M. Steiner, W. Stekel, R. von Urbantschitsch, and Fritz Wittels. 1906 was the 5th year of meeting of the group. Rank was the paid secretary. Minutes of 53 scientific meetings are presented including case presentations, papers, book reviews, reviews of the literature, and discussions by participants.—D. Prager.

4005. Postman, Leo (Ed.) (U. California, Berkeley) *Psychology in the making: Histories of selected research problems*. New York: Knopf, 1962. viii, 785 p.—Contributors, in addition to the editor, are: Richard Crutchfield, William Dukes, Harrison Gough, Julian Hochberg, Marjorie Honzik, David Krech, Gerald McClearn, John McKee, Donald MacKinnon, Donald Riley, Mark Rosenzweig, Theodore Sarbin, and Read Tuddenham. Each chapter begins with the 1st modern statement of the problem and its earliest "solution." The historical background of each subject is followed by a survey of present-day schools of thought and experimental methods. Topics covered are: guides to understanding history, cortical localization, hunger and thirst, inheritance of behavior, nativism and empiricism in perception, reward and punishment in human learning, memory for form, nature and measurement of intelligence, clinical and statistical prediction, sucking behavior of mammals, repression, and understanding hypnotic phenomena. References, numbering over 1100 for the whole book, are given at the end of each chapter.—R. D. Nance.

4006. Pratt, Kenneth J. (Los Angeles State Coll.) *Motivation and learning in medieval writings*. *Amer. Psychologist*, 1962, 17(7), 496-500.—Quotations from writings during medieval times (the span in the Western World from 400 to 1400 A.D.) provide discussions and examples of conditioning or

substitute stimulation, compensation, rationalization, projection, learning problems, individual differences, and "the importance of the formative years and of the significance of childhood impressions in the formation of attitudes and resultant behavior." However, "there does not seem to be much that is cumulative, no temporal development or drift, in behavioral knowledge." But "one can grant to many medieval persons rich insights into the behavior of their fellows."—S. J. Lachman.

4007. **Rebelsky, Freda Gould.** (Massachusetts Inst. Technology) **Coming of age in Davos: An analysis of the maturation of Hans Castorp in Thomas Mann's "The Magic Mountain."** *Amer. Imago*, 1961, 18(4), 413-421.—As a child, Hans Castorp had identified with his grandfather, who died, and he had restrained his ability to know his feelings and to respond to people. Now, on the mountain at Davos, "he moves from withdrawal to activity and developing competence, from dependence to independence, and . . . through numerous career choices, intellectual growth, and types of interests to his final choice of career." As he becomes more alive and leaves to join the army, his place in society is once more a compact with death. His childhood trauma again controlled his life to some extent, and German society of early World War I had no real place for Hans Castorp the humanist.—W. A. Varvel.

4008. **Rieff, Philip.** **Freud: The mind of the moralist.** Garden City, N. Y.: Doubleday, 1961. 441 p. \$1.45 (paper).—A paperback edition of the book first published in 1959.—E. Y. Borrowman.

4009. **Sterba, Richard.** (Grosse Pointe, Mich.) **On Sigmund Freud's personality.** *Amer. Imago*, 1961, 18(3), 289-304.—This appreciation of Freud calls attention to his human interest in others, to his deep concern in the welfare of his friends, and his sensitivity to the finest shades of their emotions. Examples are given in letters to Theodor Reik, to Ludwig Binswanger, and to an American mother who had written him in distress about her son.—W. A. Varvel.

4010. **Syz, Hans.** (Lifwynn Found., Westport, Conn.) **A summary note on the work of Trigant Burrow.** *Int. J. soc. Psychiat.*, 1961, 7(4), 283-291.—The following different periods in Burrow's life and activities are reviewed: (a) 1875-1909—youth, medical and psychological studies; (b) 1909-20—training with C. G. Jung in Zurich, psychoanalytic practice, emphasis on social aspects of behavior disorders; (c) 1920-32—development of group- or phylo-analysis, studies of social neurosis, organizing the Lifwynn Foundation for Laboratory Research in Analytic and Social Psychiatry; and (d) 1932-50—intensive group work with increasing emphasis on proprioceptive aspects of man's behavioral health and illness. Burrow was one of the great pioneers in the development of social psychiatric theory and research. (43 ref.)—R. M. Frumkin.

4011. **Walsh, Maurice N.** (Beverly Hills, Calif.) **Some character aspects of the satirist (Pietro Aretino).** *Amer. Imago*, 1961, 18(3), 235-262.—Pietro Aretino was "one of the most remarkable and contradictory personalities in the history of literature." Most of his work tended to "ridicule the great, to clown, to provoke admiration, to render situations and people absurd and ridiculous, and to arouse

amusement at his wit and anger at his insults." His life appeared to consist of little beside the acting out of unconscious impulses. His disturbance was in the nature of a character deformation with marked narcissistic, oral, and oral sadistic features. In his life and works he struggled against deep self-destructive urges and depressive feelings.—W. A. Varvel.

4012. **Ware, J. Garth.** (USN Hosp., Camp Pendleton, Calif.) **Coleridge's great poems reflecting the mother imago.** *Amer. Imago*, 1961, 18(4), 331-352.—In 6 months, Coleridge produced "The Rime of the Ancient Mariner," "Kubla Kahn," and Part 1 of the projected 5 parts of "Christabel." In these poems "one can see emerging with varying degrees of clarity, a fantasy resulting from a fixation on early mother-child or -infant relations." The imagery of "Christabel" is especially shifting and contradictory but responsive to analytic interpretation. This highly productive period ended with his separation from William and Dorothy Wordsworth. "The remainder of his life was dominated by 3 themes: brandy, opium, and endless literary speculation as to what had caused the poetic lightning to hit him once, but never again."—W. A. Varvel.

THEORY & SYSTEMS

4013. **Beritov, I. S.** (Inst. Physiology, Georgian Acad. Sciences, Tbilisi, USSR) **Kharakteristika i proiskhozhdenie proizvol'nykh dvizhenii u vysshikh pozvonochnykh zhivotnykh.** [Characteristics and origin of voluntary movements in higher vertebrates.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 193-201.—Theoretico-experimental discussion on the basis of data obtained in the author's laboratory. By voluntary movements is meant such behavioral acts as are directed by images of vitally important objects in the environment. All the receptors participate in the creation of these images; but their projection into the environment is due to visual, vestibular, and auditory perception.—A. Cuk.

4014. **Čáp, Jan.** **Hlavní zásady marxistické koncepcie psychologického rozboru činnosti.** [The main principles of the Marxist conception of the psychological analysis of activities.] *Acta U. Carolinae, Ser. phil. hist.*, 1961, No. 1, 3-14.—An application of Marxist theory to the understanding of unity of organism and environment. This theory, superior to introspective and behavioristic theories, helps to solve practical problems of production and education.—H. Bruml.

4015. **Cattell, Raymond B.** (U. Illinois) **Group theory, personality and role: A model for experimental researches.** In Frank Geldard (Ed.), *Defence psychology* (See 37: 4053) Pp. 209-259.—28 propositions are presented "defining a set of concepts in group behavior which are mutually consistent and offer a single theoretical model. More than half of these have to do with roles, relating them both to group functioning and personality. The 30 accompanying formulae and equations define the actual calculations to be used in measuring and relating these concepts, as a basis for further experimental research on hypotheses." (48 ref.)—G. H. Mowbray.

4016. **Fraisse, Paul.** **Vers une psychologie complète.** [Toward a complete psychology.] *Psychol. Franc.*, 1962, 7(3), 165-177.—Presidential address at

the 1962 meeting of the Société Française de Psychologie.—C. J. Adkins.

4017. Hofstätter, P. R. *Theoretische Grundlagen der Verhaltenssteuerung*. [Theoretical foundations of behavior control.] *Psychol. Rdsch.*, 1962, 13(3), 163-179.—Methodological considerations necessitate a separation of the conceptual content and the psychophysiological processes of behavior control. The conceptual content is seen as the covariance in an interdependence system with 8 poles: habit, need, constitution, situation, behavior, perception, social values, and learning. A feedback model represents the psychophysiological processes. The importance of anxiety and learning in behavior control is emphasized.—W. J. Koppitz.

4018. Mayer-Gross, W. On biological and psychological time. *Pratibha*, 1959, 2(2), xi-xvii.—Time awareness is influenced by environmental factors like light, chemical factors, temperature, etc. Exact temporal measurement in the animal world is indicated in phenomena like physiological clockwork, bird migration, and "cerebral clock." Cyclic symptoms in mental disorders are found like periodic diseases, persistent sleep disturbances, mood swings, postencephalitic inversions. If "a drug could be developed influencing the diurnal cycle directly, we may come nearer to treating successfully many pathological conditions which at present resist our therapeutic endeavours."—U. Pareek.

4019. Oliver, W. Donald, & Landfield, Alvin W. (U. Missouri) Reflexivity: An unfaced issue of psychology. *J. indiv. Psychol.*, 1962, 18(2), 114-124.—Since the psychologist cannot be divorced from the object of his study, paradoxes of self-reference emerge. To avoid these, he should become aware of their nature and also examine his own activities in the light of "whether anything he is about to expound is inconsistent with the ability to do all these things that he has arrogated to himself."—A. R. Howard.

4020. Rao, S. K. Ramachandra. An essay in psychological axiomatics. *Pratibha*, 1959, 2(1), 20-31.—Some axioms of psychology in the mathematical concepts of set, space, and vector are stated. A set of 3 axioms—inclusion, attribution, and action—are stated in symbolic terms.—U. Pareek.

PHILOSOPHY

4021. Burr, Harold Saxton. *The nature of man and the meaning of existence*. Springfield, Ill.: Charles C Thomas, 1962. 100 p. \$5.50.—A series of essays dealing with: the notion of universe, the biology of man, the evolution of man, man as an organism, man and his nervous system, the sense of well-being, the anatomy of anxiety, the nature of man, and the meaning of existence.—C. H. Miley.

4022. Collier, Rex M. (VA Hosp., St. Louis, Mo.) Independence: An overlooked implication of the open system concept. *J. indiv. Psychol.*, 1962, 18(2), 103-113.—Unifying concepts of the organism aid research and theory building. Toward this end, the assumption is made "that living protoplasm is an open energy system." Thus "it is implied that there are energy transactions between the system and its surroundings. This is one of the more obvious implications. . . . [A] less obvious implication is that the open system of living protoplasm has also some degree of independence from surroundings." A basis

is offered for such concepts as degrees of freedom, individuality, and self.—A. R. Howard.

4023. Govindaswamy, M. V. Surrender—not to self-surrender. *Pratibha*, 1959, 2(2), i-x.—Surrender can be "voluntary, involuntary, active or passive. The surrender can be to an idea, to a cause, to an individual, to a group or to Godhead. . . . Pathology arises when such surrender is either anti-individual or anti-social. . . . Surrender to an ideal or the Godhead is the ultimate goal from surrender—not to self-surrender. The surrender is from the individual to the cosmic and is a problem in the context of ultimate reality. This concept is characteristic of Indian culture."—U. Pareek.

4024. Hawkins, David. (U. Colorado) Design for a mind. *Daedalus*, 1962, 91(3), 560-577.—This is a philosophical myth for the computer age in which Hawkins seeks to specify the properties that the species of thinking machines—*Machina cogitans*—must have to attain consciousness. Hawkins discusses copying units, self-maintenance, intensionality, gattling, and novelty as necessary aspects and processes of such a species.—K. E. Davis.

4025. Hutten, Ernest H. (London, England) An interpretation of the mind-body problem. *Amer. Imago*, 1961, 18(3), 269-277.—Epistemological dualism is the product of an ambivalent fantasy. The official, philosophical attempts at treating the mind-body problem are considered with particular attention to the notions of substance and of cause. "A human response to a stimulus always involves both the inner and the external world, and the two are not cut off from one another; they are in a dynamic equilibrium due to the incessant introjection and projection by which we maintain ourselves."—W. A. Varvel.

4026. Mahrer, A. R. (Denver VA Hosp.) A preface to the mind-body problem. *Psychol. Rec.*, 1962, 12(1), 53-60.—The problem of dualism is seen to emanate from 3 assumptions about the human being: the number of basic events or substances, the nature of these stuffs, and their organization. The author takes a monistic position with reference to the 1st assumption, attributes no intrinsic nature other than a time-space locus, and attempts to gain understanding "by means of abstracting from the human being and his behavior." This latter process yields constructs which are descriptive of (i.e., labels for) but not part of the behavioral event. Component analyses of the human (e.g., reductionism) are rejected. From this position the issue of dualism "is a pseudoproblem, unanswerable because it is irrelevant."—R. J. Siedel.

4027. McGill, V. J. (Inst. Philosophical Research) On establishing necessary human abilities and disabilities. *Phil. Sci.*, 1962, 29(4), 393-405.—Claims of certain recent philosophers (e.g., Hampshire, Husserl) purportedly establishing universal human abilities and disabilities on logical grounds are rejected. The proper ranges of acts such as believing and intending are matters to be determined by inductive method rather than by logical analysis.—M. Turner.

4028. Murthy, A. Krishna. A comparative study of the conception of the ego and its dissolution. *Pratibha*, 1959, 2(2), 86-90.—The concepts of ego in the various schools of Indian philosophy—Carvak, Samkhya, Jaina, Buddhist, Nyaya-Vaiseska, Mimam-

sakas, Advaita Vedanta, Visistadvaitism, Dvaitinism—are mentioned. "The various philosophical schools agree on an essential attitude, namely, the characterization of an individual ego as bound or fettered. This is an unnatural state, a deviation from an original equilibrium, an unsteady emergence. What is termed emancipation in the philosophical language is merely the restoration of the original condition. Thus the problem of the emergence of the ego for an Indian thinker is intimately associated with that of the dissolution of the ego."—U. Pareek.

4029. Rothstein, J. (Boston, Mass.) **Discussion: Information and organization as the language of the operational viewpoint.** *Phil. Sci.*, 1962, 29(4), 406-411.—It is suggested that the operational viewpoint can be formalized within the framework of information theory. Measurement constitutes the informational input; laws and theory (in the case of mechanics), a noiseless communication channel; and prediction the output. However, as "a general methodology . . . empirical operationism . . . should be noncommittal with regard to specific laws and assumptions."—M. Turner.

4030. Ruitenbeek, Hendrik M. (Ed.) **Psychoanalysis and existential philosophy.** New York: Dutton, 1962. xxvi, 262 p. \$1.75 (paper).—A collection of essays that gives a broad and varied view of existential psychoanalysis as it is today. The contributors are Ruitenbeek, Paul Tillich, Ludwig Binswanger, W. Van Dusen, R. D. Laing, Thomas Hora, Medard Boss, J. H. Van Den Berg, F. J. J. Buytendijk, Rollo May, and Eugen Kahn.—C. A. Curran.

4031. Sen, Indra. **The objectless or self-existent joy in Indian philosophy.** *Pratibha*, 1959, 2(1), 5-7.—"The fact of self-existent joy is of tremendous consequence to the psychology of emotions, which has baffled psychological investigation so far . . . It may be a most potent unifying force in personality. Self-existent joy is the key note in Indian philosophy."—U. Pareek.

STATISTICS

4032. Gibson, W. A. (Army Personnel Research Office) **Orthogonal predictors: A possible resolution of the Hoffman-Ward controversy.** *Psychol. Rep.*, 1962, 11(1), 32-34.—"Two different definitions of the independent contribution of a single predictor toward multiple rectilinear prediction merge into one in the case of mutually uncorrelated or orthogonal predictors. This note provides the theory for converting a set of correlated predictors into a maximally corresponding orthogonal set whose two kinds of independent contribution are identical."—B. J. House.

4033. Smith, G. Milton. (City U. New York) **A simplified guide to statistics for psychology and education.** (3rd ed.) New York: Holt, Rinehart & Winston, 1962. xix, 164 p. \$1.75 (paper).—The more commonly used statistical tools and concepts are assembled and illustrated in this paperbound handbook. This new edition differs from earlier versions in that it contains methods for calculating means and variances, and correlation and regression coefficients. 6 new tables have been added. "Though this Guide is primarily intended as a means of clarifying and supplementing the material in general and laboratory courses . . . it may now serve as a short text for a one-semester course in statistics; for it contains

most of the 'minimum essentials' of such a course."—R. Perloff.

Experimental Design

4034. Lasky, Julian J. (VA Hosp., Perry Point, Md.) **The problem of sample attrition in controlled treatment trials.** *J. nerv. ment. Dis.*, 1962, 135(4), 332-337.—"It is virtually impossible to prevent sample attrition during the course of a controlled treatment evaluation study conducted in a hospital. Possible consequences of treatment-related and non-treatment-related dropouts on results have been briefly presented and six approaches or partial solutions to the sample attrition problem have been discussed. Sample attrition can be kept to a minimum through the use of well designed experiments based on adequate information regarding the major components of the experiment; subjects, treatments, setting and criterion measures."—N. H. Pronko.

4035. Rawson, Harve E., & Rettig, Salomon. (Ohio State U.) **Controlling the effects of "clouding variables" in multivariate research designs.** *Educ. psychol. Measmt.*, 1962, 22(3), 493-500.—"A method of semi-partial multiple correlation is presented which enables the investigator to test the effects of any number of 'clouding variables' upon the independent and dependent variables. This method takes into account all interaction terms. The amounts of criterion variance which are explained by the predictors alone, by the clouding variables alone, and by the predictors and the clouding variables, can be ascertained in a simple, meaningful fashion with a minimum of computational drudgery." The use of the procedure is illustrated with a sample of 20 students. The criterion was a score of overestimation of knowledge and the predictors were moral value judgment factor scores. The clouding variables were 6 measures of student socioeconomic status.—W. Coleman.

4036. Rosenthal, Robert, & Halas, Edward S. (U. North Dakota) **Experimenter effect in the study of invertebrate behavior.** *Psychol. Rep.*, 1962, 11(1), 251-256.—"A total of 8 Es participated in two studies of invertebrate behavior. In both experiments there were significant E effects on the performance of the invertebrate Ss [planaria]. In one of the experiments, there were significant E effects on Ss' performance changes. Factors accounting for significant E effects in studies of invertebrate behavior have yet to be demonstrated. In view of the findings presented, a Treatments-by-Es design was suggested as useful in this area of research."—B. J. House.

Formulas & Calculations

4037. Durup, H. **Etude critique des conditions d'utilisation du coefficient de corrélation "point-tetrachorique" et du rapport ϕ/ϕ_{\max} .** [Critical study on the conditions using coefficient of correlation "point-tetrachoric" and ratio ϕ/ϕ_{\max} .] *Bull. Cent. Etud. Tech. Psychotech.*, 1961, 10(4), 419-431.—"One is often tempted to use the fourfold point correlation coefficient (ϕ) in cases where dichotomies are only apparently natural and should be treated with the tetrachoric coefficient r_t . We recall the means and the extent to which both cases may be discriminated from each other. The ratio ϕ/ϕ_{\max} only makes sense in cases where the marginal dis-

tributions are really prior to the relation considered. The comparisons aimed at proving that ϕ has a more limited extension than r_t or r do not appear justified to us. When a marginal distribution is undetermined (control sample—experimental sample) rather than deciding arbitrarily 50% against 50% it would be more advisable, for theoretical as well as practical reasons to use the ϕ coefficient, the determination of which depends on partial distributions of both subpopulations."—*V. Sanua*.

4038. Gerjuoy, Herbert (U. Toledo) Spearman's rho and Kendall's tau compared with respect to descriptive information. *Psychol. Rep.*, 1962, 10, 879-884.—" ρ and τ are both measures of rank association. Given a sample of n pairs, the number of possible values of ρ and τ is determined. The number of possible values is greater for ρ than for τ , approximately as n^3 is greater than n^2 . Assuming equiprobability of all possible sets of ranked scores, an assumption usually made when testing the significance of ρ or τ , the descriptive information (Shannon's measure of information applied to the probability distribution of the statistics) in ρ and τ is computed for selected small values of n . It is shown that ρ has more descriptive information than τ ."—*B. J. House*.

4039. Jaspén, Nathan. (New York U.) IBM 650 rectangular correlation matrix program for incomplete cases. *Educ. psychol. Measmt.*, 1962, 22(3), 607-611.—This special correlation program has these features: ease of operation, handles incomplete cases, produces either a rectangular or a square correlation matrix, yields 4 outputs, conserves drum storage, and calculates to high arithmetic precision.—*W. Coleman*.

4040. Jaspén, Nathan. (New York U.) Methods of computing correlation matrices on the IBM 1620. *Educ. psychol. Measmt.*, 1962, 22(3), 587-593.—The following methods are suggested: address modification, single row product, the matrix product method, and a program generating method. Additional methods are needed to handle very large matrices and to handle incomplete cases.—*W. Coleman*.

4041. Jaspén, Nathan. (New York U.) Self-scoring item analysis procedure for the IBM 1620. *Educ. psychol. Measmt.*, 1962, 22(3), 595-598.—A single-pass item analysis program is described with the steps to be followed. A point biserial may be computed with this program. Some operating times and costs are cited.—*W. Coleman*.

4042. Levonian, Edward, & Azen Stanley (U. California, Los Angeles) A fortran program for proportion of variance in multiple regression. *Educ. psychol. Measmt.*, 1962, 22(3), 599-601.—This program computes "the proportion of variance in the dependent variable accounted for by m independent variables in a problem for which the inverse matrix of correlations between the independent variables is available."—*W. Coleman*.

4043. Levonian, Edward, & Gregory, Raymond. (U. California, Los Angeles) A fortran program for multiple regression scores. *Educ. psychol. Measmt.*, 1962, 22(3), 603-605.—To compute a given S 's score for a dependent variable, a multiple regression equation may be used. "The procedure involves multiplying the regression coefficient associated with a

given independent variable by the subject's score on that variable, summing these products, then adding a constant."—*W. Coleman*.

4044. Lord, Frederic M. (Educational Testing Service) Test reliability: A correction. *Educ. psychol. Measmt.*, 1962, 22(3), 511-512.—Although Var_{τ} is identical to the squared standard error of measurement ($S.E.^2_{meas.}$) as computed from the Kuder-Richardson Formula 21 (K-R 21), this does not justify the use of K-R 21 as a reliability coefficient in those situations where all examinees take the same test. Depending on which errors of measurement are to be considered, different reliability coefficients may be formulated.—*W. Coleman*.

4045. Lubin, A. (Walter Reed Army Inst. Research, Washington, D. C.) L'utilisation des correlations par rang pour éprouver une tendance dans un ensemble de moyennes. [The use of rank-order correlations to test the trend in a set of means.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(4), 433-444.—"When the same subjects have been measured several times, any test for trend in the means must take into account the correlations between the observations. Jonckheere has proposed the P test, based on the average value of Kendall's tau. This paper extends Lyerly's study of the average value of Spearman's rho to a J test homologous to Jonckheere's P. In some cases, J can be shown to be more sensitive to P."—*V. Sanua*.

4046. Toigo, Romolo. (Rip Van Winkle Found.) An IBM 650 computer program for the evaluation of a reciprocation index utilizing classroom data based upon unlimited choices obtained under a single sociometric criterion. *Educ. psychol. Measmt.*, 1962, 22(3), 613-615.—Use of the program is illustrated and a brief description of the program is provided.—*W. Coleman*.

Factor Analysis

4047. Comrey, Andrew L. (U. California, Los Angeles) The minimum residual method of factor analysis. *Psychol. Rep.*, 1962, 11(1), 15-18.—"An iterative method of factor analysis is presented which requires no communality estimates. The sum of squares of the off-diagonal residuals is minimized at each step. Computation time exceeds that for the centroid method but is less than that for the principal factor methods."—*B. J. House*.

4048. Howard, Kenneth I., & Cartwright, Desmond S. (U. Chicago) An empirical note on the communality problem in factor analysis. *Psychol. Rep.*, 1962, 10, 797-798.—"A correlation matrix of 47 personality and ability measures, which were obtained on 439 Ss, was factor analyzed using the principal-axis method. Three different communality estimates were used: (a) unity, (b) the communalities resulting from the factor analysis of (a), and (c) squared multiple correlations (SMC). In each case 17 factors were extracted. Inspection of the intercorrelations between the three factor solutions indicated that they were almost identical. The three rotated solutions showed even more similarity. An analysis of the communality estimates indicated that SMCs were the most stable and that other estimates tended to converge on the SMCs."—*B. J. House*.

4049. Overall, John E. (Kansas State U.) Orthogonal factors and uncorrelated factor scores.

Psychol. Rep., 1962, 10, 651-662.—"A general algebraic model for linear components analysis is presented. Although the emphasis in linear components analysis is somewhat different from the emphasis in most treatments of factor analysis, the linear components model yields results which are identical to those resulting from various methods of factor analysis. It is demonstrated that truly orthogonal linear components can be obtained when the matrix which is factored has unity in the principal diagonal. The use of communalities in the principal diagonal cannot in general be expected to yield orthogonal linear components. Empirical examples of various special applications of the general model are presented."—*B. J. House.*

4050. Venkatramiah, S. R. A note on resolving the Heywood case in multiple factor analysis. *Pratibha*, 1959, 2(1), 121-123.—A method is suggested to resolve the mystery.—*U. Pareek.*

4051. Werdelin, I. (U. Lund, Sweden) Synthesis of factor analyses: I. The theoretical background. *Scand. J. Psychol.*, 1962, 3(3), 143-154.—When performing a series of factor analyses, we must be able to compare the different solutions. From a discussion of mathematical invariance theory, a number of assumptions are deduced, which are necessary when we perform a series of analyses with entirely or partly the same tests but different samples of Ss. From these assumptions we obtain a method of rotating the factors of a certain study to a pattern determined by the factors of another study.—*Journal abstract.*

4052. Werdelin, I. (U. Lund, Sweden) Synthesis of factor analysis: II. Application of the method on an example. *Scand. J. Psychol.*, 1962, 3(3), 155-164.—In a previous article (see 37: 4051) a new method of rotating the factors of a certain study to a pattern determined by the factors of another study is presented. Here the method is applied to an example, and it is found that it yields results which are essential to our interpretation of certain factors and to our understanding of the field.—*Journal abstract.*

GENERAL BOOKS & REFERENCE WORKS

4053. Geldard, Frank (Ed.) (U. Virginia) *Defence psychology*. London, England: Pergamon, 1962. (NATO Conference Ser. No. 1) vii, 354 p. \$10.00.—The proceedings of a symposium sponsored by the North Atlantic Treaty Organization Advisory Group on Defence Psychology held in Paris in 1960. There are 23 papers (16 in English and 7 in French) and resumes of discussions that took place. 3 main areas of interest were explored: the identification and assessment of human abilities, training and military education, and group productivity (see 37: 4015, 4147, 4432, 4841, 4891, 5016, 5706, 5708, 5711, 5713, 5721, 5726, 5735, 5741, 5745, 5748, 5750, 5753, 5760, 5785, 5788, 5790). Also included is an invited address by D. E. Broadbent entitled "Common Principles in Perception, Reaction, and Intellectual Decision" (see 37: 5796).—*G. H. Mowbray.*

4054. Havemann, Ernest. *The age of psychology*. (New York: Grove, 1962. 115 p. \$50 (paper).—A paperback edition of a book originally published in 1957.—*C. T. Morgan.*

4055. James, William. *Psychology: The briefer course*. New York: Harper, 1961. xi, 343 p. \$1.85.—A paperback edition of a book originally published in 1892. This edition has an 11-page introduction by G. W. Allport.—*C. T. Morgan.*

4056. McGuigan, F. J., & Calvin, Allen D. (Holtins Coll.) *Current studies in psychology*. New York: Appleton-Century-Crofts, 1958. 225 p. \$2.65.—A collection of current (since 1950) scientific studies selected from the areas of learning; motivation; developmental, personality, and behavior disorders; perception; and social psychology. The studies all come from the area of pure rather than applied research and are presented in journal style. A general introduction covers all of the studies, and an appendix relates the studies to 8 different elementary psychology texts.—*W. L. Faust.*

4057. Sartain, A. Q., North, A. J., Strange, J. R., & Chapman, H. M. (Southern Methodist U.) *Psychology: Understanding human behavior*. (2nd ed.) New York: McGraw-Hill, 1962. xi, 432. \$6.95.—Intended as a 1-semester introductory text which emphasizes the understanding of human behavior, this revision (see 32: 3467) includes considerably more material on learning and the mechanisms of heredity. The 19 chapters cover the standard topics of most basic texts. Each chapter includes a summary, extensive review questions, and suggested readings. Glossary of terms is provided. A study guide is available.—*D. T. Kenny.*

4058. United States Army Medical Research Laboratory. *Publications of US Army Medical Research Laboratory, Fort Knox, Kentucky. Vol. 2. Abstracts of Reports 400-540*. Fort Knox, Ky.: USA MRL, 1962. 141 p.

4059. Yates, Aubrey J. *Frustration and conflict*. New York: Wiley, 1962. x, 236 p. \$5.00.—The literature is reviewed and integrated. The experimental studies of Maier on frustration and fixation are analyzed in detail; so also are the studies of N. E. Miller and others on frustration, conflict, and aggression, and those of Lewin and his colleagues on frustration and regression. A final chapter relates the studies of frustration and conflict to each other within the framework of modern learning theory.—*C. T. Morgan.*

ORGANIZATIONS

4060. Alluisi, Earl A. (Human Factors Research Lab., Lockheed-Georgia Co.) *Proceedings of the fifty-fourth Annual Meeting of the Southern Society for Philosophy and Psychology. Amer. Psychologist*, 1962, 17(9), 618-620.—Approximately 200 attended the meeting held on April 19-21, 1962 in Memphis, Tennessee. "The program included 19 papers and 2 symposia in philosophy, 34 papers and 3 symposia in psychology, and 2 joint sessions." The program of papers and their authors is listed.—*S. J. Lachman.*

4061. American Psychological Association. *Announcement of the XVIIth International Congress of Psychology: Washington, D. C., 20-26 August 1963. Amer. Psychologist*, 1962, 17(9), 655-656.—About 120 foreign psychologists "and an approximately equal number of their American and Canadian colleagues will be invited by the Program Committee to participate in the program of the Con-

gress." There will also be a few sessions of submitted papers. Major program topics are indicated. The working languages of the Congress will be English and French. American Psychological Association committees for this event are listed.—S. J. Lachman.

4062. American Psychological Association. Program of the seventieth Annual Convention of the American Psychological Association: August 30-September 5, 1962, St. Louis, Missouri. *Amer. Psychologist*, 1962, 17(6), 295-422.—Abstracts of papers and symposium announcements are presented; business meetings, presidential addresses, and social functions are announced. Indices of sponsored programs and of participants are provided.—S. J. Lachman.

4063. Arnoult, Malcolm D. (Texas Christian U.) Proceedings of the ninth Annual Meeting of the Southwestern Psychological Association. *Amer. Psychologist*, 1962, 17(9), 611.—325 persons attended the meeting held at Fort Worth, Texas, April 5-7, 1962. The program included 14 research paper sessions, 7 symposia, 4 workshops, and 2 invited addresses.—S. J. Lachman.

4064. Boring, Edwin G. (Harvard U.) The 1962 meeting of the American Philosophical Society. *Amer. J. Psychol.*, 1962, 75(2), 327-328.—At the April 1962 meeting held in Philadelphia the 4th Karl Spencer Lashley Award was made to Philip Bard of Johns Hopkins University.—R. D. Nance.

4065. Boring, Edwin G. (Harvard U.) The 1962 meeting of the National Academy of Sciences. *Amer. J. Psychol.*, 1962, 75(2), 326-327.—The 99th annual meeting was held at the Academy building in Washington, D. C. on April 23-26, 1962. 13 of the 23 members of the Section of Psychology were present. The Daniel Giraud Elliot Medal was presented to Donald R. Griffin of Harvard University for his work on echolocation of bats.—R. D. Nance.

4066. Bray, Charles W. (Smithsonian Inst.) Toward a technology of human behavior for defense use. *Amer. Psychologist*, 1962, 17(8), 527-541.—Conditions faced by defense managers are changing rapidly. "The significant changes for behavioral scientists are the expansions of the military environment into a world of machines and into new social settings. . . . Defense management needs a technology of human behavior based on advances in psychology and the social sciences." 6 programs warranting special attention are separately discussed: human performance, man-machine systems, decision processes in the individual, team functions, adaptation of complex organizations to changing demands, and persuasion and motivation.—S. J. Lachman.

4067. Darley, John G., & Meredith P. Crawford. (American Psychological Ass.) Growth and allocation of resources within the APA. *Amer. Psychologist*, 1962, 17(7), 465-474.—"As an organization of individual members, our first major source of income derives from membership dues." Major sections are: Growth in Income, Expense, and Membership; History of Dues Increases; The Journal Operations; Annual Allocation of Resources; External Grants and Contracts; Additional Operations; and Conclusion. "Just as 1962 represented our first budgeted years of over \$1,000,000 in both income and

expenses, 1963 will see a membership in excess of 20,000."—S. J. Lachman.

4068. Dreger, Ralph Mason. (Jacksonville U.) Proceedings of the eighth Annual Meeting of the Southeastern Psychological Association. *Amer. Psychologist*, 1962, 17(9), 612-617.—Approximately 430 registered at the meeting which was held in Louisville, Kentucky on March 29-31, 1962. "The program consisted of 10 symposia, 78 papers, 1 invited address, and 2 presidential addresses. . . . 1 special report, and 4 special meetings."—S. J. Lachman.

4069. Grice, G. Robert. (U. Illinois) Proceedings of the thirty-fourth Annual Meeting of the Midwestern Psychological Association. *Amer. Psychologist*, 1962, 17(9), 607.—1716 persons registered at this meeting held in Chicago on May 3-5, 1962. "The program consisted of 180 papers, six symposia, and a Psi Chi meeting. I. E. Farber delivered the Presidential Address entitled 'The Things People Say to Themselves.'"—S. J. Lachman.

4070. Harrell, Thomas W. (Stanford U.) Proceedings of the forty-second Annual Meeting of the Western Psychological Association. *Amer. Psychologist*, 1962, 17(9), 597-606.—Approximately 1600 persons registered at the meeting held at San Francisco on April 19-21, 1962. "The program included 185 papers, 5 films, 19 symposia, 3 invited addresses, and the Western Psychological Invitation Addresses by Anatol Rapoport on 'The Prisoner's Dilemma' and B. F. Skinner on 'The Future of Teaching Machines.'" The program of papers and their authors is listed.—S. J. Lachman.

4071. Iverson, Marvin A. (Adelphi Coll.) Proceedings of the thirty-third Annual Meeting of the Eastern Psychological Association. *Amer. Psychologist*, 1962, 17(9), 608-610.—2008 registered at the meeting which was held April 26-28, 1962, in Atlantic City, New Jersey. Summary statements concerning the program and an outline of major items transacted at the Annual Business Session and the Board of Directors Meeting are presented.—S. J. Lachman.

4072. Iverson, Marvin A. (Garden City, N. Y.) Thirty-third Annual Meeting of the Eastern Psychological Association. *Amer. J. Psychol.*, 1962, 75(3), 504-505.—The association met April 26-28, 1962 at the Chalfonte-Haddon Hall in Atlantic City, New Jersey. The 1963 meeting will be held at the Statler-Hilton Hotel in New York City, April 11-13.—R. D. Nance.

4073. Kennedy, John L. (Princeton U.) Fifty-eighth Annual Meeting of the Society of Experimental Psychologists. *Amer. J. Psychol.*, 1962, 75(2), 328.—The meeting was held at the University of Michigan on April 20 and 21, 1962. Members presented reports of research in progress. The Warren Medal for 1962 was awarded to James Olds. The society accepted the invitation of Brown University to meet in Providence in 1963.—R. D. Nance.

4074. Langhorne, M. C. (Trinity Coll.) Proceedings of the first Annual Meeting of the New England Psychological Association. *Amer. Psychol.*, 1962, 17(9), 621-622.—The organizational meeting of the proposed New England Psychological Association was held on the campus of Brandeis Uni-

versity, Waltham, Massachusetts, October 20-21, 1961. The program of papers and participants is presented.—*S. J. Lachman.*

4075. Miller, Wilbur C. (U. Denver) **Thirty-second Annual Meeting of the Rocky Mountain Psychological Association.** *Amer. J. Psychol.*, 1962, 75(3), 505-506.—The meeting was held at the Finlen Hotel in Butte, Montana, on May 10-12, 1962. The 1963 meeting will be held in Cody, Wyoming.—*R. D. Nance.*

4076. Sanua, Victor D. (Yeshiva U.) **Seventh Congress of the Interamerican Society of Psychology.** *Amer. J. Psychol.*, 1962, 75(2), 328-329.—The congress was held in Mexico City from December 19 to 23, 1961. Approximately 650 members and visitors from 11 countries attended. 95 papers were presented. The 8th congress is scheduled for April 2 to 6, 1963, and is to be held at Mar Plata, Argentina.—*R. D. Nance.*

PROFESSIONAL PROBLEMS

4077. Cohen, J. (U. Manchester) **Reflections on the resolution of conflict in international affairs.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 59-77.—A warning against attempting to psychologize world conflict. Role reversal and international conferences are suggested as ways of understanding others' views.—*B. T. Jensen.*

4078. Crane, William J. (Eastern Illinois U.) **Screening devices for occupational therapy majors.** *Amer. J. occup Ther.*, 1962, 16(3), 131-132.—A large battery of tests were correlated with the criterion of grade-point averages of occupational therapy students at graduation or at the time of leaving the program at Eastern Michigan University. The aim was to distinguish between those who passed or failed in the program. It was found that some 7 tests had high correlations with the criterion and that the Edwards Personal Preference Schedule and Iowa Silent Reading Test combined with the Watson-Glaser Critical Thinking Appraisal were the best combination of predictors.—*M. A. Seidenfeld.*

4079. Hahn, Milton E. (U. California, Los Angeles) **Forgotten people: The normal individual and, in, professional psychology.** *Amer. Psychologist*, 1962, 17(11), 700-705.—Among our badly forgotten men and women are those women who have completed the career of wife and mother, men and women who resign from the military in their forties or early fifties, and men and women who successfully play career roles but now are caught in a professional trap. Psychological practitioners can make a contribution to "normal, mature, self-actualizing people between the ages of 30 and senescence."—*S. J. Lachman.*

4080. Hoch, E. L., & Darley, John G. (American Psychological Ass.) **A case at law.** *Amer. Psychologist*, 1962, 17(9), 623-654.—In a Washington, D. C., trial, the jury was instructed by the judge to disregard evidence presented by psychologists "to the effect that the defendant was suffering from a mental disease or a mental defect." After the defendant was found guilty an appeal was filed and the United States Court of Appeals handed down a 2-to-1

decision reversing the decision of the lower court. In a hearing before the full 9-man Court of Appeals requested by the Government, both the American Psychological Association and the American Psychiatric Association filed briefs. These briefs are presented in their entirety. "The final written opinion in the case was handed down June 7, 1962. It sustains, by a 7-2 vote, the acceptability of testimony by properly qualified psychologists in cases involving the determination and meaning of mental disease or defect as productive of criminal acts."—*S. J. Lachman.*

4081. Kahn, Theodore C. (USAF Hosp., Lackland AFB, Texas) **Evaluation of United States of America psychology by the "four-years-absent" method.** *Amer. Psychologist*, 1962, 17(10), 706-708.—Criticisms are leveled at psychology in the United States: (a) psychology, both as a discipline and as a profession is vague; (b) psychology lacks goals; (c) psychology is fragmented—the specialties are isolated from each other with little effective intercommunication; (d) psychology appears to be angry—the profession lacks harmony; (e) psychology is insecure—we have a status problem; (f) psychologists suffer from inbreeding—their views are often narrow; (g) psychology lacks tradition; (h) psychology has no modern heroes; and (i) psychologists have surrendered—not only do we lack a concept of self, but "we do not seem to seek one within the framework of our profession." Remedies are suggested.—*S. J. Lachman.*

4082. Lehman, H. (Ohio U.) **The creative production rates of present versus past generations of scientists.** *J. Gerontol.*, 1962, 17, 409-417.—Histories of several fields of research were analyzed for age curves with respect to production rates. "... past and present generation scientists have produced more than their proportionate share of high-quality research not later than at ages 30 to 39."—*J. Botwinick.*

4083. Leipold, William D., & James, Robert L. (U. North Dakota) **Characteristics of shows and no-shows in a psychological experiment.** *Psychol. Rep.*, 1962, 11(1), 171-174.—"Thirty-nine Ss (36% of Ss randomly assigned to an experiment) failed to show for a psychological study conducted at the University of North Dakota. ... It was found that male no-shows were more anxious and tended to have less need for social approval. ... Female no-shows were found to have lower earned grade-point averages than shows with no differences between males. The implications of these results were discussed in terms of the biasing effect upon a sample which was originally selected on a random basis."—*B. J. House.*

4084. Levy, Leon H. (Indiana U.) **The skew in clinical psychology.** *Amer. Psychologist*, 1962, 17(5), 244-249.—"The group studied is the 781 psychologists whose dissertations were listed by Rabin ... in his *A Bibliography of Doctoral Dissertations in Clinical Psychology*. ... The entire group produced a total of 2,922 publications during the period studied, with a mean of 3.7 and a median of 1.6. The distribution was extremely skewed with 28.9% of the group having no publications to their credit and another 19.2% having only one publication; 10% of the group accounted for 45% of their output. ... In the language of the day, the particular mixture of

fact and fantasy which we have here appears to be a highly fissionable one . . ."—*S. J. Lachman*.

4085. Mercer, B. E., & Pearson, J. B. (U. Colorado) **The ethics of academic status-striving.** *Sociol. soc. Res.*, 1962, 47(1), 51-56.—There is an academic folklore that status-striving behavior of a sort which interferes with the legitimate functions of higher education exists among some faculty members. A questionnaire study of the attitudes of 423 academic sociologists toward a list of 8 status-striving activities resulted in an "ethicality scale score" for each respondent. The relationship of the score to a number of personal and institutional attributes of the respondent was then subject to chi-square analysis. In general, the respondents indicate a high incidence of status-striving activities on their campuses, and they tend to view such behavior as violations of their personal and professional ethics.—*Journal abstract*.

4086. Murphy, Gardner. (Menninger Found.) **Four conceptions of research in clinical psychology.** *Bull. Menninger Clin.*, 1961, 25(6), 290-295.—Research in clinical psychology has various aims: to enlarge the system of psychology as a science, to draw immediately useful applications, and to broaden and deepen our understandings within a given frame of reference. There is also "the derivation of new meanings . . . from facts which were never sought for or conceptualized but which drop . . . unexpectedly . . . [and become] a pivot on which we swing to a new level of insight."—*W. A. Varvel*.

4087. Murray, H. A. (Harvard U.) **Prospect for psychology.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 11-32.—Utilizing a fictitious trial setting, Socrates and Aristotle and some "angels" deal with the question as to whether or not psychologists are concerned with irrelevancies while they could be solving formidable problems.—*B. T. Jensen*.

4088. Smith, Ewart E. (Los Angeles Division, Matrix Corp.) **Obtaining subjects for research.** *Amer. Psychologist*, 1962, 17(8), 577-578.—5 sources of Ss which have produced ample data include: (a) United States Employment Service, (b) military reserve units, (c) operational military units, (d) prisons, (e) fire departments. "The research subject problem can be solved by obtaining the help of organizations other than universities. . . . The cooperation of these organizations can best be obtained by establishing a rapport based on an understanding of their needs."—*S. J. Lachman*.

4089. Williamson, E. G. (U. Minnesota) **The counselor as technique.** *Personnel Guid. J.*, 1962, 41(2), 108-111.—The thesis is presented that counselors are in the "influence business" and therefore must struggle with ethical problems, searching for models of character development both for themselves and for their counselees. Desirable characteristics for the counselor to have are suggested.—*S. Kavruck*.

Psychological Personnel

4090. Harper, Roland. (U. Leeds, England) **The psychologists' role in food-acceptance research.** *Food Technol.*, 1962, 16, 70-73.—Ways in which

psychological knowledge has contributed, or potentially could contribute, to food sciences are reviewed. Heretofore main emphasis has been on analysis of sensory qualities in relation to physical properties of foods and on measurements of "hedonic tone"; however, investigation of the sociopsychological aspects of food acceptance would be equally relevant.—*D. R. Peryam*.

4091. Kazmier, Leonard J. **The psychologist as a behavioral scientist in the business school.** *Amer. Psychologist*, 1962, 17(5), 253-254.—There is now a need for entering faculty personnel in business schools "to apply the behavioral science point of view as integrated members of the business faculty, rather than as distinguished visitors from the psychology department." Recent studies critical of business curricula have stressed the importance of the behavioral sciences in the business school curriculum. The "educational and research experiences leading to the doctorate in industrial psychology" gives the industrial psychologist the opportunity to "fill the role of behavioral scientist in the business school."—*S. J. Lachman*.

4092. Krim, Murray. (NYC) **Psychologists and public information.** *Amer. Psychologist*, 1962, 17(10), 712-714.—The 1st peace group, inspired by Otto Klineberg and organized by Stanley Zuckerman in 1961, now called the "Social Scientists for Peace," had as its purpose the application of psychological knowledge to such urgent issues as war hysteria, cessations of nuclear tests, disarmament, and fall-out shelters. Activities of various groups of psychologists concerning such social endeavors are cited. 2 questions, "Should psychologists participate in demonstrations and similar activities?" and "Should psychologists be doing research rather than engaging in social action and public education?" are discussed.—*S. J. Lachman*.

4093. Rasmussen, E. T. (U. Copenhagen) **How can psychologists assist groups in conflict?** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 33-47.—An intermediary committee between nations is proposed to help them understand their interests as illusions. Difficulties such a committee would have and ways of meeting them are described.—*B. T. Jensen*.

4094. Ross, Sherman. (American Psychological Ass.) **The APA international scientist and visiting scientist programs: 1961-62.** *Amer. Psychologist*, 1962, 17(5), 255-258.—The International Scientist Program involves a small number of first rank scientists and their visits to a limited number of American universities. The Program of Visiting Scientists continued for the 2nd year (in 1961-62); visits were arranged to each of the 96 institutions applying. A table listing the colleges and their respective visitors is provided.—*S. J. Lachman*.

4095. Russell, R. W. (Indiana U.) **Can psychologists contribute?** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 48-58.—This article discusses the psychologist as a citizen and as a psychologist and illustrates ways in which he can contribute in each role.—*B. T. Jensen*.

Training in Psychology

4096. Baker, Frank B. (U. Wisconsin) **A computer course for the behavioral scientist.** *Educ. psychol. Measmt.*, 1962, 22(3), 617-621.—"The objectives of the course are to provide the student with a working knowledge of: (a) the specialized terminology used by computer specialists; (b) standard statistical library routines; (c) the characteristics of programming; and (d) the role of computers in research." A listing of the major topics is given with some amplification of the details and rationale for each section of the course.—*W. Coleman.*
4097. Bloch, C. **L'enseignement de groupe, méthode de formation à la psychologie pratique.** [Teaching in a group, training in practical psychology.] *Acta neurol. psychiat. Belg.*, 1962, 63, 279-291.—The author reports on his experience at the Tavistock Clinic in connection with the training of case-work and psychotherapy under the direction of M. Balint.—*V. Sanua.*
4098. Costin, Frank, & Kerr, William D. (U. Illinois) **The effect of an abnormal psychology course on students' attitudes toward mental illness.** *J. educ. Psychol.*, 1962, 53(5), 214-218.—The Opinions about Mental Illness Scale was administered at the beginning and end of the semester to an abnormal psychology class (38 men, 32 women) and to a control class of sociology students (60 men, 67 women). 5 attitudes were measured: Authoritarianism, Unsophisticated Benevolence, Mental Hygiene Ideology, Social Restrictiveness, and Interpersonal Etiology. Analysis of covariance revealed that changes which could be attributed to the psychology course were as follows: (a) women became less authoritarian, (b) men achieving in the upper 50% of the class became less authoritarian and less restrictive than lower achieving men, and (c) men and women decreased their attitude of unsophisticated benevolence and increased their conviction that unhealthy interpersonal relations early in life frequently lead to mental illness.—*Journal abstract.*
4099. De Rivera, Joseph. (Dartmouth Coll.) **Teaching a course in the psychology of international relations.** *Amer. Psychologist*, 1962, 17(10), 695-699.—There are several reasons for teaching psychology courses in international relations: (a) psychology has something new to add to the numerous courses in international relations now being taught. (b) There is now enough significant material to make a full semester course worthwhile. (c) Teaching about war and peace can lead to some interesting research. Major sections are: Psychological Approach to International Relations, Course Material, Research Potential, Organizing Course, and Student Research. The author reports his experiences in teaching this kind of course.—*S. J. Lachman.*
4100. Harlow, Harry F., Miller, James G., & Newcomb, Theodore M. (U. Wisconsin) **Identifying creative talent in psychology.** *Amer. Psychologist*, 1962, 17(10), 679-683.—The "Creative Talents Awards program was initiated by the American Institute for Research." Its purpose "is to identify and encourage original and creative research efforts among young psychologists through awards based on appraisals of the qualities shown in the preparation of doctoral dissertations." Panel judges (eminent psychologists), indicated that their hardest problem was the formulation of suitable criteria; each dissertation abstract and the dissertations themselves were evaluated on 4 9-point scales. "Louis M. Herman was the top award winner of \$1,000." 2 awards of \$500 each were made to Sheldon Lee Freud and to James C. Lingoes. 9 persons selected for honorable mention are named.—*S. J. Lachman.*
4101. Hoffman, Howard S. (Pennsylvania State U.) **The analogue lab: A new kind of teaching device.** *Amer. Psychologist*, 1962, 17(10), 684-694.—"This paper describes an inexpensive device which can be used to supplement the training of students in the methods of the behavioral scientist. In essence, the device duplicates for the student many of the problems he would face if given access to a well-equipped laboratory for the study of the conditioned response. It does so by generating data which duplicate, in many respects, that which has or could be derived from experiments with living organisms. The major portion of this paper is concerned with illustrating the range and variety of research experience which the device makes available to the student." A list of components for the analogue lab are presented.—*S. J. Lachman.*
4102. Johnson, Paul E. (Boston U.) **Clinical pastoral training at the crossroads.** *J. pastoral Care*, 1962, 16(2), 65-71.—An historical survey of clinical pastoral training [CPT] leads the author to recommend the pursual of 3 goals: (a) to incorporate CPT in theological education by extending faculty discussion and participation and by integrating clinical experience with academic and professional learning; (b) to experiment with forms and content of education for the pastoral ministry by integrating CPT with field work, pastoral care, religious education, social ethics, and theology; and (c) to enlarge the concern and participation of entire faculties in the ministry of pastoral care in the school, the church, and the community.—*O. Strunk, Jr.*
4103. Moss, C. Scott; Logan, James C., & Lynch, Dorothy. (National Inst. Mental Health, San Francisco) **Present status of psychological research and training in hypnosis.** *Amer. Psychologist*, 1962, 17(8), 542-549.—Anonymous questionnaires on training and research in hypnosis were returned by 54 of 55 psychology department chairmen with approved clinical psychology training programs and 39 of 85 American Medical Association approved medical schools, 8 psychology departments and 2 medical schools have courses in hypnosis. Unless the "psychological profession is more active in protecting its rights to research and clinical use of a methodology which is basically psychological, it may find itself legally excluded from the field."—*S. J. Lachman.*
4104. Nance, R. Dale. (U. Wisconsin) **Current practices in teaching history of psychology.** *Amer. Psychologist*, 1962, 17(5), 250-252.—150 returns from departments of psychology in the 168 American schools listed in the December 1960 issue of the *American Psychologist* indicate that most schools (130 of 150) teach a history course. "In a large majority of the departments, History is treated as a three-credit, one-semester course." The textbook most commonly used (75%) was the one by Boring. Others used were Murphy, Woodworth, Chaplin and Krawiek, Heidebreder, Dennis, and Wolman.—*S. J. Lachman.*

4105. Rosenzweig, Saul; Bunch, Marion E., & Stern, John A. (Washington U., St. Louis) **Operation Babel: A survey of the effectiveness of the foreign language requirements for the PhD degree in psychology.** *Amer. Psychologist*, 1962, 17(5), 237-243.—681 usable questionnaire returns were received from PhD psychologist respondents. Since completing the language requirements 65% or almost $\frac{2}{3}$ of the cases had not read a single item (article or book). "The median number of items read in French, German, Spanish, and Russian was 0." 70% made no oral use of the languages. There is an "extreme incongruity between input and output" in the study of foreign languages at the PhD level. Alternative solutions are proposed.—S. J. Lachman.

4106. Ross, Sherman. (American Psychological Ass.) **APA approved doctoral programs in clinical and in counseling psychology, 1962.** *Amer. Psychologist*, 1962, 17(7), 501-502.—"On recommendation of the Committee on Evaluation, the Education and Training Board, with the concurrence of the Board of Directors of the American Psychological Association has approved the doctoral programs in clinical psychology and in counseling psychology that are conducted by the institutions listed." 60 institutions are in the clinical psychology list; 8 of these have received interim approval while the others have full approval. 25 institutions are in the counseling psychology list; 2 of these have interim approval.—S. J. Lachman.

4107. Ross, Sherman. (American Psychological Ass.) **Internships for doctoral training in clinical psychology approved by the American Psychological Association.** *Amer. Psychologist*, 1962, 17(8), 571-572.—"On the recommendation of the Committee on Evaluation, the Educational Training Board with the concurrence of the Board of Directors of the American Psychological Association has approved for doctoral training in clinical psychology the internships offered by the agencies listed." Each internship facility is designated by a letter to indicate which of 3 types of internship it provides.—S. J. Lachman.

PSYCHOLOGY ABROAD

4108. Anon. **Ob issledovaniakh po probleme "fiziologii."** [On investigations on the problem "physiology."] *Vestn. Akad. Nauk SSSR*, 1962, 32(5), 110-111.—In a decree of the Presidium of the USSR Academy of Sciences it is noted that, while progress has taken place in Soviet physiology during recent years, real deficiencies continue in a number of problem areas. There must be, hereafter, "wide application of contemporary methods of research," and there must be a "fundamental improvement in the equipping of physiological institutions with the latest apparatus." There should be "integrated research involving mathematicians and physicists. Account should be taken of the problems and concepts of biological and medical cybernetics."—I. D. London.

4109. Brehaut, Willard; & Jackson, Robert W. B. (U. Toronto, Ontario, Canada) **Educational research in countries other than the United States: Canada.** *Rev. educ. Res.*, 1962, 32(3), 234-246.—Education is a provincial responsibility in Canada. For this reason, there is not 1 Canadian system of education but 11. Practically all university colleges of education are centers of research activities.

In addition, several universities serve as training grounds for research workers. Contributors have tended to avoid doing fragmentary research but instead have undertaken coordinated studies of major educational problems. The 1st of these types is the longitudinal study of students in an effort to find out the extent of wastage of student ability at high school and university levels. The 2nd type of significant research is related to administration and supervision of education in Canadian school systems. (65 ref.)—F. Goldsmith.

4110. Bronfenbrenner, Urie. (Cornell U.) **Soviet methods of character education: Some implications for research.** *Amer. Psychologist*, 1962, 17(8), 550-564.—"Communist authorities view as the primary objective of education not the learning of subject matter but the development of what they call 'socialist morality.'" The popularity and influence of Anton Semyonovich Makarenko "are roughly comparable to those of Dr. Spock in the United States, but his primary concern is not with the child's physical health but with his moral upbringing." Makarenko's theories and techniques became widely adopted throughout the USSR and now constitute the central core of Soviet educational practice. Major sections are: The Work and Ideas of A. S. Makarenko, Socialization in the School Collective, Guiding Principles of the Soviet Approach to Character Training, The Family versus the Collective, Group Incentives, and Group Criticism and Self-Criticism.—S. J. Lachman.

4111. Glass, Y. **Social psychological research in industry: An appraisal of problems and techniques.** *Psychol. Afr.*, 1962, 9, 133-147.—The problems encountered in planning, organizing, and executing industrial research among African workers is described and examined. Most of the research has been done by the National Institute for Personnel Research. The problems are discussed in the categories: sociocultural, industrial, technical, and methodological. Examples are given.—J. L. Walker.

4112. Grosfeld, J. A. M. (Catholic U., Nijmegen, Netherlands) **Some trends in European test research.** *Gauein*, 1961, 11(1), 48-62.—Research institutes in different countries were visited to observe methods for improving selection procedures and prediction of a successful career. Sweden's realistic attitude towards techniques of evaluating personality includes the use of an electronic "distributor" machine. Reliability studies of the machine records showed very good results ($r_{tt} = .90$ or more). Germany, Great Britain, and France share the same dislike (less pronounced in France) of tests, preferring group- and interview-techniques which are supported by excellent research in France but almost none in the other countries. New German methods include the use of graphology (correlation .44), the Pauli Kraepelin Test (correlation .40) and the "Task Organization Test." (20 ref.)—J. A. Lucker.

4113. Hotyat, Fernand, & Mialaret, Gaston. (Higher Educational Inst., Hainaut, Morlanwelz, Belgium) **Educational research in countries other than the United States: French-speaking countries—Belgium, France, and Switzerland.** *Rev. educ. Res.*, 1962, 32(3), 298-307.—One of the most striking characteristics of the development of and research into education in the French-speaking countries is the diversification of professional backgrounds

of individuals who are actively participating. The disciplines of medicine, sociology, and psychology have displayed a keen interest in education. Research which follows scientific principles is gradually gaining ground in the search for solutions to problems. Several research centers have been joining together to share their experience. L'Association Internationale de Pédagogie Expérimentale de la Langue Française was founded in 1958 with the purpose of further coordinating activities and promoting the advance of educational research. (35 ref.)—*F. Goldsmith.*

4114. Hudson, W. **National Institute for Personnel Research.** *Psychol. Afr.*, 1962, 9, 13-21.—The research in the areas of labor selection and utilization, test construction and experimental design, and experimental services performed by the institute for the years indicated is summarized. The history of the institute together with photographs are presented.—*J. L. Walker.*

4115. Muzić, Vladimir. (Inst. Education, U. Zagreb, Yugoslavia) **Educational research in countries other than the United States: Yugoslavia.** *Rev. educ. Res.*, 1962, 32(3), 332-343.—Although subjective judgment still plays a large part in decisions about most practical educational problems in Yugoslavia, research is assuming an increasingly important role. However, there are 3 major problems that remain to be solved: (a) the coordination of the plans and activities of the different research agencies, so as to avoid a fragmentary approach and effect a balanced and comprehensive research program; (b) the provision of adequate research facilities and equipment; and (c) the provision of an adequate number of specialists in educational research. Despite the magnitude of these problems, the increase in educational research evidenced by teachers and the official agencies gives reason for optimism concerning their ultimate solution. (82 ref.)—*F. Goldsmith.*

4116. Nielson, G. (Ed.) **Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs.** Copenhagen, Denmark: Munksgaard, 1962. 132 p.—(See 37: 4077, 4087, 4093, 4095, 4790, 4796)—*B. T. Jensen.*

4117. Nielson, G. (Ed.) **Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research.** Copenhagen, Denmark: Munksgaard, 1962. 229 p.—(See 37: 4787, 4864, 4925, 4932, 4958, 4977, 4998, 5040, 5062, 5069, 5436)—*B. T. Jensen.*

4118. Nielson, G. (Ed.) **Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education.** Copenhagen, Denmark: Munksgaard, 1962. 197 p.—(See 37: 4677, 4691, 4717, 4730, 4733, 4746, 4754, 4973, 5547, 5552, 5569, 5604, 5668)—*B. T. Jensen.*

4119. Nielson, G. (Ed.) **Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology.** Copenhagen, Denmark: Munksgaard, 1962. 211 p.—(See 37: 4414, 4708, 4854, 4865, 5138, 5173, 5309, 5310, 5311, 5312, 5386, 5497)—*B. T. Jensen.*

4120. Nielson, G. (Ed.) **Proceedings of the XIV International Congress of Applied Psychol-**

ogy. Vol. 5. Industrial and business psychology. Copenhagen, Denmark: Munksgaard, 1962. 229 p.—(See 37: 4208, 4961, 5650, 5691, 5694, 5695, 5698, 5791, 5804, 5812, 5813, 5819, 5842, 5859, 5861, 5868)—*B. T. Jensen.*

4121. Parkyn, George W. (New Zealand Council Educational Research, Wellington, New Zealand) **Educational research in countries other than the United States: New Zealand.** *Rev. educ. Res.*, 1962, 32(3), 225-233.—Educational research in New Zealand is supported by, and for the most part carried out under the auspices of, 3 different kinds of educational institutions: the universities, the New Zealand Department of Education, and the New Zealand Council for Educational Research. The somewhat unusual administrative structure of New Zealand primary education, in which much of the control of the schools is placed in the hands of district boards of education that do not levy their own education taxes but receive their funds from the central government, was the subject of a thorough analysis with a view to solving some of the problems of centralized vs. decentralized control. (78 ref.)—*F. Goldsmith.*

4122. Radford, William C. (Australian Council Educational Research, Melbourne, Australia) **Educational research in countries other than the United States: Australia.** *Rev. educ. Res.*, 1962, 32(3), 217-224.—There has been a noticeable increase since 1956 in published research in Australia. It is impossible to refer to all published materials, but those cited in the bibliography are representative of the work done. A considerable volume of research was undertaken on enrollments and on success and failure of university students. At the same time that the student and his approach to his work were receiving attention, some universities were giving consideration to means of improving the quality and type of teaching. Sociologically oriented research has generally been exact and careful, and it has revealed many important facts and problems. (43 ref.)—*F. Goldsmith.*

4123. Roca, Pablo. (Pan American Union, Washington, D. C.) **Educational research in countries other than the United States: An overview of educational research in Latin America.** *Rev. educ. Res.*, 1962, 32(3), 247-249.—Latin America is a term used for convenience to describe an area covering 20 independent nations located in North, Central, and South America, in which 3 different languages are spoken. In an area with so many basic educational problems, research in education might be looked at as an item of luxury or as an academic exercise to which only a few curious scholars devote part of their time. However, since the area covered by the term Latin America includes a large variety of stages of educational development, the field of educational research reflects the same levels of development.—*F. Goldsmith.*

4124. Smilansky, Moshe. (Henrietta Szold Inst., Jerusalem, Israel) **Educational research in countries other than the United States: Israel.** *Rev. educ. Res.*, 1962, 32(3), 280-293.—In Israel some success has been achieved in combating research and experimentation with practical measures designed to improve the education of children. The work is not free from handicaps. Adequately qualified workers are hard to find, new tools of evaluation have to be

evolved, funds are never adequate for the magnitude of the task. However, all these handicaps are natural and inevitable in a young country with limited resources. It is still too early to evaluate the work because it is still in its beginnings. However, one achievement is already evident: a growing appreciation for the contribution that educational research and experimentation can make toward an improvement in methods of child care and education. (20 ref.)—*F. Goldsmith.*

4125. Von Friedeberg, Ludwig. (Inst. Social Research, Frankfurt, West Germany) **Educational research in countries other than the United States: West Germany.** *Rev. educ. Res.*, 1962, 32 (3), 308-319.—So far as scientific questions of content and pedagogical questions of instructional methods are concerned, no other subject taught in the high schools is so deeply influenced by social factors as political education in the school subjects of civics, government, and history. During the past 50 years, teachers in Germany have had to make their pupils familiar with no fewer than 5 different political systems, only one of which (constitutional monarchy) could claim the advantage of possessing long-established traditions. Today, as a result of this checkered history and its dire consequences, 2 different kinds of political education are imparted in either part of divided Germany: (a) social education organized on a representative and democratic basis for pupils in the Federal Republic, and (b) dialectic materialism with its Eastern European stamp, for pupils in the East German Democratic Republic.—*F. Goldsmith.*

4126. Wall, W. D., & Miller, K. M. (National Found. Educational Research England & Wales, London) **Educational research in countries other than the United States: The United Kingdom.** *Rev. educ. Res.*, 1962, 32(3), 354-360.—Research in education in the United Kingdom has slowly become more coherent, less dependent upon isolated workers, more interdisciplinary, and more long-term in its objectives than it was during previous years. There is a marked tendency for a few university departments of education to concentrate their work for higher degrees around a principal theme or themes in such a way as to develop a significant body of related studies. Outstanding examples of this orientation include the work on thought processes and on child development at Birmingham, the broadly conceived measurement surveys at Manchester, and the systematic inquiries into Piaget's hypotheses at Leeds. (43 ref.)—*F. Goldsmith.*

4127. Wingard, P. G. (Makerere University Coll., Kampala, Uganda) **Educational research in countries other than the United States: East Africa.** *Rev. educ. Res.*, 1962, 32(3), 293-297.—Education in the East African nations—Kenya, Tanganyika, Uganda, and Zanzibar—has naturally been greatly influenced by British practices and thinking in education. Considerable efforts have been made to adapt the system and the instruction to local needs, but such efforts cannot as yet be based on the findings of fundamental research. Most of the basic information that is available in Europe and America is lacking in East Africa.—*F. Goldsmith.*

4128. Yoda, Arata, & Hidano, Tadashi. (U. Tokyo, Japan) **Educational research in countries other than the United States: Japan.** *Rev. educ.*

Res., 1962, 32(3), 265-279.—Studies on the problems and dynamics of the class as a group have been strongly influenced in Japan by the group dynamics movement in the United States. Recent studies on the evaluation of achievement have focused on such problems as the analysis of the environmental conditions that influence scholastic achievement, including physical isolation and educational upheaval resulting from typhoon damage. There seem to be 2 main trends in the area of personality tests and projective techniques at the present time: (a) the construction and standardization of new tests for the Japanese population and (b) the application of tests developed in the United States. With the rapid increase in the number of television sets in recent years, many research agencies have turned their attention to the influence of this mass medium on Japan's younger generation. (129 ref.)—*F. Goldsmith.*

EXPERIMENTAL PSYCHOLOGY

4129. Crowder, William F. (U. Mississippi) **A simplified constant-current shocking circuit.** *Amer. J. Psychol.*, 1962, 75(2), 306-307.—This circuit provides the high degree of current regulation yielded by electronic methods as well as the economy and convenience of the series resistance method. It requires alternating current. Punishment for locomotion by the S should be minimized.—*R. D. Nance.*

PSYCHOPHYSICS

4130. Braunstein, Myron L. (Cornell Aeronautical Lab.) **An automatic apparatus for the continuous method of limits.** *Amer. J. Psychol.*, 1962, 75(2), 309.—A device to obtain threshold measurements when they must be determined quickly. After S signals that he perceives a difference, stimulus-intensity continues to change in the same direction for a brief interval, varied from trial to trial in a pseudo-random manner. Direction of the change is then reversed. This alternation is continued as long as desired. The method assures independence of successive determinations and minimizes adaptation. Apparatus includes a motor driven cam in which 3 irregularly spaced grooves are cut. These activate a microswitch which activates relays controlling direction of change of stimulus intensity. Reliable brightness-difference thresholds have been determined in 90 sec. while S was exposed to various levels of acceleration.—*R. D. Nance.*

4131. Cornsweet, Tom N. (U. California, Berkeley) **The staircase method in psychophysics.** *Amer. J. Psychol.*, 1962, 75(3), 485-491.—The author illustrates the use of the method, discusses relative merits and demerits, and describes a modification which overcomes certain of the disadvantages. The change in procedure involves running 3 series of staircased stimuli concurrently, according to a predetermined randomized sequence.—*R. D. Nance.*

4132. Parducci, Allen, & Marshall, Louise M. (U. California, Los Angeles) **Assimilation vs. contrast in the anchoring of perceptual judgments of weight.** *J. exp. Psychol.*, 1962, 63(5), 426-437.—"A successful replication was described for a recent demonstration of assimilation, rather than the usual contrast, in the anchoring of lifted weights. This assimilation was interpreted as a special case of the

central-tendency effect, with the anchor serving as the standard for comparative judgments. . . . While it was necessary to invoke self-anchoring to explain assimilation to an unlabeled stimulus, this permitted reduction of all cases of assimilation to simple perceptual contrast. The analysis suggested that various procedures for absolute and comparative judgment are distinguished primarily on the basis of the nature and degree of specification of the rules for judgment."—*J. Arbit.*

4133. Sorkin, Robert D. (U. Michigan) Extension of the theory of signal detectability to matching procedures in psychoacoustics. *J. Acoust. Soc. Amer.*, 1962, 34(11), 1745-1751.—The theory of signal detectability is used to analyze experiments where the O's task is to state, after 2 signal presentations, whether the signals were the same or different. A model is suggested for predicting performance in auditory "matching" tasks using data from detection and discrimination experiments. 3 experiments are discussed which lend support to the model's application.—*A. M. Small, Jr.*

4134. Stevens, S. S. (Harvard U.) The quantification of sensation. *Daedalus*, 1959, 88(4), 606-621.—Evidence is presented that prothetic sensory continua obey a power law so that the magnitude of sensation grows as a power function of the stimulus magnitude. The implication of this law is that equal stimulus ratios produce equal subjective ratios. For example, no matter at what level of energy one begins, a ninefold increase in the energy of light doubles its apparent brightness. Several experiments designed to test this law are discussed.—*K. E. Davis.*

4135. Weintraub, D. J., & Hake, H. W. (U. Illinois) Visual discrimination: An interpretation in terms of detectability theory. *J. Opt. Soc. Amer.*, 1962, 52(10), 1179-1184.—Geometric squares, and rectangles (squares vertically elongated by 2%), were presented singly in a random sequence to 3 observers. By using the detectability-model parameter d' as a measure, average discriminability was found to be 1.32. 2-, 3-, and 4-category response scales were shown to give equivalent discriminability data. Discriminability was not significantly affected by the inclusion of an extraneous stimulus (a square vertically elongated either 1% or 3%) interspersed randomly in the square-rectangle sequence without the observers' knowledge. The data were interpreted as a favorable empirical test of detectability-theory assumptions applied to a visual discrimination task.—*Journal abstract.*

PERCEPTION

4136. Ammons, C. H., & Ammons, R. B. (Montana State U.) Perception bibliography: II. Baldwin's dictionary through 1882. *Percept. mot. Skills*, 1962, 15(1), 259-262.—One of a continuing series of sequential unannotated bibliographies.—*W. H. Guertin.*

4137. Arana, L., & Sokolov, E. N. (Moscow State U., USSR) Stokhasticheskaia teoriia vospriiatiia: Soobshchenie I. Vospriatie elementarnykh izobrazhenii, kharakterizuiushchikhsia ravnoi veroiatnost'iu poiavleniia. [The stochastic theory of perception: Communication I. Perception of elementary figures characterized by equal probability of occurrence.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 4, 61-63.—4 blindfolded Ss were instructed

to localize checkers on a square board of 25 equal cells separated by elevated borders. In Series I the perceptual figure consisted of one checker which would appear with equal probability on all the 25 cells. It was found that under these conditions both the searching plan and the RT remained unchanged throughout the trials.—*A. Cuk.*

4138. Arana, L., & Sokolov, E. N. (Moscow State U., USSR) Stokhasticheskaia teoriia vospriiatiia: Soobshchenie II. Vospriatie elementarnykh izobrazhenii, kharakterizuiushchikhsia razlichnoi veroiatnost'iu poiavleniia. [The stochastic theory of perception: Communication II. Perception of elementary figures characterized by different probability of occurrence.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 4, 65-69.—In Series II the checker was presented to Ss in the same cell. The probability in this case was varying: it was of $\frac{1}{25}$ before the 1st trial, of $\frac{2}{25}$ before the 2nd trial, etc. Under these conditions, the perceptual process was rapidly simplified (both the plan of search and the RT). The following generalization was drawn: "perceptual time becomes minimal when the probability calculated from a limited number of choices equals unity."—*A. Cuk.*

4139. Arana, L., & Sokolov, E. N. (Moscow State U.) Stokhasticheskaia teoriia vospriiatiia: Soobshchenie III. Sokrashchenie vospriiatiia izobrazhenii, sostoiashchikh iz neskol'kikh tochek. [The stochastic theory of perception: Communication III. A reduction in the perception of figures consisting of several points.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 5, 85-88.—2 new conditions were used. Ss were asked to first identify one checker placed in the different cells and occurring with equal probability, and then to identify a complex figure of 3 checkers occurring in 3 different places. 2 conclusions were drawn: (a) computation of probabilities takes into account not isolated elements but those which are specially grouped together and (b) a complex figure can be perceived just by touching one of the elements provided the elements form a system.—*A. Cuk.*

4140. Arana, L., & Sokolov, E. N. (Moscow State U., USSR) Stokhasticheskaia teoriia vospriiatiia: Soobshchenie IV. Osiazatel'noe vospriatie bukvennykh izobrazhenii. [The stochastic theory of perception: Communication IV. The tactile perception of letter figures.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 61-65.—The experiment was made more complex by having the Ss recognize by touch, letters of the Russian alphabet made up of checkers. The probability of occurrence of each letter was the same. It was found that in order to identify the letters it was not necessary to touch all the letter's but just the key points.—*A. Cuk.*

4141. Arana, L., & Sokolov, E. N. (Moscow State U., USSR) Stokhasticheskaia teoriia vospriiatiia. Soobshchenie V. Osiazatel'noe uznavanie neizvestnykh slozhnykh izobrazhenii. [The stochastic theory of perception. Communication V. Tactile recognition of unknown complex figures.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, 1, 71-72.—When Ss were taught to reproduce nonsense figures made of checkers, it was found that the speed and the accuracy of their responses depended upon the probability of occurrence of certain combinations and upon the mutual disposition of elements.—*A. Cuk.*

4142. Baker, Robert A., Ware, J. Roger, & Sipowicz, Raymond R. (USA Armor Human Research Unit, Fort Knox) **Vigilance: A comparison in auditory, visual, and combined audio-visual tasks.** *Canad. J. Psychol.*, 1962, 16(3), 192-198.—Ss monitored brief interruptions of a continuously presented sound, light source, or both, for a 3-hour period. The differences between the group given simultaneous auditory and visual signals and the 2 control groups were not significant. There was no evidence of intersensory interaction or arousal effects.—R. S. Davidson.

4143. Beach, L. R. **A study of inference behavior.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-5001, Subtask 12, Rep. No. 2, ii, 44 p.—This report presents and tests a theory of how Ss use probabilistic cues in order to make inferences about objects. The experimental results indicated that Ss can use the cues and that, within limits, the theory can predict their responses. These results were interpreted as sufficient to warrant further development of the theory.—USN SAM.

4144. Fisher, Gerald H. (U. Durham, England) **Phenomenal causality in conditions of intrasensory and intersensory stimulation.** *Amer. J. Psychol.*, 1962, 75(2), 321-323.—If a visual stimulus is brought toward another which moves away on apparent impact, S describes the 2nd stimulus as in some way set into motion by the 1st. This phenomenon has been interpreted as a basic element of perception. It should follow that this experience is also available in nonvisual senses which handle spatial information and that it should be evident in "intersensory" conditions. Experiments were conducted with 51 naive Ss in both "intrasensory" and "intersensory" conditions. 46 Ss made a causal response. Once a causal response was made it was not changed. The findings appear to support the presence of a central integrating system.—R. D. Nance.

4145. Kelm, H. (Saskatchewan Hosp., Weyburn) **Consistency of successive time estimates during positive feed-back.** *Percept. mot. Skills*, 1962, 15(1), 216.—Repeat runs of Llewellyn-Thomas' method (positive feed-back) of studying time estimation gave consistent results. Furthermore, since this technique seems to amplify S's error, it may be valuable in studying the effects of certain drugs and psychiatric disorders.—W. H. Guertin.

4146. Levialdi, Andrea. (U. Buenos Aires, Argentina) **A physical model of perception as an integrating process.** *Amer. J. Psychol.*, 1962, 75(2), 325-326.—"Information" is the body of signals that must be transmitted and received to complete a particular process. If any signal less intense than the background noise is cut out, information will be affected. Any such signal when integrated over a sufficiently long period gives a detectable result greater than zero. It would be important to be able to state that even some of the subliminal signals are essential "since any stimulus acts on living cells in a different manner according to whether it is preceded by another stimulus."—R. D. Nance.

4147. Mooney, Craig M. **Perception as related to military problems.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 260-274.—A "brief and obviously incomplete sketch of perceptual needs and possibilities in the military field." The

problems pointed up "are not peculiar to military life except, perhaps, in being especially urgent there, and, therefore, especially interesting to military psychologists."—G. H. Mowbray.

4148. Rabinovich, P. L. (Moscow, USSR) **Znachenie tempa afferentnoi stimulatsii dlia urovnia funktsional'noi podvizhnosti kory golovnogo mozga.** [Significance of the rate of afferent stimulation for the level of the functional mobility of the cortex.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 40-43.—Adult Ss were used (age 20-22). The index of the functional mobility of the cerebral cortex was determined by a method defining the maximum rhythm of colored light stimuli reproduced by the Ss. Proprio- and interoceptive stimuli arising from walking at a rapid and slow pace (120 and 60 steps per minute) were used as the source of afferent stimuli. The index of functional mobility was established before and after the walking exercise. It was found that the level of cortical functional mobility depends upon the rate of afferent stimulation: the rapid stimulation accounts for its increase, the slow stimulation for its decrease.—A. Cuk.

4149. Shevarëv, P. A. (Ed.) **Vospriiatie i myshlenie.** [Perception and thinking.] *Izv. Akad. Pedag. Nauk RSFSR*, 1962, No. 120, 118 p.—These transactions of the Institute of Psychology present the results of research on the "structure of perception." Included are studies on (a) reaction time as an indicator of perceptual structure, (b) role of verbal instructions in perception, (c) conditions determining perceptual structure, (d) dependence of perceptual structure on individual differences, and (e) perception of deviation of lines from given inclinations. There is also included a study on the psychology of deductive reasoning.—I. D. London.

4150. Vinoda, K. S., & Govindaswamy, M. V. **Sensory awareness to significance.** *Pratibha*, 1959, 2(1), 100-106.—Perception depends on both subjective factors (e.g., motivation, interest, set, habits, values) and objective factors (e.g., intensity of the stimulus, novelty of the stimulus, frequency of its occurrence, size of the stimulus). The various implicit clues in depth perception are: interposition, size and linear perspective, serial perspective, light and shade, movement, and fixation. These are certain proprioceptive clues arising from contractions and tensions of the eye muscles (convergence and accommodation) and rational disparity. But ultimately "it is the mind of man that matters in perception and not the external nature."—U. Pareek.

4151. Wright, Benjamin. (U. Chicago) **The influence of hue, lightness, and saturation on apparent warmth and weight.** *Amer. J. Psychol.*, 1962, 75(2), 232-241.—Belief that color can impart effects such as apparent warmth and weight is ancient and widespread. Most previous studies on this have failed to deal explicitly and successfully with the 3 basic perceptual dimensions of color or have confused the different modes of perception. The present study corrects some of the weaknesses of earlier ones. Ss were middle and lower class men and women living in urban West Germany in 1957. Each judged a 3-in. square of dull finish surface color in daylight against a neutral background. Judgments of warmth and weight were expressed on an Osgood semantic differential. 3569 people participated. Ages ranged

from 16 to 65. There is a well-defined hue-effect on apparent warmth, independent of lightness or saturation. The effects of lightness and saturation on apparent warmth are less definitive than the effect of hue. There is a well-defined effect of lightness on apparent weight. The effect of saturation needs further investigation.—R. D. Nance.

Illusions

4152. Carpenter, Malcolm Scott; O'Keefe, John Aloysius, III, & Dunkelmann, Lawrence. (Manned Spacecraft Cent., Houston, Tex.) Visual observations of nightglow from manned spacecraft. *Science*, 1962, 138(Whole No. 3544), 978-980.—The luminous band around the horizon noted by J. Glenn in the first United States manned orbital flight is attributable to airglow. Dip-of-the-horizon measurements on the star γ Urase Majoris showed that the band is centered at an elevation of 91 kilometers or somewhat higher. The edge-on brightness of the airglow layer was 6×10^{-7} candles per square centimeter.—*Journal abstract*.

4153. Meyer, Max F. (Springfield, Va.) New illusions of pitch. *Amer. J. Psychol.*, 1962, 75(2), 323-324.—Auditory illusions involving pitch are as yet totally undescribed (excluding pathological instances). 2 cases are described. 3 concentric circles of equally distributed holes were bored in a 16-in. masonite disk. In 1 case, a blast of air is blown alternately at the inner and outer circles. In the other case, the disk is spun on a motor, and air is blown into the 3 circles. The brain tends to convey to consciousness adjusted and musical intervals as substitutes for unmusical ones.—R. D. Nance.

4154. Mountjoy, Paul T. (Denison U.) Decrement to the Müller-Lyer as a function of visual field size. *J. scient. Lab. Denison U.*, 1961, 45, 149-154.—The size of the visual field was changed between experimental sessions in a counter-balanced manner for 2 groups of 18 Ss. Since the size of the field had no effect upon intrasession decrement to the illusion, or upon intersession recovery, it was concluded that this variable was not responsible for the contradictory results of Köhler and the present investigator. The results were discussed in relation to Madison's mathematical model for figural after-effects.—*Author abstract*.

4155. Rock, Irvin, & Ebenholtz, Sheldon. (Yeshiva U.) Stroboscopic movement based on change of phenomenal rather than retinal location. *Amer. J. Psychol.*, 1962, 75(2), 193-207.—Despite countless investigations, stroboscopic movement remains unexplained. Gestaltists have hypothesized that the experience is based on some central physiological interaction which takes place in the cortex between the loci of excitation yielded by the light sources. Others have tried to show that the interaction is retinal or subcortical. 2 experiments were carried out. Under conditions where phenomenal separateness was experienced with only 1 region of the retina stimulated stroboscopic movement was experienced. When separate retinal points were stimulated but the source experienced in only 1 locality, movement was not experienced. Findings are consistent with the fact that motion is experienced whenever above-threshold change in phenomenal location of the source takes place. It is implied that neural

interaction between 2 loci of excitation cannot be a general explanation of stroboscopic movement.—R. D. Nance.

4156. Royce, Joseph R., Stayton, William R., & Kinkade, Robert G. (U. Alberta) Experimental reduction of autokinetic movement. *Amer. J. Psychol.*, 1962, 75(2), 221-231.—Experiment I determined the effect of various patterns of lighted dots on autokinetic movement. Experiments II and III determined the effects on autokinetic movement of (a) varying the radius of a concentric circle of light about a central dot and (b) varying the intensities of both the dot and the circle. 10, 18, and 103 Ss, respectively, were used in the 3 experiments. Results confirm the hypothesis that autokinetic movement will be reduced when the light is provided with a frame of reference. The more continuous the frame of reference, the greater the reduction effect. "In particular, the extent of perceived movement decreases (a) as the number of lights in a multiple-light configuration increases, (b) in the presence of a $\frac{1}{4}$ -in. wide concentric band of light, regardless of radius, and (c) as the light-intensity of the concentric circle increases."—R. D. Nance.

4157. Sugarman, L. P. Factors influencing apparent movement thresholds. *Psychol. Afr.*, 1962, 9, 204-215.—The factors influencing apparent movement (phi phenomenon) are reviewed and discussed: the apparatus and procedures are important determinants; apparent movement thresholds are unreliable; thresholds occurring at the beginning were more readily observed than those at the end; stimulus exposure duration and auditory stimulation did not affect thresholds; flash frequencies at which thresholds occur increase with age; alpha frequency showed no relationship with flash frequencies at which thresholds occur; and the observed sex differences are believed to be due to greater cerebral activation in females, "possibly caused by tension and anxiety associated with both biochemical and cultural factors." (31 ref.)—J. L. Walker.

4158. Vinoda, K. S. Analysis of factors contributing to illusions involving straight lines. *Pratibha*, 1959, 2(2), 77-80.—A project is briefly mentioned involving preparation of instruments to study illusions. 3 series of slides were prepared—those with varying distance between lines, those with variable lines enclosed in different frames, and those of filled figures. Other materials, e.g., open frames, horizontal vertical illusion figures, and Muller-Lyer illusion figures, are being prepared.—U. Pareek.

Aftereffects

4159. Bakan, Paul; Myers, Louis B., & Schoonard, James. (Michigan State U.) Kinesthetic aftereffects and length of inspection-period. *Amer. J. Psychol.*, 1962, 75(3), 457-461.—Most previous studies on temporal aspects of figural aftereffects have been concerned with vision. Increases in kinesthetic aftereffect as a function of length of a single inspection-period have not been studied. In the present study, Ss were 80 undergraduate volunteers, divided into 1 control and 3 experimental groups. Apparatus consisted of 3 long wooden blocks mounted on tables. Inspection-periods were 0, 10, 30, or 60 seconds. Size of the aftereffect immediately after

an inspection-period is a monotonic increasing function of length of the period.—*R. D. Nance.*

4160. Bakan, Paul, & Thompson, Richard. (Michigan State U.) The effect of pre-inspection control measures on the size of kinesthetic after-effects. *Amer. J. Psychol.*, 1962, 75(2), 302-303.—It has been implicitly assumed that pre-inspection, control judgments do not themselves influence after-effects. 2 groups of 39 blindfolded undergraduates served as Os. Those in Group I made 8 pre-inspection judgments of the standard stimulus; those in Group II made none. The apparatus consisted of 3 long wooden blocks mounted on tables. No statistically significant difference between the groups was found on postinspection judgments. Direction of the observed difference suggested larger aftereffects for Group II.—*R. D. Nance.*

4161. Dinnerstein, A. J., Lowenthal, M., Marion, R. B., & Olivo, J. (New York Medical Coll.) Pain tolerance and kinesthetic after-effect. *Percept. mot. Skills*, 1962, 15(1), 247-250.—Correlations between pain tolerance and kinesthetic size judgment were previously explained as a subjective augmenting or reducing of sensory inputs. The present data do not fit the above assumption and are better explained by a satiation process. However, the results do confirm the value of the kinesthetic aftereffect test as predictor of pain tolerance.—*W. H. Guertin.*

4162. Duncan, Carl P. (Northwestern U.) Amount and rate of decay of visual figural after-effect as functions of type of inspection-stimulus and inspection-time. *Amer. J. Psychol.*, 1962, 75(2), 242-250.—The 1st hypothesis was that initial amount of aftereffect would not vary with duration of inspection-period but that rate of decay of aftereffect would be inversely proportional to duration of inspection-period. It was also hypothesized that initial amount of aftereffect would vary as a function of width and type of inspection-stimulus. Inspection periods were 15 sec. or 60 sec. Inspection-stimuli were of 2 widths and 2 types (solid or outline). There were 32 Ss in each of 8 experimental conditions and 32 controls Ss. The task involved adjusting 2 hairlines equidistant from a central point. The control group did not view the inspection stimuli. Results support the 1st hypothesis but not the 2nd.—*R. D. Nance.*

4163. George, F. H. (U. Bristol) Acuity and the statistical theory of figural aftereffects. *J. exp. Psychol.*, 1962, 63(5), 423-425.—"This experiment was an attempt to reinstate the Osgood-Heyer (1952) model for explanatory purposes in perception, with the object of making plausible extension of that model in order to explain movement aftereffects. The experiment involved sets of double-line figures at various distances from a fixation point and Ss were unable to distinguish the two lines when sufficiently far from the fixation point, and under conditions of 'fatigue.' Thus, the principal features of the Osgood-Heyer model can easily be preserved from the main objections made against them by Deutsch (1956)."—*J. Arbit.*

4164. Holland, H. C. (Maudsley Hosp., Denmark Hill, London, England) Massed practice and reminiscence as a function of the distribution of trials on the rotating spiral. *Life Sci.*, 1962, No. 8, 405-409.—An experiment is described aimed at de-

termining the effect on the reminiscence phenomenon of the spiral negative aftereffect under "massed" practice conditions, and following the introduction of scheduled rest pauses between trials, i.e., distributed practice. 2 functions are outlined which are not dissimilar. Both are thought to represent aspects of the accumulation of reactive inhibition and its dissipation during rest.—*C. T. Morgan.*

4165. Noizet, Georges. Un indice de régularité dans les oscillations de la perception. [A regularity index in the oscillations of perception.] *Psychol. Franc.*, 1962, 7(2), 134-146.—An experiment, using 2 reversible perspectives and 1 ambiguous figure, was performed on 46 Ss for the purpose of studying the effects of sensory satiation on perceptual oscillations. The expected progressive increase in frequency of oscillations was confirmed but a delay was noted in the appearance of the stabilization period. A typological analysis revealed an increasing relation between frequency and regularity of oscillations. (29 ref.)—*C. J. Adkins.*

4166. Scott, Thomas R., & Medlin, Rufus E. (VA Hosp., Columbia, S. C.) Psychophysical measurement of the spiral after-effect. *Amer. J. Psychol.*, 1962, 75(2), 319-321.—Investigators of this phenomenon have used subjective reports of its presence or absence. An apparatus is described which makes possible accurate measurement of the rate of change of perceived size. S is required to fixate a rotating disk on which there is an Archimedes spiral centered at the point of rotation. The method of measurement involves alternate presentation of the spiral and a changing stimulus in a mirror tachistoscope. The apparatus is called the metamegethograph, abbreviated MMG.—*R. D. Nance.*

VISION

4167. Moore, E. W., & Cramer, R. L. Perception of postural verticality: Effects of flying experience upon reduction of error. *USAF SAM tech. docum. Rep.*, 1962, No. 62-72. 4 p.—Test pilots were compared with nonflyers on a task of bisecting an angle formed between a tilt 30° to the left and the upright with visual cues eliminated. 15 trials a day were given for 3 days. A significant reduction in errors demonstrated habituation for all Ss over the 3-day period with a uniform linear reduction within each day. No differences occurred between the experimental groups. Flying experience seems to have no relationship to a person's reduction of error in estimating a function of the postural vertical.—*M. C. Payne, Jr.*

Space Perception

4168. Calvi, G. La percezione della profondità su segnali in movimento: Comunicazione preliminare. [Perception of depth on moving signals: Preliminary communication.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(5), 443-454.—There is a constantly reducing distance between one signal and another with the increase of the speed of movement of the same signals.—*L. L'Abate.*

4169. Carlson, V. R. (National Inst. Mental Health) Adaptation in the perception of visual velocity. *J. exp. Psychol.*, 1962, 64(2), 192-197.—"The effect of adaptation to an orbitally rotating pattern on a subsequently presented moving test stimulus

was assessed using a procedure in which S is unaware of the occurrence of aftereffect. When adaptation and test motions were in the same direction, results were generally consistent with already known aftereffects of the waterfall-illusion type. But little or no aftereffect occurred when adaptation and test motions were in opposite directions. This finding agrees neither with Adaptation Level theory nor with Gibson's principle of negative aftereffect. It may, however, be related to the recent discovery of retinal units which are differentially sensitive to the direction of stimulus movement."—*J. Arbib.*

4170. Carlson, V. R. (National Inst. Mental Health) **Underestimation in size-constancy judgments.** *Amer. J. Psychol.*, 1962, 75(3), 462-465.—Size-constancy presumably represents the fundamental, natural relationship of perceived size to object-size. It may be possible to manipulate O's (Observer's) psychological state through administration of LSD, a drug which acts centrally. Os in the present experiment were 20 males, age 18-25, chosen from normal volunteers for medical research. The major result was that LSD produced relative size-underestimation only when the drug condition represented O's first experience with the experimental task. Different response-sets "were established during the first session, depending upon whether LSD or the placebo had been administered."—*R. D. Nance.*

4171. Churchill, A. V. (Defense Research Medical Lab., Toronto, Canada) **Supplementary report: Effect of mode of response on judgment of familiar size.** *J. exp. Psychol.*, 1962, 64(2), 198-199.—Ss estimated the size of objects which were verbally identified and reported their estimates either verbally or by separating 2 straight edges the appropriate amount. Consistent with previous studies was the finding of a high degree of accuracy when making verbal or physical estimates of familiar objects on the basis of memory alone. The mode of response had little effect on the accuracy of these estimations.—*J. Arbib.*

4172. Cohen, R. L. (U. Uppsala, Sweden) **A further study of velocity synthesis.** *Scand. J. Psychol.*, 1962, 3(3), 137-142.—A prediction as to the variation of estimates of Ss performing on the velocity synthesis apparatus, if the intensity of one of the twin spots were to be decreased, was made on the basis of the signal/interference approach. This prediction was then verified by experiment, where it was found that the mean score of a group of Ss estimating absolute velocity was influenced to a far greater extent than that of a group estimating relative velocity, when the intensity of one of the twin spots was decreased stepwise to a level just above the threshold value.—*Journal abstract.*

4173. Craig, E. A. (Lehigh U.) **A simple device for demonstrating binocular disparity effects.** *Percept. mot. Skills*, 1962, 15(1), 10.—A simple, inexpensive apparatus is described. When viewed with either eye alone, apparent depth is lost.—*W. H. Guertin.*

4174. Curran, C. R., & Lane, H. L. (U. Michigan) **On the relations among some factors that contribute to estimates of verticality.** *J. exp. Psychol.*, 1962, 64(3), 295-299.—"Several variables that have been shown to influence the perception of the upright were incorporated in a multidimensional de-

sign to permit analysis of their several effects and interactions. Minimal visual cues had a dramatic effect in reducing nonveridical perception of the vertical. Distortion of body tilt and balance produced effects of lesser magnitude. All the first- and second-order interactions of these variables had large and significant effects on perception of the upright."—*J. Arbib.*

4175. Dureman, I. (U. Uppsala, Sweden) **Factors influencing the apparent velocity of visual movement after-effects.** *Scand. J. Psychol.*, 1962, 3(3), 132-136.—Estimates of speed of apparent visual movement aftereffects (VMAE) were undertaken with induction speed varied in 5 logarithmic steps from 9° to 144° per sec. 2 alternative test intervals 0.5 and 1.0 sec. were used for intermittent inspection of a stationary target. At both inspection intervals VMAE-velocity estimates were found to vary in a systematic way with induction speed. Comparing values from the 2 test intervals, the 0.5 sec. interval was found to yield significantly higher speed of VMAE than the 1.0 sec. interval.—*Journal abstract.*

4176. Epstein, W. (U. Kansas) **Apparent shape of a meaningful representational form.** *Percept. mot. Skills*, 1962, 15(1), 239-246.—Results did not provide evidence that the representational character of a form affects its apparent shape, under the impoverished conditions of monocular vision and also under the conditions of unredacted binocular vision. In addition, the results suggest that familiarity is not a very influential variable.—*W. H. Guertin.*

4177. Epstein, William; Bontrager, Helen, & Park, John (U. Kansas) **The induction of non-veridical slant and the perception of shape.** *J. exp. Psychol.*, 1962, 63(5), 472-479.—"The experiment had three aspects: (a) to determine whether the slant-induction effect reported by Beck and Gibson (1955) would obtain when the background was slanted; (b) to test more precisely the slant-shape invariance hypothesis; and (c) to investigate the influence of three attitudes of observation on the perception of shape under monocular and binocular vision." The slant-induction effect was found when the background was slanted and also when it was perpendicular. Under no condition did the judgments of apparent slant and apparent shape covary exactly as demanded by the invariance hypothesis. The influence of attitudes on the perception of shape was restricted to the binocular viewing condition.—*J. Arbib.*

4178. Gibbins, K., & Howarth, C. I. (U. Hull, England) **The effect of intermittent illumination on the visual acuity threshold.** *Quart. J. exp. Psychol.*, 1962, 14(3), 167-175.—Senders (1949) reported that with intermittent illumination short flashes needed less energy than larger ones to make a visual acuity target visible. This apparent breakdown of the reciprocal relationship between time and intensity, which has been found almost universally by earlier workers under a very wide range of experimental conditions, raised a number of interesting theoretical issues such as the relationship between visual acuity and intensity discrimination thresholds, and the plausible importance of eye movements in each. Unfortunately we have been unable to repeat Senders' result in spite of the most determined efforts to reproduce her experimental conditions. We are

unable to suggest why our results differ from hers, but feel that our experiments at least show that her data are very difficult to reproduce and hence no general theoretical argument can be based on them. In view of this we felt at liberty to predict results on the basis of a model, we had tentatively constructed, which we regarded as integrating Bloch's and Talbot's laws. This enabled us to make predictions about the effect of frequency of repetitive stimulation on thresholds. Experiments were carried out to ascertain how far these predictions were substantiated.—*Journal abstract.*

4179. Gibson, James J., & Flock, Howard. (Cornell U.) **The apparent distance of mountains.** *Amer. J. Psychol.*, 1962, 75(3), 501-503.—The usual explanation of the illusion is the clearness of the air (i.e., absence of aerial perspective). The authors suggest another possible explanation. In the neighborhood of a mountain, distant earth shapes may be relatively large and thus reverse the normal optical gradient. Illusory perception depends on a combination of circumstances which holds for the particular situation and on the degree to which attention has been trained to register reliable information. The popular idea that clearness of mountain air explains misperception of distance is too simple.—*R. D. Nance.*

4180. Harcum, E. R., Filion, R. D. L., & Dyer, D. W. (Coll. William & Mary) **Distribution of errors in tachistoscopic reproduction of binary patterns after practice.** *Percept. mot. Skills*, 1962, 15(1), 83-89.—10-element binary patterns of blackened and open circles were exposed in a linear array across fixation. Contrary to hypothesis, differences in accuracy of perception between stimuli on opposite sides of fixation are not reduced after practice. Therefore, the decrease in errors with practice is concluded to be produced by familiarization of O with the experimental situation, and by increased over-all efficiency of the perceptual process.—*W. H. Guertin.*

4181. IArbus, A. L. (Inst. Biological Physics, Moscow, USSR) **O vospriatii mel'kaiushchikh izobrazhenii, nepodviznykh otноситel'no setchatki glaza.** [On perception of flashing images, stationary with respect to the retina of the eye.] *Biofizika*, 1962, 7(5), 615-618.—When an object is strictly stationary with respect to the retina, a single brief illumination of this object allows the eye to resolve small details on it. With periodic repetition of such illumination, beginning with frequencies of 2-4 per sec. and especially in the case of frequencies of 7-9 per sec., after several seconds there is a sharp reduction of the resolving power of the eye. The resolving power of the eye decreases very greatly when the flashing light, on reflection by the object and impingement on the sclera, is scattered over the entire retina. Under these circumstances all differences in the field of vision may disappear.—*I. D. London.*

4182. Kragh, U. (Lund U., Sweden) **Subliminal gradation in the visual field.** *Scand. J. Psychol.*, 1962, 3(3), 165-170.—The difference of thresholds for correct recognition of a central figure and of a peripheral figure in the same picture, presented by the tachistoscope, is referred to 2 factors: foveal vs. extrafoveal stimulation, and threat towards the central figure (in terms of "perceptual defense"). Differences of size of the figures, again, do not effect

"subliminal gradation." The analysis is considered relevant for the comparison between 2 tachistoscopic techniques: one in which one subliminal stimulus is exposed immediately before a liminal one, and the other with only one subliminal stimulus. (22 ref.)—*Journal abstract.*

4183. Lepley, William M. (Pennsylvania State U.) **An apparatus for the study of binocular rivalry.** *Amer. J. Psychol.*, 1962, 75(2), 310.—Designed to increase binocular rivalry, 2 targets (identical Plateau spirals) are rotated in opposite directions by a variable speed motor and are viewed through the eye-pieces of a Brewster stereoscope. Research possibilities of the apparatus have not yet been explored.—*R. D. Nance.*

4184. Levonian, Edward. (U. California, Los Angeles) **Perceptual threshold of discrete movement in motion pictures.** *J. Soc. Motion Pict. TV Engineers*, 1962, 71, 278-281.—Using the method of single stimuli and 4000 judgments, thresholds for discrete movement, which is defined as image skip between frames, were determined. The thresholds were expressed in visual angle between the images on 2 successive frames and are considered to constitute lower bounds for normal film conditions employing background luminance values between 1 and 16 foot-lamberts. The results show that the threshold decreases with an increase in background luminance and a decrease in line width.—*R. L. Sulzer.*

4185. Mandriota, Frank J., Mintz, Donald E., & Notterman, J. M. (Princeton U.) **Visual velocity discrimination: Effects of spatial and temporal cues.** *Science*, 1962, 138(Whole No. 3538), 437-438.—Weber ratios were obtained for visual velocity discrimination under 3 topographic conditions with the same Ss and psychophysical procedures. The conditions differed regarding the presence of either temporal or spatial cues, these being correlated in magnitude with stimulus velocity. Systematic effects of the cues upon the level of velocity discrimination were noted.—*Journal abstract.*

4186. Nelson, T. M., & Bartley, S. H. (Michigan State U.) **A theoretical study of shape and proportion.** *Psychol. Rec.*, 1962, 12, 67-73.—"A white disk lacking visible texture was placed in several types of visibility structured surrounds. S responded by drawing the shape of the target and by representing the proportions. The results indicate that shape and proportion responses are distinct from each other. Changes in the nature of the area external to the area seen bounded by the edge affect shape responses more than proportion responses."—*R. J. Seidel.*

4187. Pollack, R. H., & Chaplin, Mary Rose. (U. Sidney, Australia) **Some methodological problems in microgenetic investigation.** *Amer. J. Psychol.*, 1962, 75(3), 495-499.—"Microgenesis" refers to the sequence of events occurring between presentation of the stimulus and formation of a single, stabilized cognitive response. Previous investigations of microgenesis may be criticized for at least 3 weaknesses in methodology. Possible ways to overcome each of these are suggested. A pilot study of the microgenesis of form-perception is reported.—*R. D. Nance.*

4188. Porter, Paul B. (U. Utah) **A general gradient theory of spatial vision.** *Ann. N. Y. Acad.*

Sci., 1962, 93, 751-760.—Bidimensional form in visual space perception is explained by physiological optics and local sign. Depth perception is explained by primary and secondary cues. Gibson suggested that these cues were all gradients of retinal stimulation. Distance on the ground, relative size, linear perspective, brightness gradients for light and shade, movement parallax, binocular parallax, and accommodation and convergence all show the same relationship. The same curve of retinal distance accounts for all of the cues to depth perception.—*B. S. Aaronson*.

4189. Senders, John W., & Senders, Virginia L. (U. Minnesota) Woodpile revisited: A comment on Gibbins and Howarth's failure to repeat Senders findings. *Quart. J. exp. Psychol.*, 1962, 14(3), 176-177.—(See 37: 4178).

4190. Wallach, Hans, & Moore, Mary E. (Swarthmore Coll.) The role of slant in the perception of shape. *Amer. J. Psychol.*, 1962, 75(2), 289-293.—The traditional explanation of shape constancy assumes that the orientation of an object is registered and its slant relative to the line of sight taken into account. However, there is no empirical evidence that perception actually follows this course. Theories of monocular observation involving cues for slant and assumptions about true shapes tend to be circular explanations. Triangles with a base of 2.5 in. were presented on 2 slopes. Perceived shape of the triangles was represented by a matching procedure. Os used a headrest throughout. In 2 control experiments cues for the slant of a background surface were eliminated. It was demonstrated that good shape-constancy for a figure could be obtained solely from cues to the slant of its background.—*R. D. Nance*.

4191. White, Benjamin W. (Massachusetts Inst. Technology) Stimulus-conditions affecting a recently discovered stereoscopic effect. *Amer. J. Psychol.*, 1962, 75(3), 411-420.—This phenomenon is based on a stimulus display consisting of 2 rectangular dot-matrices similar to those described by Julesz. The effect must depend upon elaborate and precise processing of the images to the 2 eyes. Psychologists have preferred to make the assumption that such perception is based on learning. It is hard to see how a convincing case can be made for past experience here. An account is given of ways in which such displays have been modified and of the degree to which such changes influence the depth effect. Certain questions remain to be answered about this new stereoscopic effect. Can it, for example, be achieved if the elements differ in shape or in color?—*R. D. Nance*.

4192. White, B. W. (Massachusetts Inst. Technology) Effect of temporal ordering on visual recognition. *Percept. mot. Skills*, 1962, 15(1), 75-81.—Ss were asked to view short movies of 3-dimensional nonsense forms and then to identify a still picture of the same form in a new orientation in a set of 4 similar forms. This task proved no more difficult when the movie showed the form moving in a smooth, regular progression, than when the frames of this movie were shown in scrambled order. It is concluded that the stimulus factors making for the perception of smooth, rigid movement are not necessarily the same as those which permit accurate ex-

trapolation from a series in a recognition task.—*W. H. Guertin*.

4193. Wohlwill, Joachim F. (Clark U.) The perspective illusion: Perceived size and distance in fields varying in suggested depth, in children and adults. *J. exp. Psychol.*, 1962, 64(3), 300-310.—"This experiment investigated the effects of different stimulus fields, made up of perspective drawings varying in the amount and regularity of the elements subjected to perspective deformation, on the judgment of relative size and distance in the plane of the drawings. Four age groups, varying from first-grade children to college-age adults, were used as Ss. The results obtained confirmed the prediction that, as the amount and redundancy of information to depth contained in the field increased, the apparent midpoint of a segment of a line through the vanishing point would be displaced towards the top of the field. The results for the size judgments were less consistent. The only age difference appeared on the distance judgments, where adults exhibited smaller effects than children between 7 and 14 yr. of age. The implications of the experiment for an informational approach to the study of space perception are briefly considered."—*J. Arbit*.

4194. Zusne, L., & Michels, K. M. (Purdue U.) More on the geometricity of visual form. *Percept. mot. Skills*, 1962, 15(1), 55-58.—An experiment using 5-sided polygons as stimuli was performed to extend the findings of a previous experiment in which 4-sided polygons were used to establish a tentative definition of "geometric form" and to evaluate the contribution of certain physical form parameters to judged geometricity. The findings of the earlier experiment were confirmed: bilaterally symmetrical and compact figures were judged to be more geometric than asymmetrical and jagged ones. The contribution of 2 other physical form parameters and the implications of the findings for the use of geometric figures in form perception studies are discussed.—*W. H. Guertin*.

Color Vision

4195. Helm, Carl E., & Tucker, Ledyard R. (Princeton U.) Individual differences in the structure of color-perception. *Amer. J. Psychol.*, 1962, 75(3), 437-444.—Torgerson's multidimensional-triad ratio-scaling procedure was utilized to determine similarity scale values of pairs of color chips for normal and color-deficient Ss. Scale values were arranged as a matrix with rows for values and columns for Ss. Cross-product factoring yielded a 3-dimensional structure with normal Ss in one plane and color-deficient Ss in another.—*R. D. Nance*.

4196. Lightfoot, Charles. (U. Illinois) Contextual influence upon the perception of color. *Amer. J. Psychol.*, 1962, 75(3), 503-504.—Materials necessary are a sheet of blue-ruled yellow paper, a sheet of plain white paper, and a white light source. When the white sheet is properly laid on the yellow one, the 2nd blue line appears green while the top one remains blue. The adjacent yellow appears more saturated. If the white sheet is moved slowly downward, the effect is heightened.—*R. D. Nance*.

4197. Miller, Kliem R. Absolute identification of Munsell hues under red illumination. *HumRROR res. Memo.*, 1961, Subtask Armornite IX, Task 11-27.

ii, 6 p.—Of 9 identifiable surface colors, 4 are usable "together for coding under red light when absolute identification is required." There may be "3 groups of 4 colors each."—*R. Tyson.*

4198. Sirkar, Arun K. Quantitative mental estimation of various colors. *Psychol. Stud., Mysore*, 1962, 7(2), 1-5.—Experiments on students in determining the percentage for green, blue, and yellow colors in mixtures showed that "in quantitative estimation of the colors no rigid formulation is possible."—*U. Pareek.*

Visual Sensitivity

4199. Beck, Jacob. (U. Pennsylvania) Supplementary report: An examination of an aspect of the Gelb effect. *J. exp. Psychol.*, 1962, 64(2), 199-200.—Previous studies showed that the judgment of illumination of a visual field consisting of discriminable areas of differing but uniform luminance is strongly influenced by the luminance of the highest reflecting area. The present experiment tests this hypothesis by obtaining judgments of lightness and illumination in a situation similar to that of Gelb's. The hypothesis was supported.—*J. Arbitt.*

4200. Lipkin, B. S. (Columbia U.) Monocular flicker discrimination as a function of the luminance and area of contralateral steady light: I. Luminance. *J. Opt. Soc. Amer.*, 1962, 52(11), 1287-1295.—It is hypothesized that a steady light in one eye will lower or inhibit the critical rate (CFF) of contralateral intermittent flashes of light in a manner consonant with the effect of an adapting field on the discrimination of single flashes. Luminances spanning a 6-log-unit range were variously combined in 2 1.5° fields. Results indicate that there is an inhibitory effect which depends in part on relative luminances: except with very dim stimuli, an adapting light dimmer than a given flicker light reduces CFF somewhat; and CFF decreases progressively as adapting luminance increases. Viewed with bright adapting light, a moderately bright flicker field shows a 10%-20% reduction in CFF and a dim flicker light (whose CFF is 8 cps or less) shows a 100% reduction in CFF. However, the data, when plotted in a $\Delta I/I$ format, shows only partial similarity to curves of steady-field and single-flash luminance discrimination. Moreover, the upper limb in each of the family of binocular CFF-log I curves, in which adapting luminance is the parameter, parallels the monocular curve, and may be fitted to a similar exponential equation.—*Journal abstract.*

4201. Lipkin, B. S. (Columbia U.) Monocular flicker discrimination as a function of the luminance and area of contralateral steady light: II. Area. *J. Opt. Soc. Amer.*, 1962, 52(11), 1296-1300.—The relation between field size and decrease in critical rate (CFF) of a flickering field stereoscopically superimposed on a contralateral steady image is reported. 2 designs were used. In one, luminances spanning a 6-log-unit range were variously combined in fields which were both 1.5°, 3°, or 9°, or in which the flickering field was the smaller image. The other design utilized the same luminance combinations but the flickering image was 6° and the adapting field was varied from 9° to 1.5°. Results indicate that if both fields are initially 1.5° then increasing the size of both fields or of just the adapting field does not further decrease CFF. But if the size of the flicker-

ing field is increased to 6°, CFF of the 1.5° central portion of the flicker field which appears superimposed on the 1.5° adapting field is markedly reduced, while the flickering annulus shows the threshold reduction expected with equal-sized 6° fields. The center of a fairly bright 6° flicker field viewed with an adapting field 4.5° or less and flashing at low frequencies appears steady. Several interpretations of the results (macular dominance, corresponding points, monocular cross-regional interaction) are discussed.—*Journal abstract.*

4202. Matin, L. (Columbia U.) Binocular summation at the absolute threshold of peripheral vision. *J. Opt. Soc. Amer.*, 1962, 52(11), 1276-1286.—Binocular probability of seeing, $P(B)$, was measured as a function of the time between onsets of 2-msec., 35-min. visual angle flashes to corresponding locations 7° horizontally displaced from the foveas of both eyes of dark-adapted Ss. $P(B)$ was greater than the value that would be predicted if the 2 eyes were independent detectors [$P'(B)$] for interstimulus intervals below 100 msec. 2 peak values of $P(B)$ were observed, one occurring close to zero and the other close to 90 msec. $P(B)$ and $P'(B)$ were indistinguishable for interstimulus intervals above 100 msec. It is concluded that the largest barrier to seeing at threshold lies in a pathway common to the 2 eyes.—*Journal abstract.*

4203. Raab, David H., & Osman, Eli. (Brooklyn Coll.) Effect of temporal overlap on brightness matching of adjacent flashes. *J. Opt. Soc. Amer.*, 1962, 52(10), 1174-1178.—Flashes having durations of 10, 20, 50, and 100 msec. were matched in brightness to an adjacent 200-msec. standard. When the standard and test stimuli terminated together, the results confirmed earlier demonstrations of the Broca-Sulzer phenomenon. Different functions relating the growth of brightness to duration were generated, however, when the flashes matched to each other had coincident onsets or coincident middurations. The matches made with stimuli terminating together were shown to exhibit transitivity: Targets which are as bright as a standard are approximately as bright as each other. Finally, an effect of relative luminance on apparent temporal position is described.—*Journal abstract.*

4204. Spigel, I. M., & Hamilton, H. C. (U. Pittsburgh School Medicine) A pre-exposure vector in CFF surround brightness. *Percept. mot. Skills*, 1962, 15(1), 142.—The purpose of the present experiment was to determine the effects of pre-fixation on a solid I-figure on binocular foveal CFF (critical flicker fusion). The mean CFF for the 12 Ss in the absence of prior fixation on the I-figure was 29.1 cps. The postfixation mean CFF was 30.6 cps. The t ratio of 3.8 for the 1.5 cps difference was significant at less than the .01 level. One reason for the difference in the unexpected direction could involve a phenomenally brighter surround and target which may have resulted from a negative afterimage that followed fixation of the solid I-figure.—*W. H. Guertin.*

Eye Movements

4205. Crovitz, Herbert F., & Daves, Walter. (VA Hosp., Durham, N. C.) Tendencies to eye movement and perceptual accuracy. *J. exp. Psychol.*, 1962, 63(5), 495-498.—"The direction of initial

postexposure eye movements was studied in a tachistoscopic situation in which a row of numerals appeared across the visual field and no eye movement occurred until the cessation of stimulation. A congruence was found between the direction of the initial eye movement and the side of the visual field more accurately perceived. This finding supports the hypothesis that differential tendencies to eye movement are associated with differential accuracy. A secondary finding was that, in monocular viewing, there were more eye movements to the side of the viewing eye."—*J. Arbit.*

4206. Shakhnovich, A. R., & Shakhnovich, V. R. Fotoskaniruiushchii polioikulograf. [Photoscanning polyoculograph.] *Biofizika*, 1962, 7(4), 473-474.—An apparatus is described for registering both the horizontal and vertical components of eye-movements and the vertical diameter of the pupil.—*I. D. London.*

4207. Stiefel, Joseph W., & Smith, J. Lawton. (Duke U. Hosp.) Vertical optokinetic nystagmus: The normal response. *Neurology*, 1962, 12(4), 245-249.—The authors feel that the abnormalities in the vertical response are likely to have diagnostic significance and they report the results of an electro-oculographic study of the vertical optokinetic responses in normal individuals in order to shed light on this problem. 20 normal Ss were examined and the authors conclude "the vertical responses were found to be nearly symmetrical with only minor variations."—*R. Gunter.*

CHEMICAL SENSES

4208. Gregson, R. A. M. (J. Lyons & Co., Ltd., London, England) A rating-scale method for determining absolute taste thresholds. *J. food Sci.*, 1962, 27, 376-380.—"Absolute taste thresholds for salt and sweetness were determined by a combination of ascending-series and rating-scale methods: for salt a value only very slightly under previous quoted figures was obtained, for sugar a value of .002 p/p was obtained." Results permitted scaling of each description on the 7-point scale in terms of both just-noticeable-differences above threshold and solution concentration, suggesting the possibility of operationally defining a number of thresholds in an ascending series.—*D. R. Peryam.*

4209. Pangborn, Rose Marie. (U. California, Davis) Taste interrelationships: III. Supra-threshold solutions of sucrose and sodium chloride. *J. food Sci.*, 1962, 27, 495-500.—10 highly trained Ss tested the effect of 4 concentrations of sodium chloride on the sweetness of 4 concentrations of sucrose in distilled water, and the effect of sucrose on saltiness using the same design but different concentrations. Both single stimulus and paired comparison methods were used. The apparent saltiness of higher levels (0.36-3.24%) of salt was reduced by sucrose. The apparent sweetness of lower levels (0.75-6.75%) of sucrose was increased by lower, and reduced by higher, salt additions. All salt levels depressed the sweetness of 20.25% sucrose. There was large variation in scoring attributable to differences between Ss, but reproducibility of judgment was much better for the paired than for single stimulus method.—*D. R. Peryam.*

4210. Stone, H., Ough, C. S., & Pangborn, R. M. (U. California, Davis) Determination of odor dif-

ference thresholds. *J. food Sci.*, 1962, 27, 197-202.—The olfactometer is described. It operates by diluting odorant-saturated air into a controlled airflow at constant temperature and humidity. Measurement was found to be rapid and reproducible. Thresholds were established at 4 levels of 2-heptanone by the constant stimulus method using 48 Ss. Weber's law was confirmed with a Weber fraction of 0.23 mg/min/deviate. The absolute threshold was 8.97×10^{-4} mg. per liter of air.—*D. R. Peryam.*

SOMESTHESIS

4211. Chkhaidze, L. V. (Georgian Inst. Physical Culture, Tbilisi, USSR) Vlianie izmeneniĭ gravitatsionnogo polia na koordinatsiiu proizvol'nykh dvizhenii cheloveka. [Influence of changes in the gravitational field on the coordination of voluntary movements in man.] *Soobshch. Akad. Nauk Grus. SSR*, 1962, 28(5), 593-600.—The coordination of voluntary movements (strength of 2 sequential and differentiated finger-pressings) is expected to be disturbed with increase of the gravitational field. The limits of disturbance depend on the state and training of the S and are proportional to the logarithm of acceleration of the gravitational force. Systematic practice of the disturbed motor habit in the gravitational field leads to its reestablishment. The reestablishment is a function of the state and training of the S, the magnitude of gravitation, and at separate periods of time is proportional to the logarithm of the time for executing the movements, provided the gravitational field does not progressively increase and the movements are executed with constant frequency. It is felt that a similar situation would prevail in a field of zero-gravity.—*I. D. London.*

4212. Egorov, A. S., & Zakhariants, I. U. S. (Inst. Physical Culture, Leningrad, USSR) Elektrofiziologicheskie issledovaniia kinestezicheskogo analizatora. Soobshchenie I. Prostranstvennye komponenty dvizheniia. [Electrophysiological investigation of the kinesthetic analyzer. Communication I. Spatial components of movement.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 6, 89-92.—10 Ss were instructed to evaluate by means of kinesthetic stimulation only, the amplitude of the arm moving up and down at the elbow joint. The amplitude, the EMG, and the "mechanograms" were recorded. The movement took place under different conditions (passive and active movements, with or without control). The basic task consisted in reproducing the amplitude of a certain standard. Among the findings are: (a) in active and controlled movements there is a greater expenditure of electric energy than in passive and uncontrolled movements and (b) the kinesthetic analysis consists in "singling out of the stream of muscular stimulations of certain moments corresponding to the location of the arm in space."—*A. Cuk.*

4213. Eisler, Hannes. (Harvard U.) Subjective scale of force for a large muscle group. *J. exp. Psychol.*, 1962, 64(3), 253-257.—"The subjective force of pushing a pedal with the leg has been scaled as an instance of the subjective force exerted by a large muscle group. The following methods were employed: magnitude estimation, magnitude production, matching the force of handgrip to the force of foot pressure and vice versa, and matching both foot pressure and handgrip to the intensity of white noise.

The experiments involving numbers yielded a power function with an exponent of 1.6 relating subjective force to physical force. All the matching experiments showed that the exponent for force of foot pressure and force of handgrip is the same. The exponent for handgrip has previously been determined as 1.7.—*J. Arbit.*

Amer.*, 1962, 34(8), 1096-1099.—"The Huggins creation of pitch stimulus is regarded as a binaural masking stimulus and the equalization and cancellation model of binaural masking level differences is applied to the creation of pitch phenomena."—*A. M. Small, Jr.*

4224. Groen, J. J. (Utrecht State U., Netherlands) **Inhibitory mechanism of the vestibular system in man in comparison with hearing.** *J. Acoust. Soc. Amer.*, 1962, 34(9 Pt. II), 1497-1503.—"Adaptation in the organs of hearing and equilibrium is compared. The latter is demonstrated in normal individuals under different circumstances, appearing in the form of inhibition of vertigo and nystagmus. Apparently, the adapted state persists longer in the

vestibular system than in hearing. The growing influence of the vestibular inhibitory efferent system in man is demonstrated in a newborn infant." (20 ref.)—A. M. Small, Jr.

4225. Hood, J. D. (National Hosp., London, England) **Bone conduction: A review of the present position with especial reference to the contributions of Dr. Georg von Békésy.** *J. Acoust. Soc. Amer.*, 1962, 34(9 Pt. II), 1325-1332.—"The very great advances in our knowledge of bone conduction have been made by Békésy's fundamental investigations are outlined and considered in relationship to the influence they have brought to bear upon the investigations of later workers in this field. The topics considered include the mode of vibration of the skull, the theoretical mechanisms of bone conduction, the so-called occlusion effect, bone conduction in a free sound field, and the interaural attenuation across the head." (46 ref.)—A. M. Small, Jr.

4226. Jeffress, Lloyd A., & Robinson, Donald E. (U. Texas) **Formulas for the coefficient of interaural correlation for noise.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1658-1659.—Formulas for the coefficients of interaural correlation for noise are derived for the case where there are 3 similar sources, 1 for 1 ear, 1 for the other, and 1 for both; and for the case where there are 2 sources, 1 for 1 ear and 1 for both. Some confusion in the literature between these 2 formulas is described.—A. M. Small, Jr.

4227. Ritsma, R. J. (Inst. Perceptie Onderzoek, Eindhoven, Netherlands) **Existence region of the tonal residue. Part I.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. I), 1224-1229.—The literature shows that attempts to establish the residue have not always been successful, mostly due to the specific frequency combinations chosen. In this paper, measurements are described on an harmonic complex consisting of 3 components, with variable modulation depth and frequency. This harmonic complex is found to have a decidedly tonal character within a limited frequency region. The boundaries for a complex with a modulation depth of 100% are roughly given by values of the center frequency $f < 5000$ cps, and values of the spacing frequency $g \geq 0.05f$. A theoretical model of a pitch-extractor is presented which accounts for the observed frequency region of the tonal residue.—A. M. Small, Jr.

4228. Rosenzweig, Mark R. **Auditory localization.** *Scient. American*, 1961, 205(4), 132-146.—Starting at each ear and leading to the cerebral cortex is a chain of neurons. There are several stations along the chain where some neurons end and others begin. At all but the very lowest of these stations the pathways from the 2 ears overlap to some extent. Neural impulses from 1 ear consequently have an increasing probability of encountering impulses from the other as they approach the cortex. The converging impulses make some groups of nerve cells become more active and others less so. The resulting different patterns of activity in the auditory cortex are correlated with different locations of auditory stimuli.—L. A. Waack.

4229. Schouten, J. F., Ritsma, R. J., & Cardozo, B. Lopes. (Inst. Perceptie Onderzoek, Eindhoven, Netherlands) **Pitch of the residue.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1418-1424.—The residue is defined as the joint perception as a specific pitch

of a number of Fourier components. The consequences of this phenomenon for the theory of hearing are briefly reviewed in the light of past experiments. Special attention is then called to what are termed the 1st and 2nd effects of pitch shift. The 1st effect is found when equidistantly shifting the entire Fourier spectrum. The 2nd effect shows itself primarily in a slight drop in pitch when increasing the frequency spacing of the Fourier components. Both these phenomena strongly point towards a pitch-extracting mechanism different from and subsequent to the basilar membrane and operating in the time domain.—A. M. Small, Jr.

4230. Thiessen, G. J., & Subbarao, K. (National Research Council, Ottawa, Canada) **Effect of reverberation on assessment of repetitive impulse noise.** *J. Acoust. Soc. Amer.*, 1962, 34(11), 1761-1763.—Reverberation is found to decrease the acceptability of impulse noise even though directional effects resulting from head diffraction are eliminated by presenting the signals by means of earphones. 4 clicks per sec., with artificially added reverberation corresponding to $\tau = 1.1$ sec., were presented to the Ss who could adjust the level until it matched the same signal without reverberation. Matching was done according to "annoyance," "noisiness," and "speech interference." Reverberation had no appreciable effect when the reference signal was of low level. The maximum effect occurred in the 85- to 90-db. sound pressure level region where it was equivalent to about 3, 4, and 8 db, respectively, for the 3 criteria.—A. M. Small, Jr.

4231. Tonndorf, Juergen. (U. Iowa) **Compressional bone conduction in cochlear models.** *J. Acoust. Soc. Amer.*, 1962, 34(8), 1127-1131.—Animal experiments suggest the possibility that the compressional mode of bone conduction might produce a displacement of the cochlear partition, even when the cochlear windows and all other potential pressure outlets are closed. This assumption was found correct for the case of a cochlear model. It executed so-called "distortional" vibrations, i.e., while its walls in one place moved inward, those in the other moved outward and vice versa.—A. M. Small, Jr.

4232. Tonndorf, Juergen. (U. Iowa) **Time/frequency analysis along the partition of cochlear models: A modified place concept.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1337-1350.—Cochlear analysis of an applied signal is considered to be given by the distribution of amplitudes along the partition. This form of resolution has been thought to correspond to the result of a straightforward Fourier analysis. The present paper attempts to show that cochlear models of the Békésy-type do not perform in this manner. Along the existing time/frequency continuum, the response to sinusoidal signals represents one extreme, approaching a pure Fourier (frequency) analysis, and the response to transients the other extreme, approaching a pure time (waveform) analysis. Responses to all other signals arrange themselves between those 2 extremes; i.e., the resolution depends upon spectral as well as temporal features of the applied signal. (30 ref.)—A. M. Small, Jr.

4233. Ushakova, T. N. (Inst. Psychology, RSFSR Acad. Pedagogical Sciences) **Vliianie slovesnoi sistemy na slukhuvoi analizator cheloveka.** [Affect of verbal system on the auditory analyzer of man.]

Dokl. Akad. Pedagog. Nauk RSFSR, 1961, No. 6, 77-80.—Ss (data on Ss very defective) were asked to discriminate first verbally and then by pressing a key between 4 tones of the same loudness. The tones were 1046, 1245, 1480 and 1760 cycles. The task consisted of discriminating the 1245 cycle tone from the others. The motor reaction time was recorded under the following conditions: positive (when the 2nd tone was the same as the standard), negative (when the 2nd tone was different but 1 of the 3 constant stimuli), indifferent (when the 2nd tone was different and extraneous). The results showed a strong effect of the positive and inhibitory stimuli on the analyzer. This effect seemed to be a function of the musical training and ability of the Ss.—*A. Cuk.*

4234. *van Bergeijk, William A.* (Bell Telephone Lab., Murray Hill, N. J.) **Variation on a theme of Békésy: A model of binaural interaction.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. 11), 1431-1437.—The model of binaural interaction proposed by Békésy is reexamined in the light of recent anatomical and physiological findings. A modified model is proposed in which time and intensity are mapped independently in the accessory nuclei of the superior olive; excitatory and inhibitory neural signals interact at the accessory nucleus neurons, giving rise to a time-intensity trade. The behavior of the model is in qualitative accord with psychophysical and physiological observations. (16 ref.)—*A. M. Small, Jr.*

4235. *Ward, W. Dixon.* (Subcommittee on noise, 327 S. Alvarado, Los Angeles) **Damage-risk criteria for line spectra.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1610-1619.—It is demonstrated that the differences in temporary threshold shift (TTS) producing ability of tones and noises can be attributed mainly to their differences in ability to arouse the acoustic reflex; since noises cause more sustained contraction of the middle-ear muscles than do pure tones, less TTS will usually be produced by noise. Because this difference in contraction, and hence in effective attenuation, is a variable function of frequency, intensity, and time, no one single decibel correction factor is appropriate. It is suggested that damage-risk criteria for pure tones should be developed empirically by measuring TTS directly rather than by attempting to modify existing criteria for octave-band noise.—*A. M. Small, Jr.*

4236. *Ward, W. Dixon.* (Subcommittee on Noise, Los Angeles, Calif.) **Studies on the aural reflex: III. Reflex latency as inferred from reduction of temporary threshold shift from impulses.** *J. Acoust. Soc. Amer.*, 1962, 34(8), 1132-1137.—The effective protection provided by arousal of the acoustic reflex against temporary threshold shift (TTS) at 4 kc from exposure to impulse noise was studied by comparing the rate of growth of TTS produced by 2-min. exposures to clicks of successively higher peak levels. 2 conditions were used: (a) clicks heard alone, and (b) each click preceded at various intervals from 25 to 150 msec. by a 1000-cps 100 db pure tone presented to the contralateral ear. The results imply that the effective attenuation amounts to 1 db. at 25 msec., 5 db. at 62 msec., and 13 db. at 100 msec. Individual differences were large; some of the most slowly responding ears did not show significant protection until the delay reached 150 msec.—*A. M. Small, Jr.*

4237. *Wever, Ernest Glen.* (Princeton U.) **Development of traveling-wave theories.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1319-1324.—"The traveling-wave theories are traced historically from their earliest formulation to modern times. Special consideration is given to the weighty influence on the later developments of these theories exerted by Békésy's direct visual observations of the movements of cochlear structures in response to sounds. Finally, a résumé is given of the characteristics of the tonal patterns and their dependence upon the physical variables operating within the cochlea, according to Békésy's experiments on mechanical models and specimens of human and animal ears. Hereby are brought into focus the many conditions that a final theory of hearing must meet."—*A. M. Small, Jr.*

Measurement

4238. *Butler, R. A., & Naunton, R. F.* (U. Chicago) **Some effects of unilateral masking upon the localization of sound in space.** *J. Acoust. Soc. Amer.*, 1962, 34(8), 1100-1107.—Ss were asked to locate various puretone and complex-sound signals delivered by a concealed loudspeaker while puretone or complex masking stimuli were delivered to one ear by means of a single headphone. The results indicate that masking can have a strong and consistent effect in pulling the apparent source of the free-field signal toward the masked ear. The effect is striking when the frequency spectrum of the mask covers that of the free-field signal; the effect may still be evident, however, when signals and mask have no frequency components in common.—*A. M. Small, Jr.*

4239. *Craig, James H., & Jeffress, Lloyd A.* (U. Texas) **Effect of phase on the quality of a two-component tone.** *J. Acoust. Soc. Amer.*, 1962, 34(11), 1752-1760.—Ss' responses to monaurally presented 2-component stimuli (a 250-cps tone and its octave at various intensities and phase relations) reveal striking individual differences and unexpected patterns. When the intensity of 1 of the stimulus components and the phase angle between the components are held constant, reversals of phase of the entire stimulus become discriminable as soon as the intensity of the 2nd component is increased a little above threshold. With certain combinations, as the 2nd component is further increased, phase discrimination for one S reaches a maximum, decreases to chance, and then increases again. For another S under the same set of conditions, phase discrimination does not fail, but rather, monotonically increases. (31 ref.)—*A. M. Small, Jr.*

4240. *Elliott, L. L.* **Backward masking: Monotic and dichotic conditions.** *USAF Sam Rep.*, 1962, No. 62-76. 14 p.—White noise was used as a masking signal and a 1000-cps tone as a masked signal. In forward masking the masked signal followed masking signal in time. In backward masking these relations were reversed. For monotic conditions masking stimuli as well as the masked signal were presented to the right ear. For dichotic conditions masking was presented to the left ear and masked signal to the right ear. 8 Ss were used. Results indicate that monotic backward masking occurs over time intervals up to 50 msec., while for the dichotic condition, backward masking occurs for intervals as long as 15 msec. Less monotic forward

masking is obtained for brief masking intervals, and very little dichotic forward masking is observed.—*M. C. Payne, Jr.*

4241. Elliott, Lois L. (Brooks AFB, Tex.) Backward and forward masking of probe tones of different frequency. *J. Acoust. Soc. Amer.*, 1962, 34(8), 1116-1117.—Backward and forward masking produced by noise on 500-, 1000-, and 4000-cps probe tones were explored under monotonic and dichotic listening conditions. Effect of probe frequency was found to vary with duration of the masking interval.—*A. M. Small, Jr.*

4242. Elliott, Lois L. (Brooks AFB, Tex.) Backward masking: Monotonic and dichotic conditions. *J. Acoust. Soc. Amer.*, 1962, 34(8), 1108-1115.—"Backward masking" denotes the situation in which a stimulus is masked by another stimulus which follows it in time while "forward masking" is the temporal converse. In this study, backward and forward masking were investigated for both monotonic and dichotic conditions using white noise as the masking signal, and a 1000-cps probe signal. Results indicate that monotonic backward masking occurs over intervals up to 50 msec. while, for the dichotic condition, backward masking occurs for intervals as long as 15 msec. Less monotonic forward masking is obtained for brief masking intervals and very little dichotic forward masking is observed.—*A. M. Small, Jr.*

4243. Green, David M., & Sewell, Susan T. (Massachusetts Inst. Technology) Effects of background noise on auditory detection of noise bursts. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. I), 1207-1216.—The ability of Ss to detect signals that are bursts of white noise is measured by 2 procedures. In both procedures the S's task is to select the interval containing the signal from the 2 temporal intervals, marked by lights, which constitute a trial. In the 1st, the signal is added to a continuous background of white noise; in the 2nd, the signal is added to one or the other of 2 equal noise bursts, that are added to the continuous background noise during the observation intervals. In the 1st experimental condition the results are consistent with the assumption that S is uncertain about either the exact time when the signal occurs or its exact duration, or about both. In the 2nd procedure the psychometric functions are consistent with the prediction of a statistical-decision model that assumes exact knowledge of the temporal occurrence of the signal.—*A. M. Small, Jr.*

4244. Ham, Lloyd B., Biggs, Frank, & Cathey, Everett H., Jr. (U. Arkansas) Fractional and multiple judgments of loudness. *J. Acoust. Soc. Amer.*, 1962, 34(8), 1118-1121.—Data based on over 2000 Ss gathered during the last 26 years on loudness estimates obtained with pure tones ranging from 0.06 to 10 kcps are presented. They indicate that fraction judgments require a smaller decibel change of intensity than the corresponding multiple loudness estimates.—*A. M. Small, Jr.*

4245. Hirsh, Ira J. (Central Inst. Deaf, St. Louis) Békésy's audiometer. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1333-1336.—The audiometer that Békésy described in 1947 has permitted the measurement of auditory thresholds as a continuous function of frequency or of time, and simultaneously provided a measure of the S's variability. The clinical value of the instrument lies in part in the detailed

frequency characteristics of the threshold. In the laboratory, the principles of the audiometer have been incorporated in ways that have permitted new kinds of problems to be studied. Particular reference is made to masked audiograms as a function of frequency and continuous recovery curves after exposure to sound. (34 ref.)—*A. M. Small, Jr.*

4246. Jeffress, Lloyd A., & Blodgett, Hugh C. (U. Texas) Effect of switching earphone channels upon the precision of centering. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. I), 1275-1276.—The precision of centering a noise signal in the head is improved by switching the earphone channels; either by commutating them, or by switching from a single channel for both ears to 1 channel for one ear and 1 for the other. Switching reduces both random and bias errors.—*A. M. Small, Jr.*

4247. Jeffress, Lloyd A., Blodgett, Hugh C., & Deatherage, Bruce H. (U. Texas) Effect of interaural correlation on the precision of centering a noise. *J. Acoust. Soc. Amer.*, 1962, 34(8), 1122-1123.—"Ss were asked to center a noise presented via earphones, by adjusting a delay line controlling interaural time differences. Various noise correlations were employed ranging from 1.00 to 0.10. Even in the latter case, which represents a signal to noise difference of -9.5 db the Ss were able to perform well above a chance level."—*A. M. Small, Jr.*

4248. Jeffress, Lloyd A., Blodgett, Hugh C., & Deatherage, Bruce H. (U. Texas) Masking and interaural phase: II. 167 cycles. *J. Acoust. Soc. Amer.*, 1962, 34(8), 1124-1126.—"Masking level differences obtained for 167 cps are presented. Some involved shifting the phase of the signal through various angles, and other, shifting the noise in interaural time. Where the experimental conditions are comparable to Hirsh's (see 22: 4799) at 200 cps, the data agree very closely with his. The data obtained with various interaural time differences in the noise are shown to differ sharply from comparable data taken at 500 cps."—*A. M. Small, Jr.*

4249. Loeb, M., & Hawkes, G. R. (USA Medical Research Lab., Fort Knox, Ky.) Auditory intensity discrimination as a function of stimulus presentation method. *USA Med. Res. Lab. Rep.*, 1962, No. 542. ii, 13 p.—Relative differential intensive limens were obtained at 3 frequencies and 2 intensities for 3 stimulus patterns involving fluctuation of a steady tone and 3 patterns involving separate stimuli. The same observers were utilized in all cases; in Experiment I, signals were presented through earphones. Somewhat lower thresholds were obtained for fluctuating intensity patterns than for separate stimuli patterns, thresholds tended to be lower at the higher intensity level, and thresholds were lower for patterns allowing greater opportunity for comparison within the patterns. When similar thresholds were obtained for patterns presented through speakers (Experiment II), thresholds were smaller, the influence of intensity was smaller, and the influence of (presentation) pattern type was less consistent. Significance of the findings is discussed.—*USA MRL.*

4250. Loeb, Michel, & Hawkes, Glenn R. (USA Medical Research Lab., Fort Knox) Auditory intensity discrimination as a function of stimulus presentation method. *J. Acoust. Soc. Amer.*, 1962, 34(10), 1643-1647.—Relative differential intensive

limens were obtained at 3 frequencies and 2 intensities for 3 stimulus patterns involving fluctuation of a steady tone and 3 patterns involving separate stimuli. Somewhat lower thresholds were obtained for fluctuating intensity patterns than for separate stimuli patterns, thresholds tended to be lower at the higher intensity level, and thresholds were lower for patterns allowing greater opportunity for comparison within the patterns. When similar thresholds were obtained for patterns presented rather than earphones, thresholds were smaller, the influence of intensity was smaller, and the influence of (presentation) pattern type was less consistent.—*A. M. Small, Jr.*

4251. Raab, David H., & Osman, Eli. (Brooklyn Coll.) **Effect of masking noise on lateralization and loudness of clicks.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1620-1624.—The effects of monaural masking noise on loudness and on lateralization of clicks were compared for noise levels ranging between 35 and 65 db. sound pressure level. For different fixed levels of unmasked clicks, sound-pressure levels of the masked clicks were adjusted by the Ss to produce centered sound images. In a 2nd experiment, similar procedures were used to generate equal-loudness functions. For both loudness and lateralization, the effect of masking noise was greatest with high levels of noise and low intensities of click. In every case, the masking effect was greater for loudness than for lateralization.—*A. M. Small, Jr.*

4252. Raab, David H., & Osman, Eli. (Brooklyn Coll.) **Magnitude estimation of the loudness of clicks.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1658.—“Numerical estimations of the loudness of click stimuli were found to be a power function of sound pressure. The exponent (0.49) of the function is smaller than those previously reported in studies utilizing sustained tones or noises.”—*A. M. Small, Jr.*

4253. Riach, W., Elliott, D. N., & Reed, James, C. (Wayne State U.) **Growth of loudness and its relationship to intensity discrimination under various levels of auditory fatigue.** *J. Acoust. Soc. Amer.*, 1962, 34(11), 1764-1767.—Loudness growth as determined by the method of magnitude estimation and intensive differential thresholds were determined under normal conditions and under 3 levels of fatigue. Loudness growth differed from normal under all fatigue conditions and increased its rate as fatigue increased. While the intensive differential thresholds also differed from normal under all fatigue conditions there was no change in threshold as severity of fatigue increased.—*A. M. Small, Jr.*

4254. Sergeant, Russell L., & Harris, J. Donald. (USN Medical Research Lab., Groton, Conn.) **Sensitivity to unidirectional frequency modulation.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1625-1628.—Responses to a unidirectional frequency shift at 1500 cps at a 50-phon level using trained and untrained listeners are analyzed. A constant of a 5 cps change emerges indicating that sensitivity depends on a linear relationship between rate of change and stimulus duration. This constant is of the same order of magnitude as the traditional DL for pitch memory.—*A. M. Small, Jr.*

4255. Small, Arnold M., Jr., & Campbell, Richard A. (U. Iowa) **Temporal differential sensitivity for auditory stimuli.** *Amer. J. Psychol.*, 1962, 75(3), 401-410.—Using the method of constant stim-

ulus-differences, the study sought information regarding discrimination of auditorily presented temporal intervals for short durations. Inter-stimulus intervals and frequency were varied. 47 students of introductory psychology were used as Os. Temporal discrimination deteriorated with reduced duration. Discrimination was also poorer with shorter inter-stimulus intervals; however, inter-stimulus interval lost its influence with longer durations. Stimulus-frequency seemed important only at the shortest durations. Hypotheses that either loudness or a clock-mechanism is a primary determinant of temporal discrimination do not adequately explain the present data.—*R. D. Nance.*

4256. Stevens, S. S., & Guirao, Miguelina. (Harvard U.) **Loudness, reciprocity, and partition scales.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1466-1471.—“By the methods of magnitude estimation and magnitude production, judgments of softness were shown to be the reciprocal of judgments of loudness. The instruction to judge ‘distance’ produces the same results as instructions to judge softness. Attempts to partition a segment of the loudness continuum into equal-appearing intervals results in a systematic error that is greater the more variable are the judgments.”—*A. M. Small, Jr.*

4257. Teas, Donald C. (Central Inst. Deaf, St. Louis) **Lateralization of acoustic transients.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1460-1465.—The lateral position of the intracranial image resulting from acoustic transients presented via earphones is shown to vary with frequency content and sensation level (SL) as well as with interaural time differences. The data suggest that an anatomical substrate for a “timing signal,” if present at all in the auditory system, does not have its origin in the inner ear. The theoretical treatment suggests that the synchrony of the neural input may be a significant factor in localization.—*A. M. Small, Jr.*

4258. Ward, W. Dixon. (Subcommittee on Noise, 327 S. Alvarado, Los Angeles) **Effect of temporal spacing on temporary threshold shift from impulses.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. I), 1230-1232.—13 normal-hearing Ss were exposed to 60 high-intensity pulses presented at 4 different inter-pulse intervals. Results indicate that the temporary threshold shift (TTS) produced by 1-, 3-, and 9-sec. inter-pulse intervals are essentially equivalent. Less TTS was produced by the 30-sec. interval during the 1st minute of recovery, but by 5 min. after cessation of the pulses, this difference had nearly disappeared. This supports the hypothesis of Hirsh and Bilger that 2 separate fatigue or recovery processes are involved in TTS. It is concluded that total number of impulses is more important than exposure time per se in predicting TTS from impulse noise.—*A. M. Small, Jr.*

4259. Warren, Richard M. (Shimer Coll.) **Are “autophonic” judgments based on loudness?** *Amer. J. Psychol.*, 1962, 75(3), 452-456.—40 normal Os, age 18-40 years, estimated magnitudes of self-generated sounds. 3 different sounds were used. Results suggest that autophonic judgments are loudness-judgments rather than estimates of the “muscular effort” employed in producing the sound.—*R. D. Nance.*

4260. Zwicker, Eberhard. (Technische Hochschule, Stuttgart, Germany) **Direct comparison be-**

tween the sensations produced by frequency modulation and amplitude modulation. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1425-1430.—Comparisons of the sensations produced by frequency- and amplitude-modulated octave-band noises were made by the method of adjustment. The results indicate a general correlation between the sensations produced by the 2 kinds of modulation. "Expressed in changes of level (ΔL) and shifts (Δz) along the critical-band function, ΔL seems to be equal to $C \cdot \Delta z$, where $C = 10$ dB/1.6 Bark [where "Bark" = 1 critical band]." A 2nd experiment shows the possibility of increasing and decreasing the sensation produced by amplitude modulation by adding in-phase or out-of-phase frequency modulation. The conclusion is reached that at least for noises the sensation produced by amplitude changes and that produced by frequency changes are based on the same mechanism.—*A. M. Small, Jr.*

4261. Zwislocki, J., Hellman, R. P., & Verrillo, R. T. (Syracuse U.) Threshold of audibility for short pulses. *J. Acoust. Soc. Amer.*, 1962, 34(10), 1648-1652.—"It is shown that the threshold of audibility for short pulses as a function of the number of pulses, the pulse-repetition rate and the pulse duration, can be accounted for by temporal summation in conjunction with the temporal changes of critical bands and the frequency response of the sound-transmitting system."—*A. M. Small, Jr.*

Speech Perception

4262. Kryter, Karl D. (Bolt Beranek & Newman, Cambridge, Mass.) Methods for the calculation and use of the Articulation Index. *J. Acoust. Soc. Amer.*, 1962, 34(11), 1689-1697.—In an attempt to make unnecessary speech-intelligibility testing, a procedure was developed (see 21: 3438) for calculating from physical and acoustical measurements made on a communication system a measure that is indicative of the intelligibility scores that would be obtained for that system under actual test conditions. This measure is called the "Articulation Index" (AI). Methods of calculating AI have been improved and elaborated to the point where several methods for its calculation, herein reported, can be proposed for use in the evaluation of most speech communication systems. (19 ref.)—*A. M. Small, Jr.*

4263. Kryter, Karl D. (Bolt Beranek & Newman, Cambridge, Mass.) Validation of the Articulation Index. *J. Acoust. Soc. Amer.*, 1962, 34(11), 1698-1702.—Although improvements and modification of the Articulation Index (AI) have been made over the years, it has not been generally accepted, perhaps because of insufficient evidence as to its validity. On the basis of studies reported in the literature and on new studies herein reported, it is shown that AI is a valid predictor of the intelligibility of speech under a wide variety of conditions of noise masking and speech distortion.—*A. M. Small, Jr.*

4264. Kryter, Karl D., Williams, Carl, & Green, David M. (Bolt Beranek & Newman, Cambridge, Mass.) Auditory acuity and the perception of speech. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. I), 1217-1223.—The results of audiometric and speech tests of Ss with normal and different degrees of nerve-type hearing impairment are reported. Correlation regression coefficients were found between the hearing loss measured at a number of pure-tone

frequencies and the speech test results. These indicate that taking the average of the hearing loss at either 2000, 3000, and 4000 cps or at 1000, 2000, and 3000 cps provides a reasonably adequate rank-order indicator of the ability to understand speech. The relation between these results and other studies is discussed; it is suggested that some speech tests and methods of scoring that have been used in experiments of this type in the past introduce a bias that leads to an underestimation of the importance of auditory acuity at frequencies above 2000 cps.—*A. M. Small, Jr.*

4265. Sadler, V. (University Coll., London, England) Effect of succeeding vowel on consonant recognition in noise. *Lang. Speech*, 1961, 4(2), 133-138.—18 Ss were required to identify 23 consonants each presented in CV pairs with each of 5 vowels in white noise at a S/N ratio of 6 db. Overall articulation scores varied with the vowel used, and there was evidence of strong interaction between vowels and consonants. Judgments were also influenced by linguistic frequencies.—*A. E. Horowitz.*

PARAPSYCHOLOGY

4266. Dodds, E. R. Two concordant experiences coinciding with a death. *J. Soc. Psych. Res.*, 1962, 41(Whole No. 713), 337-346.—The author describes a brother's and sister's experiences of premonition in the death of their mother. The sister knew of her mother's serious illness, and on January 31, 1962 had fallen asleep, and awoke at 6:45 P.M. She immediately recited the de profundis (Catholic prayer for the dead), but it was not until the next day that she learned her mother had passed away the night before at 6:40 P.M. The brother likewise had fallen asleep and had awakened also to recite the prayer knowing his mother had died during this same hour. The author attributes this phenomena to ESP, "nothing new in this family."—*O. I. Jacobsen.*

4267. FitzHerbert, Joan. (Child Guidance Clinic, Chatham, Kent, England) Extra-sensory perception in early childhood. *Int. J. Parapsychol.*, 1961, 3(3), 81-91.—Telepathy is offered as a satisfactory explanation for such experiences as "the existence of what appear to be memories of events which occurred in very early life, of inherited memories, of certain apparently innate knowledge, and of the undoubted response of young children to unconscious emotional attitudes in their mothers."—*J. A. Freeman.*

4268. Fodor, Nandor. Sandor Ferenczi's psychic adventures. *Int. J. Parapsychol.*, 1961, 3(3), 49-59.—Recent correspondence with intimate friends, former associates, and the biographer of Ferenczi reveal several personal experiences of a psychic nature. Reference is made to conversations and letters between Ferenczi and Freud on this subject.—*J. A. Freeman.*

4269. Grad, Bernard; Cadoret, Remi J., & Paul, G. I. (McGill U.) An unorthodox method of treatment on wound healing in mice. *Int. J. Parapsychol.*, 1961, 3(2), 5-19.—An attempt to test the effect of the power of a self-styled "healer." 300 mice were randomly divided into 3 equal groups and a 4×8 -inch area of skin removed from each mouse. E (healer) held 1 group of mice (1 to a cage) between his hands for a 15-minute period twice daily. The 2nd group was held by different individuals

each day in the same manner, and the 3rd group was left undisturbed. $\frac{1}{2}$ the cages in each group were placed in paper bags with the top stapled together and $\frac{1}{2}$ in paper bags with tops open. After 16 days the difference in rate of wound healing between E's mice and the 2 other groups was significant at the .01 level (open bags only).—J. A. Freeman.

4270. Slomann, Aage. A projected dictionary of parapsychology. *J. Soc. Psych. Res.*, 1962, 41 (Whole No. 712), 295-299.—Parapsychologists from the different countries should agree on terms in scientific use in parapsychology, and a dictionary covering these terms is needed. At the Utrecht conference a committee was appointed for this purpose but failed, since the English and American leading parapsychologists could not agree on basic terminology. Various examples of terms in a dictionary and encyclopedia are cited as evidence of great difference in defining terms. Readers are requested to voice their opinions on this subject.—O. I. Jacobsen.

4271. Sommer, Robert; Osmond, Humphry, & Pancyr, Lucille. (U. Alberta) Selection of twins for ESP experimentation. *Int. J. Parapsychol.*, 1961, 3(4), 55-69.—The suggestion is made that twins are a class of people who have unusually strong affect and/or special closeness to each other and, because of this, are predisposed to having ESP experiences. In the search for good Ss for ESP experimentation, therefore, twins should be a rewarding source.—J. A. Freeman.

ENVIRONMENTAL EFFECTS

4272. Arnhoff, Franklyn N., & Leon, Henry V. (Miami U.) Sensory deprivation: Its effects on human learning. *Science*, 1962, 138(Whole No. 3543), 899-900.—The rote learning ability of human Ss under conditions of sensory deprivation for 48 hours was compared with results for a control group. The performance of the 2 groups was essentially the same. No significant facilitation or decrement in performance was noted, and in no instance were hallucinations, delusions, or other unusual phenomena reported.—*Journal abstract*.

4273. Frankenhaeuser, M., Sterky, K., & Jaerpe, G. (U. Stockholm, Sweden) Psychophysiological relations in habituation to gravitational stress. *Percept. mot. Skills*, 1962, 15(1), 63-72.—Habituation to gravitational stress was studied in 4 Ss, who received the same treatment in a human centrifuge on 6 separate sessions. The results showed, that at consecutive trials, there was a progressive decrease in adrenaline excretion and in subjective emotional reactions. Furthermore, the intensity of the subjective reaction was almost directly proportional to the amount of adrenoline excretion. Systematic changes in noradrenaline excretion and heart rate were not observed during the course of experiments.—N. H. Guertin.

4274. Goldberger, Leo, & Holt, Robert R. A comparison of isolation effects and their personality correlates in two divergent samples. *USAF ASD tech. Rep.*, 1961, No. 61-417. v, 46 p.—Findings are reported from a pair of replicated studies using male Ss and conditions of perceptual isolation (sensory deprivation) similar to those used in the McGill studies. The 1st group consisted of 14 undergraduates; the 2nd group consisted of 16 unemployed

actors. All Ss were put through an intensive multi-form assessment, which included a battery of objectively scorable tests, plus qualitative data from projective techniques, interview, and autobiography. Reactions to the altered sensory environment, which the Ss experienced for 8 hours, were judged from the typed protocols of their verbalizations during the period of confinement. In all, 14 dependent variables and their syndromes were related to the variables from the personality assessment. First the general group phenomena, then the patterns of correlations are discussed, with the special emphasis on those that were replicated.—*USAF ASD*.

4275. Goldberger, Leo, & Holt, Robert. Studies on the effects of perceptual alteration. *USAF ASD tech. Rep.*, 1961, No. 61-416. iv, 20 p.—This is a report of 3 separate studies which explored facets of sensory alteration (sensory deprivation). One study focussed on the role of a diffuse, homogeneous visual field (Ganzfeld) in promoting visual images; the 2nd compared performance on a cognitive test battery immediately following 8 hours of perceptual isolation with performances under a drug (100 gamma of LSD-25) and a placebo condition; the 3rd study dealt with the effects upon cognitive functioning of an 8-hour isolation experience during which constant auditory vigilance was required of the Ss.—*USAF ASD*.

4276. Grissom, Robert J., Suedfeld, Peter, & Vernon, Jack. (Princeton U.) Memory for verbal material: Effects of sensory deprivation. *Science*, 1962, 138(Whole No. 3538), 429.—Memory retention of a short verbal passage did not change significantly in Ss who were isolated in a dark and soundproof room for 24 hours between the immediate recall test and the terminal recall test. A significant decrease in performance was noted in the control Ss who went about their everyday activities during the 24-hour period after acquisition.—*Journal abstract*.

4277. Guedry, Fred E., Jr., Kennedy, Robert S., Harris, Charles S., & Graybiel, Ashton. Human performance during two weeks in a room rotating at three RPM. *USN Sch. Aviat. Med. NASA jr. res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 74; NASA Order R-47. 26 p.—4 men were tested before, during, and after being rotated at 3 RPM for 2 weeks in the Pensacola Slow Rotation Room. The men also lived in the room preceding the commencement of the rotation. Tests of intellectual and physiological function were included. The principal finding was that no serious psychological or physiological deficit was detected during 2 weeks of rotation or during the subsequent readaptation to normal environment. The only test showing pronounced deterioration of performance at the beginning of rotation and upon returning to normal environment was the Graybiel-Fregly Posture Test. This means that any task requiring ordinarily difficult locomotion would be disturbed at these critical intervals. Ordinary walking with adequate visual reference was not so obviously affected. Results are discussed in relation to: problems of rotating space stations, the vestibular system, and experiments involving optically distorted visual information. (30 ref.)—*USN SAM & NASA*.

4278. Hixson, W. Carroll, & Niven, Jorma I. Frequency response of the human semicircular

canals: II. Nystagmus phase shift as a measure of nonlinearities. *USN Sch. Aviat. Med. NASA joint res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 73; NASA Order R-37. 17 p.—The existence of nonlinearities in the steady-state response of the oculovestibular system to sinusoidal angular acceleration is demonstrated by evaluation of corneo-retinal potential recordings obtained at rotation frequencies of 0.002 to 0.20 cps with peak acceleration levels ranging from 10 to 80 deg/sec.² The experimental and theoretical considerations involved in using the nystagmus transition technique to study these nonlinearities are discussed, and an illustrative application of their quantification is presented.—*USN SAM & NASA*.

4279. Human Resources Research Office. Collected papers related to the study of the effects of sensory deprivation and social isolation. *HumRRO res. Memo.*, 1962, Task Pioneer VI (Endorse). 42 p.—A collection of 8 Project Endorse studies to serve as background and perspective for Human Resources Research Office reports in preparation and for researchers in general in the area of sensory and social deprivation. (99 ref.)—*R. Tyson*.

4280. Leiderman, Herbert P. (Harvard Medical School) Man alone: Sensory deprivation and behavioral change. *Correct. Psychiat. J. soc. Ther.*, 1962, 8(2), 64-73.—A general review of findings which indicate that man requires adequate sensory and social stimulation for maintaining normal psychological and physiological functioning. Inadequate supply of such stimuli may result in mental aberrations or general impairment of mental processes, including increased susceptibility to suggestion.—*L. R. Witt*.

4281. Murphy, D. B., & Myers, T. I. (Human Resources Research Office, Monterey, Calif.) Occurrence, measurement and experimental manipulation of visual "hallucinations." *Percept. mot. Skills*, 1962, 15(1), 47-54.—Frequency and "complexity" of visual sensations were measured under sensory deprivation. $\frac{1}{2}$ the sample were given a short Rorschach prior to the deprivation study. The other $\frac{1}{2}$ had no Rorschach but, like the Rorschach group, were divided into 2 groups, with one receiving "encouraging" and the other "discouraging" instructions. Encouraging instructions, but not the pre-testing, was related to more frequent and more complex reporting of sensations. A plea is made for better measurement and use of controls and standard conditions for sensory deprivation studies.—*W. H. Guertin*.

4282. Walters, Cathryn; Shurley, Jay T., & Parsons, Oscar A. (VA Hosp., Oklahoma City) Differences in male and female responses to underwater sensory deprivation: An exploratory study. *J. nerv. ment. Dis.*, 1962, 135(4), 302-310.—8 female and 8 matched male Ss were observed in an underwater sensory deprivation study and interviewed following it in an effort to determine differences in responses as a function of the sex of the S and that of the interviewer. Results showed that "males tended to be less introspective and more stimulus-oriented than females." The social sexual role of the interviewer also affected the reports obtained.—*N. H. Pronko*.

4283. Ziskind, Eugene, & Augsburg, Theodore. (U. Southern California, Los Angeles) Hallucinations in sensory deprivation: Method or madness? *Science*, 1962, 137(Whole No. 3534), 992.—10-minute observations of visual fields in binocularly patched Ss, and self-observation for dreams yielded visual imagery similar to sensory deprivation hallucinations. The latter probably arise from fragments of normal imagery whose origins are unrecognized because of reduced awareness.—*Journal abstract*.

4284. Zubek, J. P., Aftanas, M., Hasek, J., Sansom, W., Schludermann, E., Wilgosh, L., & Winocur, G. (U. Manitoba) Intellectual and perceptual changes during prolonged perceptual deprivation: Low illumination and noise level. *Percept. mot. Skills*, 1962, 15(1), 171-198.—42 Ss were placed individually in an isolation chamber. Of this sample, 29 Ss endured isolation for 7 days. A group of 40 ambulatory and a group of 40 recumbent control Ss were also given the same tests at the same time intervals. Significant impairments were found on 8 of the 12 tests of the intellectual battery. Little or no relationship seemed to exist between degree of intellectual impairment and duration of isolation. Significant impairments were found on 5 of the 8 perceptual tests. Ss were also less sensitive to pain. Hallucinatory-like experiences were found to be infrequent.—*W. H. Guertin*.

SLEEP & FATIGUE

4285. Clarke, David H. (U. California, Berkeley) Strength recovery from static and dynamic muscular fatigue. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 349-355.—30 university students were each given 2 types of local fatiguing exercise utilizing a spring-loaded hand ergograph. 6 min. of dynamic contractions at the rate of 30 per min. caused strength to decline from an initial value of 45.7 kg. to a steady-state value of 27.6 kg. The $\frac{1}{2}$ -time (rate of decline) was 89 sec. The corresponding figures for 2 min. of continuous static exercise were 46.9 kg., 15.8 kg., and 38 sec. Mathematical analysis of these fatigue curves confirmed the results of others. The progress of recovery was observed for 10 min. A 2-component exponential equation accounted for the observed progressive return of strength. However, the rate parameters were quite different in the 2 curves; recovery was much faster and followed a different pattern after static exercise.—*Journal abstract*.

4286. Corcoran, D. W. J. (Medical Research Council, Cambridge, England) Noise and loss of sleep. *Quart. J. exp. Psychol.*, 1962, 14(3), 178-182.—2 experiments are reported in which human performance was compared under continuous 90 db. white noise, after loss of sleep, under a combination of the 2, and under appropriate control conditions. The results suggest that noise is effective in reducing the deterioration in performance, characteristic of loss of sleep. The relevance of the result to the arousal theory of loss of sleep is discussed.—*Journal abstract*.

of articles is devoted to studies on: (a) fatigue and restoration in the organism in mental and physical activity and (b) those conditions in which fatigue leads to pathological changes.—*I. D. London.*

MOTIVATION & EMOTION

4288. Abelson, Robert P., & Sermat, Vello. (Yale U.) **Multidimensional scaling of facial expressions.** *J. exp. Psychol.*, 1962, 63(6), 546-554.—30 women gave 9-point rating scale judgments of the dissimilarity of emotional expression of each of 78 pairs of facial poses formed from combinations of 13 diverse stimuli of the Lightfoot Series. The dissimilarity ratings were converted to interstimulus distances. These findings were compared with the distances one would expect on the basis of the 3 Schlosberg scales of facial expression. Concluded that a 2-dimensional system would appear to be adequate: pleasant-unpleasant and tension-sleep, or perhaps a slight variant of the latter.—*J. Arbit.*

4289. Bryan, J. H., & Carlson, P. V. (U. California, Los Angeles) **Spontaneous activity and food deprivation in human subjects.** *Percept. mot. Skills*, 1962, 15(1), 123-126.—The purpose of this study was to test the hypothesis that one characteristic effect of hunger deprivation is to increase the level of spontaneous activity. 5 men were deprived of food for a minimum of 89 hr., while 2 other adults served as control Ss. The number of squares entered in an "open-field" during a 15-min. period, twice a day, was used to measure spontaneous activity. Comparison of the control and the experimental groups failed to demonstrate significant differences in spontaneous activity.—*W. H. Guertin.*

4290. Duffy, Elizabeth. (U. North Carolina) **Activation and behavior.** New York: Wiley, 1962. xvii, 384 p. \$7.95.—This book presents a group of interrelated hypotheses in regard to "activation" based in the main upon studies of muscle tension, EEG, electrical resistance of the skin, and such other measures of autonomic reactivity as heart rate, blood pressure, respiration rate, etc. 6 chapters are devoted to a discussion of the concept of activation, 2 chapters to the effects of variations in activation upon sensory and performance measures, and 3 chapters to the effects of individual differences in activation particularly related to the behavioral correlates of these individual differences. (41-page bibliogr.)—*J. Arbit.*

4291. Frijda, Nico H., & Philipszoon, Els. (U. Amsterdam, Netherlands) **Dimensions of recognition of expression.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 45-51.—Ratings of 30 facial expression photographs by 12 Ss on 22 bipolar scales were intercorrelated and subjected to factorial analysis. 4 factors of expressive meaning were obtained; these were labeled pleasantness-unpleasantness, naturalness and submission-artificiality and condescension, intensity of expression-control of expression, and attentional activity-disinterest. Correlating these factors with measures of the facial features resulted in meaningful relationships of each expressive meaning factor with 1 or more of the facial feature measurements. Results were compared with those from other studies and discussed in relation to a theory of emotion and of its recognition.—*Journal abstract.*

Rdsch.*, 1962, 13(4), 256-269.—Emotion is no longer seen as an isolated phenomenon but a phenomenon related to the persistent personality dimension of endothymic ground. Wundt's 3-dimensional theory of emotions can still be recognized in the 3 polar basic forms of endothymic ground. There is in addition the tendency to conceptualize these basic forms as energy vectors.—*W. J. Koppits.*

PSYCHOMOTOR TASKS

4294. Adams, Jack A. (U. Illinois) **Test of the hypothesis of psychological refractory period.** *J. exp. Psychol.*, 1962, 64(3), 280-287.—The psychological refractory period (the response to the 2nd of 2 closely spaced stimuli is slower) has received 2 explanations: (a) a central process in which time must be allowed for processing the 1st stimulus before the 2nd can be undertaken and (b) an expectancy statement to the effect that past experience with the random array of interstimulus intervals employed causes S to expect a longer delay and he is not optimally ready to respond when there is a short interval. Using a 2-dimensional, bisensory discrete tracking task, and manipulating the interstimulus intervals, support was found for the expectancy hypothesis. (21 ref.)—*J. Arbit.*

4296. Amrom, S. D. (USSR Acad. Sciences) **Issledovanie parametrov tselenapravlennoi dvigatel'noi reaktsii.** [Parameters of a purposeful motor reaction.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 54-62.—Ss (not described) were asked to react to an auditory stimulus by pressing a rubber balloon until the mark 50 was reached on the scale of the reflexometer. This was then repeated with the scale being covered. This is called the method of conditioned level. Three indices of motor reaction were recorded: strength of the pressure, time of the pressure, and the reaction time. The motor reactions obtained with covered scale are related to different functional states of the central nervous system: the reaction exceeding the level is observed when the excitatory process prevails over the inhibitory one; the exact response, when both nervous processes are balanced; and a diminished response, when the inhibitory process predominates.—*A. Cuk.*

4297. Bartz, Albert E. (U. Arizona) **Eye-movement latency, duration, and response time as a function of angular displacement.** *J. exp. Psychol.*, 1962, 64(3), 318-324.—"The present research was initiated with two purposes in mind: (a) to determine the speed of seeing in a complex visual task (Exp. I) and (b) to isolate and measure the various components of the total response (initial

latency, travel time of the eye, and the response time for interpreting the signal). Results of Exp. I showed that RT increased as the angle from the center line of regard increased. There was no significant difference between pairs of means for right and left sides. It was also found that response time increased as the number of possible signals increased. In Exp. II, the time required for each of the three components of the response increased as the angle increased. Several interpretations of the positive relationship between angle and the time required for S to make his vocal response after his eyes had reached the signal were considered.—*J. Arbit.*

[Experimental study regarding the effects of reaction conditions.] *Psychol. u. Praxis*, 1962, 6(1), 14-20.—In a light-stimuli presentation experiment the experimental group was told that improvement was expected during a 2nd performance since the 1st performance had been inadequate. The control group repeated the task with the same instructions as given initially. It was concluded that the changed instructions had the effect of reducing errors and reaction time significantly.—*H. Roemmich.*

4300. Broadbent, D. E., & Gregory, Margaret. (Applied Psychology Research Unit, Cambridge, England) Donders' B- and C-reactions and S-R compatibility. *J. exp. Psychol.*, 1962, 63(6), 575-578.—Donders found that the reaction time to a stimulus when 2 were presented and each required a different response is longer than the reaction time to a stimulus when the other randomly occurring stimulus required that no response be made. The authors hypothesized that this finding might be understood on the basis of S-R compatibility. Using both verbal and tactual stimuli with S-R compatibility (S repeated the stimulus word or moved the finger which was stimulated) or S-R less compatible (visual stimulus required finger response, and vice versa) found no reaction time difference under the former condition while the latter condition showed the classic difference between the b- and c-conditions.—*J. Arbit.*

4301. Chuprikova, N. I. (Inst. Psychology, Acad. Pedagogical Sciences, Moscow, USSR) O lokal'nom tormozhenii afferentnykh impul'satsii pod vlianiem slovesnykh razdrazhitelei. [Local inhibition of afferent impulses under the influence of verbal stimuli.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 229-236.—Ss were instructed to react to combinations of light flashes under conditions of different verbal instructions. It was found that verbal stimuli selectively inhibit that part of direct stimulation which is superfluous according to preliminary instructions. Thus, if a successive series of lamps producing bright and dim flashes is presented to the Ss and they memorize, according to instructions, only the location and the sequence of the dim flashes, a state

of lower excitation is observed at the cortical points corresponding to bright flashes.—*A. Cuk.*

4302. Davis, R. (U. Reading, England) Choice reaction times and the theory of intermittency in human performance. *Quart. J. exp. Psychol.*, 1962, 14(3), 157-166.—1 visual signal, drawn from 2 equiprobable alternatives, was followed at a variable interval by a similar signal, also drawn from 2 equiprobable alternatives. The relationship between reaction time to the 2nd signal and the interval between signals was studied under the following conditions: (a) Ss were trained from the beginning to regard the 1st signal as irrelevant. (b) Ss were asked to report on the nature of the 1st signal after they had responded to the 2nd. The interval between signals was 1 of the 5 values, 50, 100, 150, 200, 250 msec. In the "regular interval" situation the same interval was used over a block of 20 trials. In the "random interval" situation the values of the interval were randomly arranged, with equal frequency within each block of 20 trials. The results showed: (a) In the random interval situation there was a definite disturbing effect of the 1st signal on the reaction time to the 2nd, despite the fact that Ss were trained to disregard the 1st signal. However, the delays in reaction time were significant only at the shortest interval, 50 msec. (b) In the regular interval situation this disturbing effect was not evident. (c) The additional requirement of having to report on the nature of the 1st signal produced no consistent increase in reaction time to the 2nd signal. Some implications of these results for the conception of the human operator as a channel of limited capacity are discussed.—*Journal abstract.*

4303. Fehrer, Elizabeth, & Biederman, Irving. (Brooklyn Coll.) A comparison of reaction time and verbal report in the detection of masked stimuli. *J. exp. Psychol.*, 1962, 64(2), 126-130.—"In the present study, we have compared the accuracy of two measures, reaction time and verbal report, in the detection of an event subjected to retroactive masking. A 5-msec. darkening of an otherwise steadily illuminated area was followed, after delays varying from 0 to 75 msec., by a 100-msec. illumination of two adjoining areas. At certain critical delays at which verbal detection of the test stimulus was little above chance accuracy, RT to the darkening of the test stimulus was not affected by the delayed presentation of the masking lights. Compared with verbal report, therefore, RT provided a far more accurate measure of the presence of the masked stimulus event."—*J. Arbit.*

4304. Gray, R. K., Start, K. B., & Walsh, A. (U. Western Australia) Relationship between leg speed and leg power. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 395-399.—With the previous development of a new test of leg power based on scientific principles, the problem of the components of the term muscular power was investigated. A test of leg speed using the bicycle ergometer was refined and had a test-retest reliability 0.969 when subsequently used on the experimental sample of 62 adult males. The factors of leg speed and leg power were then compared and a correlation of +0.470 was established. This was mathematically lower than figures relating speed and power obtained by previous researches in this field and was probably

due to the differences in the criterion measures together with sample and experimental error.—*Journal abstract.*

4305. Hellebrandt, F. A., & Waterland, Joan C. **Expansion of motor patterning under exercise stress.** *Amer. J. phys. Med.*, 1962, 41, 56-66.—Progressively increasing exercise stress evokes an orderly expansion of the motor response typical of the individual. Young adults exerting all-out effort exhibit relative functional decortication; response to extensive stimuli diminishes and behavior becomes stereotyped and automatic. The will to continue fails before dominantly suppressive reactions are aroused. Recruitment of reserve motor units is effected by augmenting the sensory input achieved through orderly automatic muscle-response expansion.—H. J. P. Schubert.

4306. Hellebrandt, F. A., & Waterland, Joan. **Indirect learning: The influence of unimanual exercise on related muscle groups of the same and the opposite side.** *Amer. J. phys. Med.*, 1962, 41, 45-55.—Practice limited to a muscle group increases the performance also of the ipsilateral antagonist and the contralateral agonist-antagonist. Observation of another exercising yielded a measurable influence of the O's subsequent performance.—H. J. P. Schubert.

4307. Helson, Harry, & Steger, Joseph A. (Kansas State U.) **On the inhibitory effects of a second stimulus following the primary stimulus to react.** *J. exp. Psychol.*, 1962, 64(3), 201-205.—"An earlier finding that a light following a sound or a sound following a light after an interval of 75 msec. lengthened RT to the stimulus first presented was verified in the present experiment in which the stimuli were both visual. RT to S_1 was significantly increased when S_2 followed S_1 at intervals ranging from 10 to 170 msec. with the maximum effect occurring from 40 to 140 msec. . . . While RT with S_2 present decreases with practice, the greater improvement of control Ss as compared with experimental Ss shows that the inhibitory effect of S_2 on S_1 is not completely negated by 360 repetitions. . . . While the individual differences and results of practice seem to argue in favor of attitudinal factors as responsible for the effect, other facts argue against this explanation. Two hypotheses were discussed but neither seems completely satisfactory to explain all the facts."—J. Arbib.

4308. Kroll, Walter. (Fort Hays Kansas State Coll.) **Reliability of a selected measure of human strength.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 410-417.—5 trials spaced a minute apart were secured on 50 male Ss 3 days in succession on an apparatus designed to isolate action of the right wrist flexor muscle group. Reliability of measurement was assessed through the intraclass correlation technique. Although an acceptable level of reliability was obtained ($R = .93$), nonpertinent factors apparently intruded. These were tentatively identified as a trial effect due to depletion of energy reserves for strength exertion, and a day effect due to either strength development, a learning effect, or a combination of strength development and learning effects. Consideration of such factors in measurement programs was noted.—*Journal abstract.*

4309. Morin, Robert E., & Forrin, Bert. (U. Arizona) **Mixing of two types of S-R associations**

in a choice reaction time task. *J. exp. Psychol.*, 1962, 64(2), 137-141.—2 types of S-R associations were distinguished: (a) Type N associations (numeral-numeral pairs) normally produce independence of choice RT and transmitted information and (b) Type D associations (symbol-numeral pairs) in which choice RT is a positive linear function of transmitted information. The effects of mixing these 2 types upon the RT-transmitted information function was investigated. The results of the study appear to limit the generality of the proposition that RT for Type N associations is independent of the informational properties of the task.—J. Arbib.

4310. Pierson, William R., & O'Connell, Eugene R. (California Coll. Medicine, Los Angeles) **Age, height, weight, and grip strength.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 439-443.—This study recorded the age, height, weight, and grip strength of 299 healthy adult males, representing college students newly enrolled in a body conditioning class, college athletes, recruit policemen, and policemen. Analysis of the data showed that for men in condition and within the limits of the study, grip strength is significantly related to weight but not to height or age.—*Journal abstract.*

4311. Raab, David, & Fehrer, Elizabeth. (Brooklyn Coll.) **Supplementary report: The effect of stimulus duration and luminance on visual reaction time.** *J. exp. Psychol.*, 1962, 64(3), 326-327.—Flash duration ranged from 0.5 to 20 msec.; luminance from 0.3 to 3000 ft.L. For the 2 highest luminances, duration is unrelated to RT over the entire range studied. For the 2 lowest luminances, RT is an accelerated function of flash duration. The findings are discussed in terms of critical duration and phenomenal brightness.—J. Arbib.

4312. Raab, David H. (Brooklyn Coll.) **Effect of stimulus-duration on auditory reaction-time.** *Amer. J. Psychol.*, 1962, 75(2), 298-301.—Simple reaction-time (RT) to a noise burst was measured. Noise stimuli were produced by a Grason-Stadler 455B noise generator and were delivered to S by means of an earphone. Testing continued for 12 days. Ss were 3 undergraduate students and the author. All were well practiced before data were recorded. 2 intensities of noise were used and duration varied between 2 and 100 msec. RT decreased with increasing duration, reaching a minimum in approximately $\frac{1}{2}$ the duration required for full growth of loudness. "The trading function which relates intensity and duration depends on the performance being tested."—R. D. Nance.

4313. Royce, Joseph. (U. California, Berkeley) **Force-time characteristics of the exertion and release of hand grip strength under normal and fatigued conditions.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 444-450.—A recording, spring-loaded hand ergograph was used to record force-time relationships as 32 young men were tested on a hand dynamometer. Exponential equations were used to describe the changes in hand grip force during development and release. Stretch reached $\frac{1}{2}$ of its maximal value in .08 sec. and $\frac{3}{4}$ in .15 sec. During release, the force dropped to the halfway point in .04 sec. and to the $\frac{3}{4}$ point in .06 sec. Under conditions of fatigue the rate of buildup of muscular

force decreased 50%, and the rate of release decreased 150%.—*Journal abstract.*

4314. Schepers, J. M. A components analysis of a complex psychomotor learning task. *Psychol. Afr.*, 1962, 9, 294-329.—The test scores of 150 South African Air Force pupil pilots on the Portable Hand-Foot Reaction test are analyzed. The testing situation is described. The pupils were also given 2 tests of mental ability. The components, elementary and principal, of the performance and error scores of the RT test are analyzed and presented with equations, charts, and graphs. All learning may be reduced to transfer. Practice results in skill. More work needs to be done. A variety of tests should be analyzed to determine "the generality of components obtained with the RT and to test the invariance of the various parameters with respect to subject matter."—J. L. Walker.

4315. Simon, Stanford H. (Indiana U.) Response-mediated generalization with simple skeletal-motor responses. *J. exp. Psychol.*, 1962, 63(5), 458-463.—"On the basis of current S-R theory, including assumptions concerning the functions of response-produced stimuli, it was predicted that response-mediated generalization (a) can occur with simple skeletal-motor responses, (b) will be greater for one group of Ss than another if the first group has more pairings of the mediated response with the mediating response, and (c) will be greater for one group of Ss than another if the first group has an additional stimulus occurring contiguously with the mediating response. . . . The experimental results support the first prediction but not the third; no definite conclusion is drawn regarding the second prediction."—J. Arbit.

4316. Sipowicz, Raymond R., Ware, J. Robert, & Baker, Robert A. (USA Armor Human Research Unit, Fort Knox, Ky.) The effects of reward and knowledge of results on the performance of a simple vigilance task. *J. exp. Psychol.*, 1962, 64(1), 58-61.—80 army trainees monitored aperiodic and brief interruptions of a continuous light source under isolated conditions for a 3-hr. period. 1 group was paid on the basis of the signals they detected, 1 was informed of missed signals by a flash of light, 1 group had both knowledge of results (KR) and reward, and 1 group had neither. All experimental groups were better than the control, the group which had both KR and reward was best. Contrary to previous studies which found good and bad performers on a vigilance task, the present study finds that with the appropriate use of incentives the individual differences are attenuated.—J. Arbit.

4317. Strauss, P. S., & De Togni, G. R. (Picatinny Arsenal, Dover, N. J.) Limb sensitivity to wire barriers. *Percept. mot. Skills*, 1962, 15(1), 251-254.—The predetection forces applied to wire barriers by the limbs of blindfolded male Ss were measured and evaluated. Lower limb forces were found to be significantly larger than upper limb forces under a slow walk approach condition only. This difference is discussed in terms of ballistic vs. controlled movements and practical applications are mentioned.—W. H. Guertin.

4318. Thomas, D. R., & Lanier, W. G. (Kent State U.) A comparison of stimulus generalization of tendencies to respond and not to respond.

Psychol. Rec., 1962, 12, 61-65.—Human Ss were instructed to lift finger from telegraph key (response group) or to keep pressing it (no response group) when they perceived test stimulus as identical to original stimulus (525 Mu). The results supported hypothesis that with equivalent pregeneralization testing procedures "tendencies to respond and not to respond to a particular stimulus value generalize in a similar fashion." The data also indicate that discrimination training (used by others) is not essential in order to demonstrate this similarity.—R. J. Seidel.

4319. Witte, Fae. (San Jose State Coll.) Relation of kinesthetic perception to a selected motor skill for elementary school children. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 476-484.—The purposes of this study were (a) to determine whether or not selected measures of kinesthesia, involving arm positioning, were related to measures of accuracy in ball rolling, and (b) to discover whether or not there were any differences between elementary school boys and girls in kinesthetic measures and in ball rolling ability measures. 47 1st- and 2nd-grade boys and girls were tested on 4 arm positioning measures and 2 ball rolling measures. The results of the study indicated that: (a) there is no significant relationship between ball rolling and positional measures of kinesthesia; (b) there are no real differences between boys and girls in their ability to accurately repeat positional measures of kinesthesia; and (c) boys are significantly superior to girls in their ability to manipulate accurately large and small balls, as measured by the tests used in this study. (23 ref.)—*Journal abstract.*

ATTENTION & SET

4320. Bergum, Bruce O., & Lehr, Donald J. The effects of pairing, rest intervals, signal rate, and transfer conditions on vigilance performance. *HumRRO res. Memo.*, 1962, Subtask Vigil IV. iii, 69 p.—7 studies probed the relationship between tasks, environmental factors, and vigilance performance to identify techniques for securing "peak operator efficiency in vigilance situations." Special significance is attributed to absence of "any vigilance effect employing a null-meter display."—R. Tyson.

4321. Botwinick, Jack, & Brinley, Joseph F. (National Inst. Mental Health) An analysis of set in relation to reaction time. *J. exp. Psychol.*, 1962, 63(6), 568-574.—Principal component analyses were performed on reactions times (RTs) in relation to preparatory intervals (PIs) in 6 different series. These data were discussed in terms of the hypothesis that various aspects of RT set are distinguishable, different in meaning, and independent. Set, as inferred from the relations between RT and PI, was independent of sense modality.—J. Arbit.

4322. Broadhurst, D. E. Attention and the perception of speech. *Scient. American*, 1962, 206(4), 143-151.—If an individual listens to 2 voice messages at one time, he usually understands only one. This indicates that the brain has an "attention mechanism" for selecting the desired information.—*Journal abstract.*

4323. Grings, W. W., Carlin, Sidney, & Appley, Mortimer H. (U. Southern California) Set, suggestion, and conditioning. *J. exp. Psychol.*, 1962, 63(5), 417-422.—"A set or tendency to anticipate

that stimulation will follow a verbal cue suggesting such stimulation is inferred from the magnitude of GSR to the cue. The experimental procedures for modifying the set are analogous to classical conditioning procedures, except that the reinforcing state of affairs is not applied directly to the test cues but is applied instead to a series of seven different cues. . . . Plots of magnitude of response to the critical test cues as a function of position in the reinforcement series showed an increase of response to both cues at the short training test point, then a decrease with further training. The principal change occurred for the feasible stimulus during the short series of reinforcements."—*J. Arbit.*

4324. Janke, Peter K. (Reed Coll.) The effects of a "compound set" on learning efficiency. *Amer. J. Psychol.*, 1962, 75(3), 445-451.—It was hypothesized that the negative component of the set would become less effective with time, as a result of non-reinforcement. Stimulus material consisted of 216 words varying in length from 2 to 10 letters. Ss were 20 college men. They were asked to respond to each word with a number from 1 to 9. Results are interpreted as supplying evidence for the operation of a compound set.—*R. D. Nance.*

4325. Mazumdar, A. K., & Chatterjee, T. K. Duration of attention and colour preference. *Psychol. Stud., Mysore*, 1962, 7(2), 11-15.—Experiment has shown a high correlation between duration of attention and color preferences.—*U. Pareek.*

LEARNING

4326. Cratty, B. J. (U. California, Los Angeles) Effects of intra-maze delay upon learning. *Percept. mot. Skills*, 1962, 15(1), 14.—42 university students learned to traverse a maze. A previously unexposed delay chamber was used to delay $\frac{1}{2}$ the Ss. No differences in traversal time to or after the delay point were found between E and C groups. Results failed to support the idea that a 20-sec. delay would introduce disorientation with slower traversal time.—*W. H. Guertin.*

4327. Fleishman, Edwin A., & Parker, James F., Jr. (Yale U.) Factors in the retention and relearning of perceptual-motor skill. *J. exp. Psychol.*, 1962, 64(3), 215-226.—2 groups differing in the amount of verbal guidance were given extended training on a highly complex tracking task. Subgroups matched for final proficiency were retested at various intervals up to 24 mo. These retention groups were further subdivided for retraining sessions under massed or distributed practice. One week later all Ss were retested. Retention is extremely high, even for no-practice intervals up to 24 mo. Variations in retention interval from 1 to 14 mo. are unrelated to retention performance. The most important factor in retention is the level of proficiency achieved during initial learning. The amount of verbal guidance is unrelated to retention. Retraining under distributed practice was superior to mass practice, but on retesting 1 week later no difference was noted. Retention appears more a function of specific task habits acquired than to ability traits developed prior to training. (15 ref.)—*J. Arbit.*

4328. Fox, Margaret G., & Lamb, Ethel. (State U. Iowa) Improvement during a nonpractice period in a selected physical education activity.

Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr., 1962, 33(3), 381-385.—This study investigated the reminiscence factor in learning softball skills by 7th-grade girls. Tests used to measure the skills were the repeated throw and bat for distance. Pretests were followed by an instructional unit of 10 lessons on softball skills. This was concluded with the post-test. 5 weeks elapsed and the tests were given again (1st retest). 17 weeks elapsed between the 1st retest and the 2nd retest. No softball skill practice intervened during either the short or the long nonpractice intervals. Mean gains were not significant for the 1st nonpractice interval but were significant for the 2nd nonpractice interval. On the basis of the data it was concluded that improvement in softball skill of bat for distance and repeated throws did occur during a long interval without practice. In the absence of other factors which could explain the improvement, it appears that reminiscence is more apt to occur after a relatively long nonpractice interval than after a short period of time. The phenomenon of reminiscence probably occurred in this instance with this group of 7th-grade girls.—*Journal abstract.*

4329. Fox, Margaret G., & Young, Vera P. (State U. Iowa) Effect of reminiscence on learning selected badminton skills. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 386-394.—This study investigated the effects of the degree of original learning and the length of 2 nonpractice periods on reminiscence in badminton. 2 groups were used, one having 6 weeks of instruction, the other 9 weeks. The nonpractice periods were 6 weeks and 12 weeks. The wall volley and short serve tests were given at the beginning and end of the instructional periods and at the end of each nonpractice period. Reminiscence did occur in the wall volley skill during the 1st nonpractice interval for the group having 9 weeks of instruction and during the 2nd nonpractice interval for the group having 6 weeks of instruction. Reminiscence did not occur for either group on the short serve skill. (21 ref.)—*Journal abstract.*

4330. Jensen, Arthur R., Collins, Carter C., & Vreeland, Robert W. (U. California, Berkeley) A multiple S-R apparatus for human learning. *Amer. J. Psychol.*, 1962, 75(3), 470-476.—This electrical apparatus presents a variety of visual stimulus-objects in any desired sequence, limits S's responses by requiring him to press buttons varying in number and spatial arrangement, and delivers "feedback" on any desired schedule. Pictures of the apparatus are shown as well as a diagram of main components and of the wiring circuit.—*R. D. Nance.*

4331. Johnson, Ronald, & Thomson, Calvin. (San Jose State Coll.) Incidental and intentional learning under three conditions of motivation. *Amer. J. Psychol.*, 1962, 75(2), 284-288.—In the McGeogh and Irion definition of incidental learning, its operational meaning depends on adequacy of control of the set to learn. Materials used consisted of 2 lists of 10 nonsense syllables. Incidental material supposedly was of a "noxious" quality, that is, it constituted a distracting or interfering influence on intentional learning. Ss were 30 freshmen from introductory psychology. 10 Ss served at each of 3 motivation levels and worked in pairs. Incidental learning was measured by the frequency with which S later recognized the syllables learned

by his partner. Both the low and the medium motivation groups showed significant amounts of incidental learning. Low motivation was best for incidental learning; medium motivation facilitated intentional learning.—R. D. Nance.

4332. Kaufman, H., Smith, J., & Zeaman, D. (U. Connecticut) Tests of the generality of two empirical equations for motor learning. *Percept. mot. Skills*, 1962, 15(1), 91-100.—2 empirical equations written by Reynolds and Adams, describing pre-asymptotic pursuit rotor performance as a function of distribution and practice were tested both with the PR and the inverted-alphabet task. The equations described much of the data obtained in the experiments despite the difference in nature between the 2 tasks.—W. H. Guertin.

4333. Landsman, Howard J., & Turkewitz, Marvin. (City Coll. New York) Delay of knowledge of results and performance on a cognitive task. *Psychol. Rep.*, 1962, 11(1), 66.—A series of stimulus pairs was presented to 20 undergraduates who were required to choose the correct one of each pair. $\frac{1}{2}$ the Ss given knowledge of results immediately after each response learned faster than the half with a 6-sec. delay.—B. J. House.

4334. Lavery, J. J., & Suddon, F. H. (Defence Research Medical Lab., Toronto, Canada) Retention of simple motor skills as a function of the number of trials by which KR is delayed. *Percept. mot. Skills*, 1962, 15(1), 231-237.—The effect of trial-delay conditions on the acquisition and retention of 3 simple motor skills was investigated. The results indicated that within 30 trials, rate of acquisition is a function of number of trials by which knowledge of results is delayed; retention is not. If 90 trials are given, Ss in a 5-trial delay condition eventually reach the level of acquisition reached by the 0-trial delay group and they retain the skill better.—W. H. Guertin.

4335. Mandler, George; & Cowan, Philip A. (U. Toronto) Learning of simple structures. *J. exp. Psychol.*, 1962, 64(2), 177-183.—"Sixteen groups of 12 Ss each were required to learn the presence or absence of a checkmark associated with six pairs of nonsense syllables constructed out of three CVC syllables. The 16 groups differed in the structural relations among pairs of syllables and the presence or absence of checkmarks. . . . The results showed: (a) Number of checkmarks (or noncheckmarks) predicted the acquisition of structures, based apparently on discriminability of the checkmark-noncheckmark dichotomy. (b) Within three groups of structures with the same number of checkmarks, logical structure showed significant effects on acquisition. (c) The probability structure of the required responses (checkmarks) showed a striking effect on Ss' behavior. The Ss exhibited probability matching . . . in the absence of event matching."—J. Arbit.

4336. Moncrieff, John; Morford, W. R., & Howell, Maxwell L. (U. Alberta) Acquisition of elementary swimming skills. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 405-409.—52 beginning swimmers, aged 5 to 11, were taught by the same instructor for 6 consecutive 25-min. swimming lessons. 1 group practiced 3 days a week for 2 weeks, and the 2nd group attended 2 classes a week. Each swimmer was tested each day to deter-

mine when he completed the skill achievements (head under water, vertical float, face float, back float, 5-yd. swim, 10-yd. swim). No statistically significant difference was found between the groups on the ability to perform the 6 elementary water skills. The lesson frequencies investigated did not influence the ability to perform these skills. Only 16% of the 5-, 6- and 7-year age group could swim 5 yards following 6 lessons. From the older group 8, 9, 10 years, 68% performed the swimming skills in 6 lessons. There appears to be some justification for changing the order of teaching elementary water skills.—*Journal abstract.*

Conditioning

4337. Adams, Henry E., Butler, Joel R., & Noblin, Charles D. (Louisiana State U.) Effects of psychoanalytically-derived interpretations: A verbal conditioning paradigm? *Psychol. Rep.*, 1962, 10, 691-694.—36 students performed in a verbal conditioning task which required selection of a pronoun to complete a sentence. The use of "I" was reinforced with the word "good" or "fine" for one experimental group, and with a psychoanalytically-derived interpretation of S's response for another experimental group. The control group received neutral sentences of equal length as reinforcements. Frequency of correct response increased significantly for the 2 experimental groups but not for the control group. Latency of response was significantly decreased by affirmatory words but increased by the interpretative sentences, suggesting that these might be noxious stimuli.—B. J. House.

4338. Champion, R. A. (U. Sydney) Stimulus-response contiguity in classical aversive conditioning. *J. exp. Psychol.*, 1962, 64(1), 35-39.—The short-latency eyeblink and long-latency GSR were conditioned simultaneously with tone as CS and air puff as UCS. A forward CS-UCS interval of 400 msec. and a backward UCS-CS interval of 1200 msec. were used in separate groups to favor contiguity of CS with eyeblink and GSR, respectively. Eyeblink acquisition was superior with the forward interval and inferior with the backward interval when compared with that of the GSR. The results support the hypothesis that CS-UCR contiguity is an important factor in the initial stages of classical aversive conditioning.—J. Arbit.

4339. Chatterjee, Bishwa B., & Eriksen, Charles W. (U. Illinois) Cognitive factors in heart rate conditioning. *J. exp. Psychol.*, 1962, 64(3), 272-279.—The conditioning and semantic and color generalization of the heart rate was studied as a function of the Ss' expectancies. Clear evidence of heart rate conditioning occurred only when S could verbalize the relationship between CS and UCS. Ss told there would be no more shocks showed almost a complete loss of the CR with no nonreinforced presentations of CS. Heart rate responses to nonconditioned stimuli also varied as a function of expectancy. No semantic or color generalization was found, and this is in keeping with the fact that Ss did not include such generalized expectancies in their verbalizations.—J. Arbit.

4340. DeWolfe, Alan S. (VA Hosp., Hines, Ill.) Extinction of conditioned verbal responses. *Amer. J. Psychol.*, 1962, 75(2), 265-270.—It has been demonstrated that acquisition and extinction of verbal be-

havior parallel in a number of ways the instrumental responses developed in animals. Here, schedule of reinforcement and method of extinction were varied simultaneously. 3 schedules of reinforcement (100%, 75%, and 50%) were used during acquisition. Procedures used during extinction were: negative reinforcement of the response, omission of reinforcement, and reinforcement of a conflicting response. Ss were 180 men and women from undergraduate psychology classes. Using stimulus cards, Ss formed sentences using 1 of 6 pronouns. Reinforcement during acquisition consisted of the word "good" spoken by E in a neutral tone. There was no significant difference in acquisition among the groups with varying proportions of reinforcement. During extinction, negative reinforcement gave the largest decrement and omission of reinforcement the slowest decline.—R. D. Nance.

4341. Edwards, A. E., & Acker, Loren E. (Wadsworth VA Hosp., Los Angeles, Calif.) A demonstration of the long-term retention of a conditioned GSR. *Psychosom. Med.*, 1962, 24(5), 459-463.—GSRs were obtained from 11 World War II Navy veterans and a control group of 11 Army veterans, using the "battle stations" signal and 19 other sounds. The results showed that the Navy veterans gave a significantly greater response to the signal than their Army controls, even though 15-20 years had elapsed since the original aversive conditioning. Implications for psychosomatic theory and Gantt's theory of schizokinesis are discussed.—W. G. Shipman.

4342. Fowler, R. L., & Kimmel, H. D. (U. Florida) Operant conditioning of the GSR. *J. exp. Psychol.*, 1962, 63(6), 563-567.—Using 40 college students, the authors attempted to determine whether or not the unelicited GSR can be conditioned instrumentally using a visual reinforcer. The effects of the number of minutes of reinforcement following each unelicited GSR, the number of visual stimuli per minute of reinforcement, and whether or not the stimuli were contingent with the occurrence of unelicited GSRs were studied. The results were interpreted as supporting the conclusion that the unelicited GSR can be conditioned instrumentally.—J. Arbit.

4343. Gormezano, I., & Moore, John W. (Indiana U.) Effects of instructional set and UCS intensity on the latency, percentage, and form of the eyelid response. *J. exp. Psychol.*, 1962, 53(5), 487-494.—Studied were the effects of voluntary (V) and nonvoluntary (NV) blink instructions on the variations of eyelid responses under classical conditioning and extinction procedures with UCS intensity as a parameter. It was found that the responses of the V Ss could be conditioned, that studies which varied UCS intensity and concurrently employed a latency criterion to reject Ss as voluntary responders may have introduced a methodological error, and that V Ss may not follow appreciably different laws to variations in UCS intensity than NV Ss.—J. Arbit.

4344. Hartman, Thomas F., & Grant, David A. (U. Wisconsin) Differential eyelid conditioning as a function of the CS-UCS interval. *J. exp. Psychol.*, 1962, 64(2), 131-136.—Differential eyelid conditioning was studied at 4 CS-UCS intervals (400, 600, 800, and 1000 msec.). Conditioned discrimina-

tion increased as the CS-UCS interval increased. This was due to a rapid decrease in the percentage of responses to the negative stimulus as the interval was extended. For Ss who never or rarely showed the voluntary form of eyelid response the amount of conditioning to the positive stimulus showed an optimum at about the 600-msec. interval. Superior differential conditioning at the longer intervals may be due to a more complete mediating perceptual response at these intervals or may be interpreted in terms of longer time intervals required for inhibition. (17 ref.)—J. Arbit.

4345. Kimmel, H. D., Hill, Frances A., & Morrow, M. C. (U. Florida) Strength of GSR and avoidance conditioning as a function of CS intensity. *Psychol. Rep.*, 1962, 11(1), 103-109.—A 1000-cps tone was used as a CS in training finger withdrawal to avoid shock. Each of 7 groups of 9 students each was conditioned with a different tone intensity, ranging from 12 db. (approximate threshold) to 42 db. After 12 reinforced trials of delayed 450-msec. avoidance conditioning, equal numbers of Ss in each group were extinguished with 12, 27, or 42 db. "Magnitude of GSR on extinction trials . . . was significantly related to intensity of the acquisition CS. The relationship was curvilinear but primarily downward," with maximum conditioning at 17 db., indicating that "a slightly supra-threshold auditory stimulus is maximally effective in conditioning the GSR."—B. J. House.

4346. Kimmel, H. D., & Pennypacker, H. S. (U. Florida) Conditioned diminution of the unconditioned response as a function of the number of reinforcements. *J. exp. Psychol.*, 1962, 64(1), 20-23.—College students were used to test the hypothesis that the amplitude of the unconditioned GSR is gradually attenuated by the CS during conditioning and that this reduction in UCR amplitude vanishes when the CS is omitted and the UCS presented alone. The results "were interpreted as supporting the notion that a conditioned inhibitory process develops during reinforcement, under the control of the CS, which attenuates the amplitude of the UCR in the presence of the CS. The relationship between these findings and similar findings in a study of the relationship between amount of disinhibition and number of reinforcements was thought to add further support to the interpretation offered."—J. Arbit.

4347. Klinger, Burton I., & Prokasy, William F. (Pennsylvania State U.) A note on MAS score and the ready signal in classical eyelid conditioning. *Psychol. Rep.*, 1962, 10, 829-830.—"Three levels of MAS score and the presence or absence of a 'ready, blink' signal were varied in a 2 by 3 factorial design [with 165 students] in an effort to determine the role of the ready signal and the MAS variable in classical eyelid conditioning. While the absence of the ready signal led to higher conditioning performance, no differences were found as a function of manifest anxiety as measured by Taylor's Manifest Anxiety Scale."—B. J. House.

4348. Logan, Frank A., & Wagner, Allan R. (Yale U.) Supplementary report: Direction of change in CS in eyelid conditioning. *J. exp. Psychol.*, 1962, 64(3), 325-326.—Assuming that the important parameter of the CS is the amount of change from the pre-CS condition, a decrease in intensity

should be as effective a CS as an increase. Assuming that the absolute value of the CS has a motivational property, an increase in intensity should be more effective. Both an increase and decrease in intensity were equally effective CSs. Apparently no impairment in conditioning occurs when the CSs are reversed for the 2 groups. Generalization should be viewed in terms of a surface including the non-CS condition as well as the CS condition.—*J. Arbit.*

4349. Mednick, Sarnoff A., & Wild, Cynthia. (U. Michigan) Reciprocal augmentation of generalization and anxiety. *J. exp. Psychol.*, 1962, 63 (6), 621-626.—"A psychogalvanic reaction was trained to the word LIGHT under conditions of massed and distributed trials. In a factorial design the CR to the CS, LIGHT and mediated generalization stimuli, LAMP, SOFT, and SQUARE, were extinguished with 8-sec. and 20-sec. intertrial intervals. Spaced trials in conditioning produced greater amplitude of CR, greater generalization, and more resistance to extinction. Massed trials in extinction led to greater generalization and slower extinction. An interpretation of the results is offered in terms of reciprocal augmentation of anxiety and generalization, a phenomenon thought to have relevance for psychopathology."—*J. Arbit.*

4350. Moos, Rudolph H. (U. California School Medicine, San Francisco) The retention and generalization of operant conditioning effects in an interview situation. *J. abnorm. soc. Psychol.*, 1963, 66 (1), 52-58.—In a study of the conditioning of complex verbal habits, each of 30 female Ss had her established verbal habits assessed in 2 sessions by being asked to talk about herself. In subsequent sessions, the Ss in the experimental groups were positively reinforced (by a head nod and an "mm-hm") for either independence or affection statements, whereas control groups Ss were reinforced every 30 sec. regardless of the content of their speech. The results showed that: conditioning occurred, i.e., the experimental Ss increased in their use of the reinforced category; retention also occurred, i.e., the conditioning effects were stable over a 24-hr. period; and generalization did not occur.—*Journal abstract.*

4351. Moyer, K. E., & Lindley, Richard H. (Carnegie Inst. Technology) Supplementary report: Effects of instructions on extinction and recovery of a conditioned avoidance response. *J. exp. Psychol.*, 1962, 64 (1), 95-96.—An earlier study of conditioned finger withdrawal found that informing Ss just prior to extinction training that the UCS would no longer be delivered produced rapid extinction. This report presents a replication of that study but with a conditioned avoidance procedure, and also tested an implication of the drive level (D) interpretation of this result; viz., that the appropriate instructions could raise D level and lead to an increase in conditioned responding. As in classical conditioning, inhibitory instructions reduced the number of CRs during extinction after avoidance conditioning. The results also show that for Ss given inhibitory instructions, the appropriate instructions can increase the number of CRs after extinction, presumably by raising D level.—*J. Arbit.*

4352. Perez-Cruet, Jorge. (Walter Reed Army Inst. Research, Washington, D. C.) Conditioning of extrasystoles in humans with respiratory ma-

neuvers as unconditional stimulus. *Science*, 1962, 137 (Whole No. 3535), 1060-1061.—Extrasystoles are known to occur in some healthy individuals during common respiratory maneuvers such as holding the breath. Evidence is presented which shows that under controlled laboratory conditions this kind of extrasystole can be conditioned. Conditional stimuli signaling inspirations and expiration acquired the properties of the respiratory maneuvers by inducing extrasystoles during normal breathing.—*Journal abstract.*

4353. Porter, John J. (State U. Iowa) Stimulus generalization as a function of UCS intensity in eyelid conditioning. *J. exp. Psychol.*, 1962, 64 (3), 311-313.—"This study investigated the interaction between drive level and original and generalized stimulus conditions during extinction. One hundred Ss were first conditioned for 80 trials to respond to a .6-psi air puff on an 80% reinforcement schedule with a CS of 1500 cps. The Ss were then divided into four groups which were extinguished with either a 1500- or 400-cps tone and a .33- or 2.0-psi air puff. On all nonreinforced trials during acquisition and extinction the UCS was presented, but 2500 msec. after the CS. The results confirmed ($P < .05$ for Extinction Trials 1-40) the hypothesized interaction between drive level and original and generalized stimulus conditions predicted by Hull-Spence theory. The effect was not significant over Trials 1-10 or 1-20."—*J. Arbit.*

4354. Runquist, Willard N., Sidowski, Joseph, & Gormezano, I. (Pomona Coll.) Yoked comparisons of classical and avoidance conditioning in differential conditioning of the eyelid response. *Psychol. Rep.*, 1962, 11 (1), 43-50.—"The acquisition and extinction of CRs in differential eyelid conditioning were compared under standard classical, avoidance and yoked classical procedures [$N = 72$ students]. The major finding of the study was a failure to obtain significant discrimination under the avoidance procedure whereas significant discrimination was obtained under the yoked classical procedure. A tentative explanation was offered in terms of an increase in similarity of CS+ and CS- trials produced by the avoidance contingency."—*B. J. House.*

4355. Shickho, G. A. (USSR Acad. Medical Sciences, Leningrad) K voprosu ob obrazovanii uslovykh refleksov vysokikh poriadkov u vzroslykh liudei. [Formation of CR of higher orders in adults.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12 (1), 30-36.—Using the method of salivation and different stimuli such as sound, light, and words, CR were established in adult Ss. By means of the conventional method it was possible to reach a conditioning of 20th order. When verbal stimuli were used, a CR of the 5th order was obtained. "The mechanism of formation of higher order CR does not differ essentially from that of first order conditioning."—*A. Cuk.*

4356. Wolpin, Milton, & Milgram, Norman. (Nebraska Psychiatric Inst.) Learning without awareness and awareness without learning. *Psychol. Rep.*, 1962, 10, 867-874.—56 college students performed in a verbal conditioning experiment. "One group of Ss received unequivocal reinforcement, i.e., 'good' uttered in an approving tone; the other, equivocal reinforcement, i.e., 'good' uttered in an impersonal, disinterested tone. No difference in learning was found between conditions. Interview data were

analyzed and related to this failure to obtain positive results."—*B. J. House.*

Discrimination

4357. Green, Edward J., & Squier, Roger W., Jr. (Dartmouth Coll.) **The rate of learning a discrimination in relation to some predictive measures.** *Amer. J. Psychol.*, 1962, 75(2), 294-297.—Changes in frequency of responding may be predicted by simple statistical models of learning. Amount of change in rate of operant responding is dependent on the probability that the organism will sample various stimulus elements on a given occasion. This sampling ratio is designated as s/S where s is a number of elements sampled and S is the set of elements available. 2 implications of statistical theories of discrimination learning were tested, (a) that bright Ss should show relatively rapid acceleration in discrimination learning, and (b) that Ss with small ratios should be relatively variable throughout their performance. 18 Ss were chosen from introductory psychology on the basis of their College Predictive Index scores. "High" Ss accelerated more rapidly than "low" Ss in the reinforced condition. The prediction that intra- S variability in operant responding would be greater for "low" Ss was not supported.—*R. D. Nance.*

4358. Levine, Marvin. (Indiana U.) **Cue neutralization: The effects of random reinforcements upon discrimination learning.** *J. exp. Psychol.*, 1962, 63(5), 438-443.—2 colors were presented in a random sequence to college Ss who made 1 of 2 responses to each appearance. E said "right" or "wrong" in a prearranged, random, order. Later these words were contingent upon the occurrence of particular stimulus-response pairs. The random reinforcement always produced a decrement in performance on the discrimination task. In contrast to the cue neutralization process seen in mathematical models of discrimination learning, the results suggest that cue neutralization does not depend upon the existence of relevant cues, and that the sampling probability of a neutralized cue does not necessarily become zero.—*J. Arbit.*

4359. Nakamura, Charles Y., & Kaswan, Jaques W. (U. California, Los Angeles) **Effect of stimulus condition and reaction time information on spatial stimulus generalization.** *J. exp. Psychol.*, 1962, 64(1), 67-76.—The effects of stimulus arrangement and experimentally induced differences in response latency on performance of a spatial stimulus generalization (SG) with voluntary responses were studied. The findings were consistent with predictions of SG generated from a stimulus categorization hypothesis. Predictions of error frequency by this hypothesis were compared with those made from Hull's gradient summation hypothesis of SG. There appeared a close and consistent relationship between error frequency and latency on this task.—*J. Arbit.*

4360. Richards, James M., Jr. (U. Utah) **The cue additivity principle in a restricted social interaction situation.** *J. exp. Psychol.*, 1962, 63(5), 452-457.—"This study tested two hypotheses derived from the application of Restle's mathematical learning theory to social interaction: (a) For each person in a two-person social interaction situation, cues originating from the other person combine additively with

other nonsocial cues in the situation. (b) If a third person is added to the social interaction, the situation is changed only in that the total number of cues is increased additively." The data support both hypotheses and thus provide evidence for the operation of the cue additivity principle in social interaction.—*J. Arbit.*

4361. Summers, Stanley A. (U. California, Los Angeles) **The learning of responses to multiple weighted cues.** *J. exp. Psychol.*, 1962, 64(1), 29-34.—9th grade students were used to investigate the relation between the objective validity of certain cues and the extent to which these cues were used. The purpose was to analyze the learning of responses to multiple cues of different validities to determine how much the responses came to depend on each cue. The independent variable was the correlation between a criterion and each of 3 simultaneously presented visual cues. The dependent variable was the correlation between the cues and Ss responses. Successful cue utilization increased during the learning session. Ss responded to different cues simultaneously, and the extent to which cues were used differed with validity. Throughout cue utilization was proportional to cue validity.—*J. Arbit.*

4362. Thomas, David R., & Jones, Charles G. (Kent State U.) **Stimulus generalization as a function of the frame of reference.** *J. exp. Psychol.*, 1962, 64(1), 77-80.—"Five groups of 10 Ss each viewed a monochromatic light of 525 $m\mu$ (a middle-green) for 60 sec., and then were presented 12 different random series of wave lengths under instructions to respond only to the original color. The number of responses made to the different test stimuli constituted a gradient of generalization. Group 1 was tested with the series 485-525 $m\mu$, in 10- $m\mu$ steps; Group 2, 495-535 $m\mu$; Group 3, 505-545 $m\mu$; Group 4, 515-555 $m\mu$; and Group 5, 525-565 $m\mu$. Only Group 3, with a central value of 525 $m\mu$, produced a generalization gradient with a definite peak at 525 $m\mu$; in all other cases the peak of responding was displaced toward the center of the series of test stimuli. . . . These results support the assumption that the generalization test series serves as a frame of reference against which the memory trace of the original stimulus is judged."—*J. Arbit.*

Verbal Learning

4363. Ausubel, D. P., & Fitzgerald, D. (U. Illinois) **Organizer, general background, and antecedent learning variables in sequential verbal learning.** *J. educ. Psychol.*, 1962, 53(6), 243-249.—An analysis of covariance design was used with undergraduate students in studying the effects of an advance organizer, antecedent learning, and general background knowledge on the learning and retention of 2 unfamiliar sequential passages about endocrinology. The organizer, by providing relevant ideational anchorage, suggestively enhanced the learning of the material for those Ss with relatively poor verbal ability. Knowledge of the 1st passage constituted a statistically significant limiting condition in learning the 2nd passage when the influence of both verbal ability and general endocrinological knowledge was statistically controlled. Finally, general background knowledge in endocrinology significantly facilitated the learning and retention of the 1st passage, presumably

by increasing the familiarity of the new material.—*Journal abstract.*

4364. Battig, William F. (U. Virginia) Paired-associate learning under simultaneous repetition and nonrepetition conditions. *J. exp. Psychol.*, 1962, 64(1), 87-93.—The report of a series of experiments designed to control for several variables only inadequately controlled in earlier studies which concluded that associative learning is an all-or-none rather than a gradual incremental process. The earlier study indicated that a group receiving the same list of paired-associate items on each trial did not learn at a different rate than a group for whom all pairs not correctly responded to on any trial were removed from the list and replaced by new pairs on the following trial. The present results are directly contradictory to an all-or-none theory of association formation in paired-associate learning. (18 ref.)—*J. Arbit.*

4365. Cassem, Ned, & Kausler, Donald H. (St. Louis U.) Supplementary report: Effects of stimulus association value and exposure duration on R-S learning. *J. exp. Psychol.*, 1962, 64(1), 94.—Although a gross positive relationship exists between stimulus association value and the amount of R-S learning, a reversal between 0% and 33% Glaze values was noted. This was explained as a sampling artifact since only 2 syllables were included at each association value. The present study provides a more adequate sampling of stimulus items as well as an investigation of the effects of exposure duration during both S-R learning and R-S recall on the amount of R-S recall. The reversal between 0% and 33% was a sampling artifact and that R-S learning is sensitive to exposure duration during both the learning and recall periods.—*J. Arbit.*

4366. Coleman, E. B. (Human Resources Research Office) Sequential interferences demonstrated by serial reconstructions. *J. exp. Psychol.*, 1962, 64(1), 46-51.—“Two extraexperimental sources of interference were examined: (a) letter-sequence interferences, which result when a list presented for learning conflicts with English spelling habits, and (b) word-sequence interferences, which result when a list presented for learning conflicts with the habits of English syntax. Both interferences were studied by serial reconstructions. The first S was exposed to a list and then he tried to reconstruct its order. Each succeeding S tried to reconstruct the order given by the preceding S. With each successive reconstruction, scrambled lists came closer and closer to sensible English. However, the orderings reached an asymptote after which there was no further approach toward English.”—*J. Arbit.*

4367. Ernst, Ronald L., Thompson, Charles P., & Brogden, W. J. (U. Wisconsin) Effect of pattern and pleonasm location in serial lists upon acquisition and serial position errors. *J. exp. Psychol.*, 1962, 64(2), 151-157.—312 college Ss learned by serial anticipation a series of 16 numbers composed of 10, 20, 30, and 40 each occurring 4 times. The control list was a random sequence without pleonasm. The experimental lists included one of 4 types of pleonasm at one of 3 loci. Acquisition was consistently faster for lists with a triplet or quadruplicate than for the control list. The form of the serial position error curve was altered by each pleonasm and

there was significant interaction in form of the curve and locus of pleonasm. The effects of these pleonasm found in previous maze learning studies were compared with the present findings.—*J. Arbit.*

4368. Glanzer, Murray, & Peters, Stanley C. (U. Maryland) Re-examination of the serial position effect. *J. exp. Psychol.*, 1962, 64(3), 258-266.—Serial position effects are usually defined on the basis of the beginning of a list. In rote learning there appear to be 3 factors associated with a repetitively appearing gap that separates the “end” from the “beginning” of the list: primacy-recency, spacing, and chaining versus association break. The effects of these factors in generating the serial position effect was studied in 3 experiments using Army enlisted men (Experiments I and II) and college students (Experiment III). The major factor determining the serial position effect appeared to be the amount of space between the end and the beginning of the list such that an increase in spacing produced a more marked effect.—*J. Arbit.*

4369. Hakes, D. T., & Jenkins, J. J. (U. Minnesota) Group paired-associate learning: Applicability to the study of mediated generalization. *Percept. mot. Skills*, 1962, 15(1), 219-228.—A series of 4 experiments were performed to assess the adequacy of a group paired-associate learning procedure as an alternative to the individual procedure now commonly in use. 3 alternative accounts of the failure of the group experiments to yield mediated generalization were suggested, and it was concluded that the evidence available at present is insufficient to consider the group-learning procedure an acceptable alternative to individual testing.—*W. H. Guertin.*

4370. Healy, N., & Voss, James F. (Coll. Wooster) Effect of list repetition upon multiple S-R₁, S-R₂ verbal acquisition. *Psychol. Rep.*, 1962, 10, 647-650.—96 Ss received 120 trials on a paired-associate learning task in which each stimulus word was followed by either of 2 response words. The list consisted of 6 stimulus words with response word probabilities varying from 1.0-0.0 to .5-.5 in steps of .1. Results did not differ for groups given repetitions of identical trial sequences of 10, 20, or 60 trial blocks or 120 trials with no systematic repetition of sequences. Results corroborate and act as a control for previous findings.—*B. J. House.*

4371. Horowitz, Leonard. (Stanford U.) Associative matching and intralist similarity. *Psychol. Rep.*, 1962, 10, 751-757.—To minimize effects of response learning, a paired-associate method was devised in which after each presentation of a list of 12 word-trigram pairs, S was provided with a set of response terms and required to match them with the stimulus terms. Of 4 groups of 15 students each, the 2 groups trained with high intralist similarity of either stimulus terms or response terms had significantly poorer performance than the 2 groups with low intralist similarity. Implications of these findings for interpretation of previous results are discussed.—*B. J. House.*

4372. Jensen, Arthur R. (U. California, Berkeley) Temporal and spatial effects of serial position. *Amer. J. Psychol.*, 1962, 75(3), 390-400.—4 experiments were performed. Ss were either upper-division or graduate students in Education. Stimuli

were 9 colored geometric forms. Experiment I required S to reconstruct a spatial serial arrangement. In Experiment II, S learned to match each of the 9 stimuli with 1 of a set of 9 buttons. Experiments III and IV were control experiments. Essential features of the serial position curve "emerge under conditions involving neither serial anticipation, nor temporal order of the stimulus-items, nor even serial order of the stimulus-items." The typical bowed serial-position curve appeared even when the conditions used by Hull to explain serial position effect did not exist.—R. D. Nance.

4373. Jensen, Arthur R. (U. California) **The von Restorff isolation effect with minimal response learning.** *J. exp. Psychol.*, 1962, 64(2), 123-125.—Previous studies have shown that the primary effect of isolating or perceptually emphasizing an item in a serial learning task is to accelerate the learning of the isolated item as a response. The present study minimized the role of response learning by using items which were already known so that all S had to learn was the serial order and by using isolated and nonisolated lists which were identical in terms of the responses which were required. The isolation effect was seen in terms of fewer errors in the isolated position. There was no increase in the number of intrusions of the isolated item nor did isolation facilitate learning the over-all list. "It was suggested that when the effects of response learning per se are eliminated, isolation merely changes the order of learning the positions of the items in the serial list."—J. Arbit.

4374. L'Abate, Luciano. (Washington U. School Medicine) **Transfer of learning with differences in associative value and in manifest anxiety.** *Amer. J. Psychol.*, 1962, 75(2), 251-258.—It was hypothesized that a higher level of manifest anxiety should produce greater response facilitation, greater response interference, and greater stimulus-response interference. Ss were 480 undergraduates from the upper and lower quarters on Taylor's scale of Manifest Anxiety. There were 12 equal subgroups, counter balanced for sex and anxiety level. Ss learned lists of paired-associate nonsense syllables differing in associative value. Following the initial learning, each S learned another list of paired-associates in 1 of 3 transfer conditions. There was a significant interaction between anxiety level and transfer conditions, but women appeared to be mainly responsible for it. For men only, there was a significant interaction between anxiety level and lists (associative strength).—R. D. Nance.

4375. Long, R. I. (Menninger Found.) **Field-articulation as a factor in verbal learning and recall.** *Percept. mot. Skills*, 1962, 15(1), 151-158.—Field-articulation, which was defined as the capacity to articulate or differentiate complex stimulus fields, was investigated as a factor in warm-up, original learning, free recall, and relearning with lists of meaningful words having high intra- and interlist similarity. Thurstone's Concealed Figures Test was used as the criterion test for field-articulation. On the basis of the results of this experiment and previous findings, it was concluded that the field-articulation control principle is an important determinant of learning and recall in an interference situation.—W. H. Guertin.

4376. Musgrave, Barbara S. (U. Massachusetts) **The effect of nonsense-syllable compound stimuli on latency in a verbal paired-associate task.** *J. exp. Psychol.*, 1962, 63(5), 499-504.—This study was concerned with the effects on response latency of convergent, divergent, and associated-nonassociated nonsense-syllable compounds. Although differences among the experimental compound conditions were slight, the rank order of increasing latencies was that which had been predicted.—J. Arbit.

4377. Newman, Slater E., & Buckhout, Robert. (North Carolina State Coll.) **S-R and R-S learning as functions of intralist similarity.** *Amer. J. Psychol.*, 1962, 75(3), 429-436.—Research has demonstrated that in verbal learning the S who learns S-R pairs may also be learning R-S pairs. Accepting a parsimonious view, variables affecting learning rate of S-R pairs will similarly affect rate of learning R-S pairs. Increased intralist similarity should lead to increased generalization and a decreased rate of establishment of R-S associations. Present results suggest that with increased similarity among S-terms and among R-terms number of correct responses during R-S recall decreases.—R. D. Nance.

4378. Peterson, Lloyd R., & Peterson, Margaret Jean. (Indiana U.) **Minimal paired-associate learning.** *J. exp. Psychol.*, 1962, 63(6), 521-527.—"The short-term retention of minimal numbers of paired associates was studied in four experiments. Pairs of words were presented in a memory drum and tested for recall by presenting a stimulus after some interval no longer than 16 sec. during which Ss counted backward. Recall decreased as number of pairs increased, but a primacy effect complicated an interpretation in terms of competing responses. This primacy effect was presented with either one or two presentations of a pair. When the stimulus situation at recall was extended to include the alternate pair of words, the primacy effect was reduced. Errors at recall were largely words from the set of pairs just presented."—J. Arbit.

4379. Postman, Leo. (U. California) **The effects of language habits on the acquisition and retention of verbal associations.** *J. exp. Psychol.*, 1962, 64(1), 7-19.—"Three experiments investigated the transfer effects of language habits on the acquisition and retention of verbal association. They tested the assumption that both positive and negative transfer effects (unit-sequence facilitation and unit-sequence interference) increase as a function of the frequency of usage of words. The balance of unit-sequence interference and facilitation determines the speed of acquisition and the rate at which interferences recover with the passage of time."—J. Arbit.

4380. Postman, Leo. (U. California, Berkeley) **Repetition and paired-associate learning.** *Amer. J. Psychol.*, 1962, 75(3), 372-389.—Using a procedure introduced by Rock, 2 experiments investigated repetition with paired nonsense syllables. Ss spelled the items during training. One control group learned the initial lists of the experimental Ss; the other control group learned the terminal lists. In one experiment, correction was given on test-trials; in the other experiment, no correction was given. In both, experimental Ss learned significantly more slowly than control Ss. Superiority of the control groups is due, at least in part, to the effects of repeti-

tion on integration of responses. The effects of repetition on the associative stage of learning remain indeterminate. Serious doubt is thrown on the validity of Rock's evidence for one-trial learning.—*R. D. Nance.*

4381. Rosen, Harold; Richardson, Donald H., & Saltz, Eli. (Wayne State U.) **Supplementary report: Meaningfulness as a differentiation variable in the von Restorff effect.** *J. exp. Psychol.*, 1962, 64(3), 327-328.—College students learned lists of low-meaningful items and lists of high-meaningful items with the item in Position 5 on both lists typed in red while the other items were typed in black. Isolation has a much greater relative effect in a list of low-meaningfulness than a list of high-m items. This finding is discussed in terms of the theory for the von Restorff effect previously proposed by Saltz.—*J. Arbit.*

4382. Salzinger, Kurt; Portnoy, Stephanie, & Feldman, Richard S. (New York State Dept. Mental Health) **The effect of order of approximation to the statistical structure of English on the emission of verbal responses.** *J. exp. Psychol.*, 1962, 64(1), 52-57.—College students guessed the words that were systematically deleted from a series of passages varying in order of approximation to the statistical structure of English. The higher the order of approximation to English the greater the proportion of words guessed. The proportion of words in the correct grammatical category also increased with increasing order of approximation. The assumption of equal intervals between successive orders of approximation is untenable, and the relationship between memory and order of approximation to English may be explained in part by syntactical structure and in part by the meaning called for by the context. (17 ref.)—*J. Arbit.*

4383. Seidel, Robert J. (George Washington U.) **The importance of the S-R role of the verbal mediator in mediate association.** *Canad. J. Psychol.*, 1962, 16(3), 170-176.—To permit a direct comparison of the effects of backward and forward mediation, 2-syllable adjectives equated for similarity in triad pairs were learned by the method of anticipation. Mediation occurred irrespective of the specific S-R character of the mediator.—*R. S. Davidson.*

4384. Spieth, T., & Voss, James F. (Coll. Wooster) **Distribution of practice and probabilistic verbal acquisition.** *Psychol. Rep.*, 1962, 10, 663-666.—3 groups of 24 Ss each received 120 trials on a 6-item paired associate list in which each stimulus word was followed by either of 2 response terms with probabilities varying from 1.0-0.0 to .5-.5 in steps of .1. Distribution conditions for the 3 groups were as follows for intervals between stimulus and stimulus-response and between trials, respectively: 0 sec., 2 sec.; 0 sec., 8 sec.; and 2 sec., 8 sec. Acquisition of the higher probability response was faster for longer intervals but asymptotic performance was not affected. Effect of distribution was greater for probability conditions which approached .5. Results were related to previous probabilistic verbal experiments and Underwood's theory of distribution of practice.—*B. J. House.*

4385. Underwood, Benton J., Rehula, Robert, & Keppel, Geoffrey. (Northwestern U.) **Item-selection in paired-associate learning.** *Amer. J. Psy-*

chol., 1962, 75(3), 353-371.—The learning of a list of paired-associates may be divided logically into 2 stages, 1st response-learning and 2nd association between stimulus and response. Some recent studies have purported to demonstrate that the associative stage takes place in a single trial. 5 major and 2 minor experiments were carried out to evaluate item selection. One indicated that when response-learning was a major factor the "drop-out procedure" resulted in slower learning than the constant procedure. Additional experiments used letter-number pairs, for which response-learning is minimal. In these, the "drop-out procedure" also resulted in slower learning. Results do not deny one-trial learning but strongly indicate that the method used to infer it is inadequate.—*R. D. Nance.*

4386. Voss, James F. (Coll. Wooster) **R₂ competition in S-R₁, S-R₂ verbal probability acquisition.** *Psychol. Rep.*, 1962, 10, 675-678.—"Six one stimulus-two response word associations were presented for 120 trials where probability of the two response words for each stimulus word varied from 1.0-0.0 to .5-.0 in steps of .1. The competing response was varied by: (1) presentation of an E₂ response word on all no-E₁ trials, (2) presentation of an E₂ response word on ½ of all no-E₁ trials, (3) presentation of no E₂ words on all no-E₁ trials. The results indicated that A₁ response frequency increased as probability of E₂ decreased. In addition, the asymptotic performance indicated little difference in A₁ response frequency as a function of E₁ probability for the no-E₂ group."—*B. J. House.*

4387. Waugh, Nancy C. (Harvard U.) **Length of series and the learning curve.** *Amer. J. Psychol.*, 1962, 75(2), 177-192.—Most verbal learning experiments investigate (a) number of trials to mastery as a function of number of items or (b) number of items learned as a function of the number of exposures. This study examines the relation between these 2 functions for serial learning of simple material; it indicates how both may be estimated from first-trial results. In 2 experiments Ss recited lists of digits after each of 6 exposures. All Ss were college graduates. The basic hypothesis was "that the probabilities that a person will learn 0, 1, 2, . . . or k new items from a list are constant from trial to trial and combine independently on successive trials." Both experiments supported the hypothesis. Up to the point where S could master an entire list, each exposure added a constant number of new items to those he could already recall. Up to this point total number of items recalled increased linearly with number of trials. Thus, the learning curve is independent of list number and is linear. The length-difficulty function must also be linear.—*R. D. Nance.*

4388. Williams, Joanna P. (Yale U.) **A test of the all-or-none hypothesis for verbal learning.** *J. exp. Psychol.*, 1962, 64(2), 158-165.—Using simple paired-associate learning materials, one of the assumptions of the all-or-none model, that the mean probability of initial recall is constant, over an extended number of trials, was tested. The all-or-none position was also evaluated in the light of a continuous measure of learning, response latency. The probability of responding correctly to an item for the first time increased as a function of trials using both a recall criterion and in terms of latency. This, and

other findings, were interpreted as supporting a strength theory such as proposed by Hull or Spence.—*J. Arbit.*

Reinforcement (Including Probability Learning)

4389. **Champion, R. A., & McBride, D. A.** (U. Sydney) **Activity during delay of reinforcement in human learning.** *J. exp. Psychol.*, 1962, 63(6), 589-592.—"With speed of response as a measure it was found that both delay of reinforcement and activity during delay had detrimental effects in a very simple learning situation with human Ss. This result confirmed data from a similar study using rats and was interpreted as further supporting Spence's (1956) hypothesis about delay effects in terms of competing responses. Experiments on delay of knowledge of results in human motor learning, yielding no such effects, were seen to differ in certain basic respects from the present type of study."—*J. Arbit.*

4390. **Derks, Peter L.** (U. Pennsylvania) **The generality of the "conditioning axiom" in human binary prediction.** *J. exp. Psychol.*, 1962, 63(6), 538-545.—"The generality of the conditioning axiom basic to linear learning models was investigated. 90 Ss in groups of 10 predicted a 250-trial 75:25 schedule under various conditions of temporal duration, incentive, contingency, and experience with the schedule. During this time the prediction of the more frequent event as a function of its successive occurrence did not show the monotonically increasing function asserted by the conditioning axiom. Further trials showed the monotonic increase but as a result of the differential rate at which Ss began to predict long runs of the more frequent event and decreased the prediction of repetitions of the less frequent event. Concluded that the assertion of the conditioning axiom does not describe most human binary prediction. (31 ref.)—*J. Arbit.*

4391. **Holden, Kenneth B., & Rotter, Julian B.** (Ohio State U.) **Supplementary report: A non-verbal measure of extinction in skill and chance situations.** *J. exp. Psychol.*, 1962, 63(5), 519-520.—"A previous study showed that partial reinforcement does not lead to more resistance to extinction than 100% reinforcement if S feels that reinforcements are produced as a consequence of his own skill. This study also employed verbal expectancies as a measure of learning and extinction. The present study expands the generality of this finding by using a non-verbal behavior. The same effects of skill and chance instructions were found with the nonverbal response. There is also a sex difference in the effects of the instructions.—*J. Arbit.*

4392. **Kanfer, Frederick H., Bradley, Marcia M., & Marston, Albert R.** (Purdue U.) **Self-reinforcement as a function of degree of learning.** *Psychol. Rep.*, 1962, 10, 885-886.—"Ss [80 undergraduates] learned a discrimination task in 25 or 50 trials. Half of each group then received 20 self-reinforcement (SR) trials in which S took over E's control over administration of the reinforcing stimulus. The number of correct self-reinforcing responses was significantly higher with longer acquisition, and both types of incorrect self-reinforcement (failure to reinforce and reinforcing of incorrect responses) were lower with shorter training. The accuracy of

SR responses was related to amount of learning."—*B. J. House.*

4393. **Kanfer, Frederick H., & Marston, Albert R.** (Purdue U.) **Control of verbal behavior by multiple schedules.** *Psychol. Rep.*, 1962, 10, 703-710.—"Twelve Ss participated in a verbal operant conditioning procedure for seven days. They were reinforced for emission of words in the class living animals. One group was trained mainly under fixed interval procedures, a second group under fixed ratio procedures, and a third group on a combination of these two for the first four days. All Ss were then shifted to alternating periods of FR 10 and FI 150 'LH 30' crf. On Day 7 all Ss were also given 20 min. of extinction. . . . Ss trained under FR had a generally higher rate of response and . . . lower variation in response to the S^Ds associated with different schedules than the other groups. Ss started on FI training showed a sharper discrimination of the S^Ds associated with schedules but their overall response rate was lower. The groups trained under mixed schedules performed better under FR than the FI group and showed some rate differentiation between the reinforced and the non-reinforced intervals in FI. All of the groups showed a significant decrease in response rate during extinction but extinction rates did not differ among the groups."—*B. J. House.*

4394. **McCracken, J., Osterhout, C., & Voss, James F.** (Coll. Wooster) **Effects of instructions in probability learning.** *J. exp. Psychol.*, 1962, 64(3), 267-271.—"Instructions in two 70-30 non-contingent probability experiments were varied for six groups. Groups 1 to 6 were told to consider the tasks as (a) conversation, (b) event prediction, (c) event prediction—with additional task information, (d) event prediction—avoiding a trial-by-trial basis of responding, (e) a problem involving responding for blocks of 20 trials, and (f) a problem involving the discrimination of the two events. Group 1 responded at an approximate 50% A₁ level, Groups 2 and 3 approximately matched, and groups 4, 5, and 6 exceeded 85% A₁ responding. Analysis of negative recency effects for Groups 1-4 suggested that Groups 1 and 4 were not responding to the sequential nature of the task, whereas Groups 2 and 3 were."—*J. Arbit.*

4395. **Taylor, A., & Noble, C. E.** (Montana State U.) **Acquisition and extinction phenomena in human trial-and-error learning under different schedules of reinforcing feedback.** *Percept. mot. Skills*, 1962, 15(1), 31-44.—"Effects of different percentages of reinforcing feedback on a 4-unit trial-and-error learning sequence in man were studied for acquisition and extinction. During acquisition there were significant differences and interaction among groups, proficiency being directly related to the number of reinforced responses. During extinction significant differences and interaction were obtained for the 1st 8 nonreinforced trials, but there were no differences among the partial groups themselves. During the remainder of extinction the continuous group recovered and approached the level of the partial groups.—*W. H. Guertin.*

4396. **Wright, John C.** (Stanford U.) **Consistency and complexity of response sequences as a function of schedules of noncontingent reward.** *J. exp. Psychol.*, 1962, 63(6), 601-609.—"80 Ss were instructed that their responses on a circular array of

pushbuttons determined whether a reward or non-reward would occur. Reward occurrence was pre-programmed and random with the independent variable the relative frequency of reward. Superstitious response preferences and patterns were established as a function of the probability of reward, but rotational sequences for the systematic testing of responses were also established as orderly scanning rules, especially following nonreward. The author distinguishes between collecting and using information in that they are differentially influenced by the uncertainty of outcome and the probability of reward.—*J. Arbitt.*

Learning Theory

4397. Jones, M. B. (USN School Aviation Medicine, Pensacola, Fla.) Practice as a process of simplification. *USN Sch. Aviat. Med. res. Rep.*, 1961, Proj. MR005.13-5001, Subtask 11, Rep. No. 2, ii, 18 p.—Correlations between successive trials in the practice of a psychomotor task are strongest between neighboring trials and grow progressively weaker as the trials are more and more separated in the practice series. 3 theories, any one of which can explain these results, are considered, and arguments presented that the most likely interpretation on existing evidence is that the abilities required in successive stages of practice become progressively fewer as one trial follows another. In the beginning many abilities are involved, including several which are fairly general in their application; but at the end of practice only a few are left, for the most part abilities which have a relatively narrow range of application.—*USN SAM.*

4398. Simonov, P. V. (Inst. Higher Nervous Activity, USSR Acad. Sciences) O mekhanizme ugasheniia uslovnykh reflektov. [Mechanism of extinction of CR.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 248-256.—A search for a general explanation of the extinguishing process in conditioning. The hypothesis of the "preventive inhibition" is presented and discussed. This inhibition emerges under the influence of weak stimuli or following a repetition of strong stimuli. It is connected with Pavlov's idea of the defensive and compensatory function of inhibition.—*A. Cuk.*

RETENTION & FORGETTING

4399. Capretta, Patrick J., & Berkun, Mitchell M. (Miami U.) Validity and reliability of certain measures of psychological stress. *Psychol. Rep.*, 1962, 10, 875-878.—200 Army recruits were tested for backward digit memory span in the middle of a rope bridge, and either before or after crossing the bridge. For experimental Ss the bridge crossed a 50-ft. ravine while control Ss were 1 ft. above ground. A significant decrement in middle-of-bridge performance was found for naive experimental Ss, though not for Ss with previous bridge experience or for control Ss. On a Subjective Stress scale given just after bridge crossing, naive Ss showed significantly higher stress scores than experienced Ss, but both groups were significantly above the control group. Stress conditions showed no effect on other psychomotor tasks given after bridge crossing.—*B. J. House.*

4400. Carran, Archie B. (Beloit Coll.) Increasing probability of initial recall with additional

practice. *Amer. J. Psychol.*, 1962, 75(3), 466-469.—Ss were 40 volunteers from introductory psychology. The 20 in the experimental group were given a 2nd trial with paired associates missed on a 1st trial. The proportion of repeated paired items recalled on the 2nd trial "exceeded the proportion of paired items correctly recalled (a) on the first trial, and (b) when the same paired items missed by the experimental Ss were given to control Ss on their second trial only." "One-trial" acquisition of paired associates may be only a special case of gradual initial acquisition.—*R. D. Nance.*

4401. Eysenck, H. J., & Willett, R. A. (U. London, England) Cue utilization as a function of drive: An experimental study. *Percept. mot. Skills*, 1962, 15(1), 229-230.—High-drive and low-drive Ss were given a perceptual-motor task which made demands on their ability to utilize cues. The results bore out Easterbrook's rule according to which higher drive makes cue utilization less efficient. No differences in reminiscence were observed between high-drive and low-drive groups, a finding opposed to theoretical deduction and previous empirical findings with other tasks.—*W. H. Guertin.*

4402. Gardner, R. W., & Lohrenz, L. J. (Menninger Found.) Association and recall. *Percept. mot. Skills*, 1962, 15(1), 29-30.—51 Ss heard a list of words associated with cheese and control words following 5 subliminal exposures to the cheese list. 44 controls heard the list without subliminal stimulation. Both groups recalled more cheese associates than control words, apparently due to the common associative link of the cheese words rather than because of subliminal influence.—*W. H. Guertin.*

4403. Harcum, E. R. (Coll. William & Mary) Recognition vs. recall of tachistoscopic patterns. *Percept. mot. Skills*, 1962, 15(1), 238.—Fewer overall errors and a smaller difference in errors between target-halves were found with aided recall. Although aided recall probably did not completely eliminate a directional-bias in responding, these results suggest that sequential reproduction in recall contributes to, but does not cause, differences in perceptual accuracy between hemifields.—*W. H. Guertin.*

4404. Kahn, Samuel. Thanks for a better memory. New York: Vantage, 1962. 176 p. \$3.00.—A popular presentation of "tested and proved methods for developing a better memory."—*C. T. Morgan.*

4405. Mechanic, Arnold. (U. California, Berkeley) The distribution of recalled items in simultaneous intentional and incidental learning. *J. exp. Psychol.*, 1962, 63(6), 593-600.—Ss were exposed to 2 sets of materials, instructed to learn only 1 of the sets, and were tested later for the set which they were not instructed to learn. The meaningfulness of the incidental items was a significant source of variance, although the meaningfulness of the intentional items itself or in interaction was not significant in incidental learning. Also, incidental learning increased as a function of practice. Using a difference score between intentional and incidental learning for each S, it was predicted that differences would be greater when the items were of low rather than high meaningfulness. In other situations this finding has been explained in terms of a differential response hypothesis. Results of this study support such an hypothesis.—*J. Arbitt.*

4406. Nickerson, Raymond S., & Brown, Charles R. A quasi-random sequence for memory experiments. *USAF ESD tech. docum. Rep.*, 1961, No. 61-55. ii, 8 p.—A method is presented for constructing sequences with properties which make them useful in ordering stimuli for recognition memory experiments. A main feature of the method is the facility for controlling and efficiently manipulating the number of items occurring between the initial and subsequent occurrences of given items.—*USAF ESD*.
4407. Renner, K. Edward, & Maher, Brendan A. (U. Pennsylvania) Effect of construct type on recall. *J. indiv. Psychol.*, 1962, 18(2), 177-179.—Role Construct Test data from 100 undergraduates failed to support either the hypothesis that (a) the more constructs available, the more accurately one can recall material; (b) more accurate recall occurs with material which is similar to one's construct dimensions rather than with dissimilar material. Bartlett's "schema" and Kelly's "construct" are strikingly similar, except that Kelly has extended Bartlett's notion to the realm of personal constructs.—A. R. Howard.
4408. Rothkopf, Ernst Z. (Bell Telephone Labs.) Learning from written sentences: Effects of order of presentation on retention. *Psychol. Rep.*, 1962, 10, 667-674.—Human Ss (N=144) were exposed to 3 informative passages of 12 topically related sentences each and tested for retention 1 or 15 min. later. Retention test items were constructed by deleting one or more consecutive terms from each original sentence and asking S to supply the missing term. Order of presentation of sentences and of retention test items was varied according to a 12 × 12 Latin square design so that each sentence appeared once in each serial position. Order of presentation of sentences had no effect on retention. However, performance was better for test items appearing early in the series of retention test items. Performance was better when the deleted term was located near the end of the sentence than near the beginning for difficult but not for easy terms.—B. J. House.
4409. Schwartz, Fred, & Lippmann, Frances. (Austen Riggs Cent.) Cognitive and associative structures in recall. *Psychol. Rep.*, 1962, 11(1), 91-101.—Ss (N=154) were tested for immediate memory of 24 nouns embedded in six sentences. Three levels of sentence coherence and two instructions were used; the instructions directed Ss to learn the nouns or to learn the sentences. The results show that Ss remembered the sentences as units, facilitating recall, and tended to forget the sentences as units also. A reciprocal relationship was found between associative and sentence structure determinants of recall. The results were discussed in terms of the facilitating effects of organizational structures in memory and in terms of interference generated by competing modes of organization.—B. J. House.
4410. Schwartz, F., & Rouse, R. O. The activation and recovery of associations. *Psychol. Issues*, 1961, 3(Whole No. 9), 140 p.—Clinical and experimental observations show that when a word is heard or seen, associations of that word are activated (primed). This association halo is usually not in awareness according to the psychoanalytic theory of attention cathexis. In presenting associates of primed stimuli on a recognition test, it was shown that recognition errors were not arbitrary but determined by associative relationships. It may be that performance improves because primed associates fall below threshold earlier than primed stimuli. Some primed associations can replace their activating stimuli in retention testing. Many different structures are activated when a stimulus is presented for remembering. The term "set" refers to the priming of a hierarchy of stimulus, associative, cognitive, and motivational structures, whereas the terms priming and associative priming refer to specific levels of this hierarchy.—D. Prager.
4411. Slamecka, Norman J. (U. Vermont) Retention of connected discourse as a function of duration of interpolated learning. *J. exp. Psychol.*, 1962, 63(5), 480-486.—In 3 separate experiments employing college students it was found that retention was inversely related to the degree of interpolated learning as well as amount of interpolated learning. "It was concluded that the rote retention of passages of connected discourse subjected to interpolated interference is solely a function of the amount of time spent on the interfering task, regardless of how that task is structured. The data failed to support notions stressing confusions of list membership at recall, but rather pointed to a nonspecific interference effect for serial materials."—J. Arbit.
4412. Tulving, Endel. (U. Toronto, Canada) The effect of alphabetical subjective organization on memorizing unrelated words. *Canad. J. Psychol.*, 1962, 16(3), 185-191.—Following 3 trials under the same conditions, one group was instructed to organize recall alphabetically while the other continued under instructions to recall as many words as possible. The alphabetical group improved more rapidly and recalled more after 11 trials than did the standard group. Subjective organization is an important determinant in free recall learning.—R. S. Davidson.

THINKING

4413. Farnsworth, Paul R. (Stanford U.) Stereotyped thinking in music. *Music Educators J.*, 1961, 48(1), 101-103.—9 examples of stereotyping are described.—P. R. Farnsworth.

4414. Klein, G. S. (New York U.) On inhibition, disinhibition, and "primary process" in thinking. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 179-198. —". . . state of consciousness and the balance of inhibition and disinhibition of functions characterizing it, are crucial in determining the form and content of cognitive behavior." (45 ref.)—B. T. Jensen.

4415. Moss, C. S. (National Inst. Mental Health, San Francisco) A mediation theory of symbolism as an aide to the experimental investigation of symbolic behavior. *Psychol. Rec.*, 1962, 12, 75-84.—An attempt to reformulate psychoanalytic terms and hypotheses relevant to symbolism in the form of Osgood's mediation theory. Choice of symbols is the mediational resultant of a drive to express and an anxiety drive (to inhibit) response-produced mediational processes similar to original object. This view is discussed in relation to several experimental studies.—R. J. Seidel.

4416. Shemiakin, F. N. (Ed.) *Myshlenie i rech'*, [Thought and speech.] *Izv. Akad. Pedagog.*

Nauk RSFSR, 1960, No. 113. 227 p.—These transactions of the Institute of Psychology in Moscow are devoted to reports of investigations on (a) the "relation of the verbal and the visual in the transition from sensation to thought" and (b) the mechanisms of speech. The former are devoted to study of the relation of color-naming to the hue itself in the case of children and in the case of tribes whose languages have only recently been reduced to writing; the latter are devoted in the main to the electrophysiological study of the "concealed movements" of the speech apparatus during the solution of different kinds of mental problems. There is included an article devoted to a comparative analysis of the means of auditory communication in monkeys and communication by speech among humans.—*I. D. London.*

Problem Solving

4417. Beilin, Harry, & Horn, Rheba. (Brooklyn Coll.) Transition probability effects in anagram problem solving. *J. exp. Psychol.*, 1962, 63(5), 514-518.—The effect of transition probability of successive letter sequences upon the solution time of word and nonsense anagrams was studied. "Solution time is significantly longer for word anagrams than nonsense anagrams. This difference is not accounted for by transition probability totals from summed trigram frequencies, initial and terminal letter frequencies, or transition probability totals of solution words. Word perseveration effect is offered as a possible explanation of the solution time difference as well as organization effects not accounted for by transition probabilities of successive letter arrangement."—*J. Arbit.*

4418. Mayzner, M. S., & Tresselt, M. E. (U. Southern California) Anagram solution times: A function of word transition probabilities. *J. exp. Psychol.*, 1962, 63(5), 510-513.—"A study was made of the effect of word transition probability on anagram solution times. Word transition probability was varied by selecting words with either relatively high or low summed digram frequency totals, while holding constant anagram letter order, word frequency, and anagram transition probability variables. The results, predicted on the basis of an S-R mediational model, showed that anagrams whose word solutions have high transition probability totals are solved significantly faster than anagrams whose word solutions have low transition totals."—*J. Arbit.*

4419. Raaheim, K. (U. Bergen, Norway) Problem solving and the awareness of the missing part. *Scand. J. Psychol.*, 1962, 3(3), 129-131.—When university students were asked to solve the so-called Pea Problem with the added instruction of first looking for the missing instrumental part, solutions were not more frequent than without this addition, although the latter may have led to a greater awareness of the reason for choosing the correct line of attack.—*Journal abstract.*

4420. Safren, Miriam A. (Johns Hopkins U.) Associations, sets, and the solution of word problems. *J. exp. Psychol.*, 1962, 64(1), 40-45.—The hypothesis was tested that the category set in anagram solution operates by associative strength between words selected by E as belonging to some common class. It was predicted that anagrams made from organized lists would be solved more quickly

than anagrams made from random lists, and that there would be a decrease in solution time with trials for the organized condition as associations called up by context began to aid Ss in the solution of subsequent problems. The results supported these predictions and thus the present interpretation of the category set. A description of anagram solving as involving recall and free association was advanced to explain the results.—*J. Arbit.*

Concepts

4421. Archer, E. James. (U. Wisconsin) Concept identification as a function of obviousness of relevant and irrelevant information. *J. exp. Psychol.*, 1962, 63(6), 616-620.—"A 2nd orthogonal design replicated four times examined the effect of obviousness of stimulus differences upon concept identification when the manipulated information was either relevant or irrelevant. It had been predicted that there would be an interaction between relevance and obviousness so that performance would be facilitated if the relevant information were obvious; and the reverse would obtain for the irrelevant information. The prediction was supported. An unexpected result indicated that men and women perceived the two forms of squares and parallelograms differently. Men found the task easier when form was relevant rather than irrelevant; and the opposite obtained for women. A post hoc explanation was offered; the differential performance might have been due to the unequal availability of distinctive labels for the forms by the two sexes." The relation of inner speech to problem solving is noted.—*J. Arbit.*

4422. Braley, Loy S. (U. Buffalo) Some conditions influencing the acquisition and utilization of cues. *J. exp. Psychol.*, 1962, 64(1), 62-66.—"A three-stage concept-learning task was used to investigate the effects on subsequent cue utilization of, prior exposure to relevant cues, differences in level of motivation (MA scale), and the shift of a previously positive cue to the status of a negative instance 50% of the time. . . . The results showed no differences on any aspect of the concept-learning task as a function of level of motivation. The introduction of additional (but irrelevant cues), after an initial discrimination has been learned, functions so as to inhibit rather than facilitate the utilization of these cues when they later become the basis for correct discrimination. A previously positive cue retained in a later learning task, where its reinforcement value is negative, facilitates the learning of a new discrimination. Results were discussed as suggesting an interpretation in terms of stimulus novelty."—*J. Arbit.*

4423. Huttenlocher, Janellen. (Harvard U.) Some effects of negative instances on the formation of simple concepts. *Psychol. Rep.*, 1962, 11(1), 35-42.—26 7th-grade boys were tested on a series of 1-dimensional concept formation problems. 2 instances were presented for each problem, the 1st of which eliminated $\frac{1}{2}$ the possible hypotheses and the 2nd of which eliminated all others except for the answer. Poorest performance was observed when 2 negative instances were presented while the best performance occurred with a negative followed by a positive instance. The other 2 possible sequences (+ + and + -) were of about equal effectiveness.

"An interpretation of the problem-solving process involving storage by Ss of initial instances in the form presented to them and study of dimensions that change value on succeeding instances fit the results of the experiment."—B. J. House.

4424. Osipow, Samuel H., & Grooms, Robert R. (Pennsylvania State U.) **On semantic differential resistance to response bias based on stimulus word position.** *Psychol. Rep.*, 1962, 10, 634.—No significant differences in concept ratings were obtained among 3 groups of 24 Ss each who had concepts presented to the left, center, or right of the scales upon which judgment was made.—B. J. House.

4425. Osler, Sonia F., & Weiss, Sandra Raynes. (Goucher Coll.) **Studies in concept attainment: III. Effect of instructions at two levels of intelligence.** *J. exp. Psychol.*, 1962, 63(6), 528-533.—A concept attainment task was presented under general and explicit instructions to Ss 6, 10, and 14 yr. of age, divided into 2 intelligence groups. Under nonspecific instructions, superior intelligence was associated with more effective concept attainment. Under explicit instructions, however, the average intelligence group improved while those of superior intelligence remained unchanged. Thus superior intelligence gave Ss an advantage in the problem finding phase of the task, but not in actual problem solution. Problem solving ability but probably not problem finding ability, increases within the age range studied.—J. Arbit.

4426. Wallach, Lise. (Wellesley Coll.) **The complexity of concept-attainment.** *Amer. J. Psychol.*, 1962, 75(2), 277-283.—Complexity of concept-attainment may depend on the number of cognitive units and structural relations among them. Cognitive units are still not well understood. 60 summer session Cornell University students served as Ss. Materials were 2 sets (Separate and Combined) of 8 cards containing a variety of patterns. 3 different types of problems were used with different Ss. Each S was asked to learn to label a particular set of cards correctly. It was hypothesized (a) that concept formation would be easiest when only one design was relevant and hardest when all 3 designs were relevant, and (b) that variation in difficulty would be greater with cards of the separate set than with those of the combined set. Results supported both hypotheses.—R. D. Nance.

4427. Wickelgren, Wayne A., & Cohen, David H. (U. California, Berkeley) **An artificial language and memory approach to concept attainment.** *Psychol. Rep.*, 1962, 10, 815-827.—20 students were provided with a memory board and a set of symbols with which to record certain kinds of information about the instances of a concept learning task. One group was allowed 12 memory registers, the other 48 registers. "Smaller memory size resulted in more probabilistic inferences, more non-utilization of information, fewer hypotheses, fewer deferred inferences, and greater likelihood of successful attainment. When presented with non-examples as opposed to examples, Ss made fewer deterministic inferences and more incorrect inferences, probabilistic inferences, recordings, and non-utilizations, although the amount of information was equal. Interestingly enough, the most important determinant of task suc-

cess appears to be learning not to use non-examples incorrectly."—B. J. House.

DECISION & INFORMATION THEORY

4428. Broadbent, D. E. **Principes communs à la réaction perceptive et à la décision à caractère intellectuel.** [Common principles in perceptual reactions and to decision-making of an intellectual character.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(2), 145-155.—"In recent years problems of psychophysics and reaction time have begun to be studied using theories put forward to cover complex intellectual decisions. This paper gives an account first of experiments on decisions in which men show a preference for courses of action which gave low probability of success; and the application of theories of decision to the detection of inconspicuous signals, and to reaction time is then discussed."—V. Sanua.

4429. Edwards, Ward. (U. Michigan) **Measures of information based on overlapping counts for studying sequential dependencies.** *Amer. J. Psychol.*, 1962, 75(2), 311-316.—As previously indicated, the degrees of freedom (df) of data matrices based on overlapping counts are far fewer than conventional formulas for calculating df would indicate. Thus, the Miller-Madow correction will seriously overcorrect unless formulas for df take into account "certain equations relating cell-frequencies." Appropriate formulas are presented. Sequences with and without gaps are discussed. Gaps are of 2 kinds, interior and exterior. However, sequences which include gaps are not appropriate for use in calculating estimates of transmitted information.—R. D. Nance.

4430. Galanter, Eugene. (U. Pennsylvania) **The direct measurement of utility and subjective probability.** *Amer. J. Psychol.*, 1962, 75(2), 208-220.—Recent experimental work on choice stresses 1 of 2 general concepts of behavior: (a) learning theory or (b) a conceptualization stemming from the work of economists and others. In the 2nd, a choice is made among alternative courses of action. The concept of subjective probability serves the same purpose for the choice-theorist as does the idea of partial reinforcement in learning theory. In the direct measurement of utility, Ss estimated additional amounts of money needed to double their subjective happiness level. In the measurement of subject probability, Ss estimated the likelihood of occurrence of a list of 10 events. In the prediction of choices between alternatives with uncertain outcomes, Ss attempted to make as much money as possible by selecting from paired events. Results reveal that it is possible to assess directly the utility of money. Also it is possible to scale the likelihood of uncertain events and to use these psychological scale-values to predict the probability of pairwise choice among alternatives with uncertain outcomes.—R. D. Nance.

4431. Hayes, John R. **Human data processing limits in decision making.** *USAF ESD tech. docum. Rep.*, 1962, No. 62-48. iii, 50 p.—4 experiments are described in which Ss were required to choose among alternatives on the basis of 2, 4, 6 or 8 relevant facts. Both decision quality and decision time were measured. Presenting more than 4 facts caused a decrease in decision making efficiency.—USAF ESD.

4432. Kay, Harry. (Sheffield U.) Channel capacity and skilled performance. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 161-169.—2 different experiments are discussed with the aim of trying to make some estimation of the informational capacity of the human perceptual-motor system. One concerns the capacity of the human motor system in assembly-type operations, while the other concerns short-term memory and its bearing on perceptual motor skills.—G. H. Mowbray.

4433. Novik, I. B. Negéntropiia i kolichestvo informatsii. [Negentropy and quantity of information.] *Vop. Filos.*, 1962, 16(6), 118-128.—In order to develop information theory further, it is necessary to effectuate a transition from the concept of "quantity of information" to a concept of "information as such." The latter concept is developed on the basis of Lenin's "theory of reflection." In this way information may be regarded as "regulated reflection" of objective reality in man's consciousness.—I. D. London.

4434. Shaliutin, S. M. Algoritmy i vozmozhnosti kibernetiki. [Algorithms and the possibilities of cybernetics.] *Vop. Filos.*, 1962, 16(6), 163-170.—The author concludes that the large number of unsolved problems, connected with viewing the brain as a processor of information, does not permit one, as of now, to demonstrate the "superiority of man's brain over the machine."—I. D. London.

4435. Wilcott, R. C. (Western Reserve U.) Palmar skin sweating vs. palmar skin resistance and skin potential. *J. comp. physiol. Psychol.*, 1962, 55(3), 327-331.—The relationship of palmar skin sweating to skin resistance and potential was studied in 75 people. Within Ss, the amplitude of sweating correlated highly with resistance and potential responses; between Ss, potential change correlated with sweating, but resistance responses did not. Sweating response latencies averaged 1.1 sec. longer than resistance response latencies, and were approximately equal to the latency of the positive wave of the potential response.—W. A. Wilson, Jr.

PHYSIOLOGICAL PSYCHOLOGY

4436. Anokhin, P. K. (Sechenov Medical Inst., Moscow, USSR) Refleks tseli kak ob'ekt fiziologicheskogo analiza. [Goal-seeking reflex as object of physiological analysis.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 7-21.—The problem of the purposive reflex was raised by Pavlov as early as 1916. The author discusses its physiological basis in the light of some data on hunger and thirst and in the light of his own theory on the feedback mechanism called "the action receiver." The conclusion is drawn that the last explanation of the goal-seeking reflex is to be found in the functioning of the hypothalamus and of the reticular formation.—A. Cuk.

4437. Asratian, E. A. (Inst. Higher Nervous Activity & Neurophysiology, USSR Acad. Sciences) O meste obrazovaniia i funktsional'nykh osnovakh uslovnoi svyazi. [The place of formation and the functional bases of conditioned connections.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 371-378.—3 questions are pertinent: (a) Where does the CR take place? (b) What shifts in the functional state of nervous centers underlie the formation of a CR?

(c) What structural changes in the neurons constitute the material pattern of the conditioned connections? Pavlov's answers and views have either been further confirmed (regarding the cortex as the locus and the organ of conditioning and the role of the rise in excitability of paired "foci") or are the most probable hypothesis (the shifts of the synaptic apparatus as the material basis of the CR).—A. Cuk.

4438. Belenkov, N. IU. (Medical Inst., Gor'kii, USSR) Spornye voprosy struktury interotseptivnykh uslovnykh refleksov. [Controversial problems concerning the structure of interoceptive CR.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 418-425.—It is known that the interoceptors are represented in the cortex although to a lesser degree than the exteroceptors. Are they a cortical or subcortical affair? The experimental evidence is in favor of a subcortical explanation although a certain role of the cortex cannot be denied. A strong position is assumed against the explanation proposed by Chernigovskii and Airapet'iants in terms of "scattered elements of analyzers" which may account for the formation of interoceptor CR in the case of cortical extirpation. There is no evidence for such a hypothesis.—A. Cuk.

4439. Deutsch, J. A. (Stanford U.) Higher nervous function: The physiological bases of memory. *Annu. Rev. Physiol.*, 1962, 24, 259-286.—A review of some of the physiological aspects of memory. Material is discussed in terms of: retrograde amnesia and consolidation of the memory trace, consolidation hypothesis, epileptiform phenomena and learning, nature of the physiological change in learning, interocular transfer and storage of the memory trace, steady potential shifts and learning-like phenomena, and electrical activity of the brain and its relation to the memory trace. (97 ref.)—M. J. Wayner, Jr.

4440. Hebb, Donald Olding. The organization of behavior; A neurophysiological theory. New York: Basic Books, 1961. 335 p. \$1.95 (paper).—A paperback edition of the 1949 book.—E. Y. Borrouman.

4441. Levi-Montalcini, R., & Angeletti, P. U. (Washington U., St. Louis) Growth and differentiation. *Annu. Rev. Physiol.*, 1962, 24, 11-56.—The material is divided into 2 parts: (a) primitive organisms, isolated cells, cell populations, and embryonic induction and (b) chemical aspects of growth and differentiation. The survey was completed in June 1961. (357 ref.)—M. J. Wayner, Jr.

4442. Levin, S. L. (Psychoneurological Inst., Odessa, USSR) Spornye voprosy ucheniia o bezuslovnorefleksnoi deiatel'nosti kory bol'shikh polusharii cheloveka i zhivotnykh. [Controversial problems in the teaching of the UR activity of the cerebral cortex of man and animals.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 44-53.—On the basis of experimental data obtained by the author and by others, some accepted and some controversial points in the theory of the UR activity are discussed. Some debatable points are: (a) presence or absence of an intersected supernuclear neuron connected with the bulbar salivatory center, (b) role of this neuron, and (c) mechanism of secretory suppression in cases of decortication.—A. Cuk.

4443. Mackay, Roland P. (Northwestern U. Medical School) **A neurologic theory of the neuroses.** *Neurology*, 1962, 12(10), 657-664.—“... behavior is the ultimate business of neurology. . . . But if the neurologists, as scientists, are dissatisfied with the mystique of ‘dynamic psychiatry,’ its fanciful symbolism, its reification of abstractions . . . the neurologist must ‘put up or shut up.’” The author’s theory of the neurological basis of neuroses is based on the conditioned reflex; he cites 3 major types of neuroses, all produced by the child’s early conditioning: (a) conditioned misbehavior, e.g., hysteria (conditioned deceit); (b) conditioned alarm neuroses, “a habitual attitude of anxiety . . . termed character neuroses”; (c) “episodic variety of anxiety [which] arises from the breakdown of naturally acquired conditioned patterns of behavior when impossible choices or decisions become necessary . . . termed conflict neuroses.” Such a theory of the physiology of neuroses is amenable to experimental verification “without recourse to mystical abstractions, the supposition of strange forces in the personality, or the use of fanciful symbolism.”—R. Gunter.

4444. MacLean, Paul D. (National Inst. Mental Health, Bethesda, Md.) **New finding relevant to the evolution of psychosexual functions of the brain.** *J. nerv. ment. Dis.*, 1962, 135(4), 289-301.—New findings on the representation of sexual functions on the lower mammalian brain are first presented as they throw light on “the primitive interplay of oral, aggressive and sexual behavior.” Naturalistic observations on the sociosexual behavior of squirrel monkeys are then considered and their implications concerning the psychosexual functions of the brain.—N. H. Pronko.

4445. Smith, Aaron. (Seton Hall Coll. Medicine, Jersey City, N. J.) **Ambiguities in concepts and studies of “brain damage” and “organicity.”** *J. nerv. ment. Dis.*, 1962, 135(4), 311-326.—Despite marked advances in neurology and psychology in the last century, little is known of the brain mechanisms involved in the “higher” mental functions. Clinical and experimental studies are discussed and shown to point to a “need to develop new contexts for studying and defining mental functions and brain mechanisms.”—N. H. Pronko.

4446. Usov, V. V. **O statisticheskikh svoystvakh élektroéntsefalogrammy i élektrokortikogrammy.** [On the statistical properties of the electroencephalogram and electrocorticogram.] *Biofizika*, 1962, 7(5), 629-632.—The author discusses the distributions of momentary values of biopotentials, the mutual regression and autocorrelational connections of the electroencephalogram, and electrocorticogram.—I. D. London.

NEUROANATOMY & PHYSIOLOGY

4447. Courville, Jacques; Walsh, John, & Cordeau, J. Pierre. (U. Montreal, Canada) **Functional organization of the brain stem reticular formation and sensory input.** *Science*, 1962, 138(Whole No. 3544), 973-975.—Injection of 20 μ g of adrenaline, dissolved in 10 μ l of tyrode solution, directly into the brain stem reticular formation, are followed by a transient increase in the amplitude of the cortical-evoked response obtained from single-shock stimulation of the optic chiasma, while injections of the

same amount of acetylcholine produce a transient decrease. Furthermore, injections of procaine in the medial region of the rostral pontine reticular formation are followed by a long-lasting increase in the amplitude of these evoked responses, while the same injections at mesencephalic levels produce a marked decrease. These findings are interpreted in terms of the presence, in the reticular formation, of 2 antagonistic ascending systems: one adrenergic, the other cholinergic, whose tonic activity originates in the mesencephalic tegmentum in one case and in the caudal regions of the brain stem in the other.—*Journal abstract.*

4448. Gromakovskaya, M. M. (Inst. Biological Physics, Acad. Sciences, USSR) **K voprosu o mekhanizme diystviya serotoninina na robotosposobnost' nervno-myshechnogo apparata.** [On the question of the mechanism of the action of serotonin on the work capacity of the neural muscular apparatus.] *Dokl. Akad. Nauk SSSR*, 1962, 144(1), 238-241.—The present study investigated the mechanism of the increase of contractions of fatigued muscles under introduction of serotonin. Such action cannot be attributed to central effects since suboccipital injections do not have a stimulating effect. Peripherally the effect could be due to an increase of the contractability of the muscle fibers or change in the functional state of the myoneural synapses. Experiments were done using frogs and fatiguing the sural muscles by condensor discharge stimulation of the sciatic nerve at a rate of 60-70 impulses/minute. The locus of the effect of serotonin was inferred by intravenally injecting 0.2-0.25 γ of this material after a 1-15 mg. dose of nobutan. Nobutan at that dosage blocks neural transmission but leaves muscle contractability unaffected. Since serotonin has no effect when so combined with nobutan the inference is made that the locus of effect is the synapse. Other experiments combining injections of serotonin and anticholinesterase substances support this conclusion.—H. Pick.

4449. Sherer, Georgia, & Pribram, Karl H. (Stanford U.) **Serial frozen section of whole brain.** *Psychol. Rep.*, 1962, 11(1), 209-210.—“A technique for making serial sections of whole monkey brains is reported. This technique allows a saving of months over the usual celloidin imbedding procedure when reconstructions of lesions or electrode implantations are needed. The technique speeds the reporting of neurobehavioral experiments.”—B. J. House.

4450. Zanchetti, A. (U. Siena, Italy) **Somatic functions of the nervous system.** *Annu. Rev. Physiol.*, 1962, 24, 287-324.—Literature is reviewed and organized in terms of the following major topics: specific and unspecific sensory mechanisms, significance of electrical cortical activity, and reticular formation. The survey was completed in June 1961. (342 ref.)—M. J. Wayner, Jr.

LESIONS & BEHAVIOR

4451. Ebner, Ford F., & Myers, Ronald E. (Johns Hopkins U. School Medicine) **Corpus callosum and the interhemispheric transmission of tactual learning.** *J. Neurophysiol.*, 1962, 25(3), 380-391.—“Nine normal monkeys and 8 with corpus callosum and anterior commissure sectioned were studied for transfer of training between the hands

and between the feet. The normal animals recognized almost immediately with one hand tasks learned with the other hand. They failed, however, in such immediate recognition on tests with a second foot but exhibited more rapid relearning through this foot than through the first foot. By contrast, animals with their commissures sectioned failed to exhibit any evidence of cross-recognition between the hands or between the feet of 1) a simple bar-pressing behavior, 2) a warm-cold discrimination response, and 3) a more complex, tactual form discrimination response. The concept that section of the corpus callosum depresses rates of learning through the separate body members received no support from the present study."—G. Westheimer.

4452. Ettlinger, G., & Kalsbeck, J. E. (Inst. Neurology, Queen's Square, London, England) **Changes in tactile discrimination and in visual reaching after successive and simultaneous bilateral posterior parietal ablations in the monkey.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 256-268.—8 animals were subjected to successive right-left or left-right posterior parietal ablation with interoperative testing, the same areas were removed bilaterally in 3 animals, and 3 underwent anterior parietal ablations. "It was found that with unilateral removals both visual and tactile placing reactions were absent or diminished in the contralateral limbs; performance with the left hand on both the test of tactile shape discrimination and visual reaching was significantly more impaired following contralateral than ipsilateral posterior parietal removals; neither first nor second ipsilateral removals gave rise to unequivocal impairment on these tests; and the impairment of shape discrimination and reaching with the left hand following one-stage bilateral posterior parietal removals was no greater than that following unilateral right-sided removals. These results indicate that defects of placing, tactile shape discrimination, and reaching associated with posterior parietal ablations in the monkeys are predominantly crossed, and suggest that there exists a measure of independence between the hemispheres in the control of these activities. It is also argued that the disorder of reaching is the result of a central loss of position sense."—M. L. Simmel.

4453. Gavrilova, L. N., & Obukhova, G. P. (Inst. Experimental Medicine, USSR Acad. Medical Sciences) **Vliianie aminazina na reflektornuiu deiatel'nost' sobak s odnostoronnie udalennym zritel'nym bugrom.** [Effect of chlorpromazine on the reflex activity of dogs with unilaterally removed optical thalamus.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 285-289.—Food and acid CRs were elaborated in 3 dogs whose optic thalamus had been previously removed. Salivation was recorded simultaneously from the left and right parotid gland. Chlorpromazine in doses of 1, .5, and .25 mg. per 1 kg. of animal's weight was administered 50 minutes before the experiment. The drug exercised a selective depressing influence on the acid reflex while leaving the food UR unchanged. A greater decrease in acid reflexes was recorded on the operated side than on the intact one.—A. Cuk.

4454. Hara, Kazuo. (International Christian U., Tokyo, Japan) **Visual defects resulting from pre-striate cortical lesions in cats.** *J. comp. physiol.*

Psychol., 1962, 55(3), 293-298.—Cats were tested before and after lesions of the middle suprasylvian gyrus, and compared to nonoperative controls, on thresholds for brightness, size, and form discrimination. The lesions caused (a) essentially no effect on brightness, (b) a moderate and temporary increase in size threshold, and (c) a marked, persistent increase in the form-discrimination threshold. Postoperative learning of umweg problems was also impaired. "... pre-striate lesions selectively impair visual form discriminations and retard the solution of new visual learning tasks ... without apparent effect on trans-operative retention."—W. A. Wilson, Jr.

4455. Isaacson, R. L., & Wickelgren, W. O. (U. Michigan) **Hippocampal ablation and passive avoidance.** *Science*, 1962, 138(Whole No. 3545), 1104-1106.—6 rats with bilateral ablation of the hippocampus and 6 rats with extensive destruction of the neocortex were trained to enter a small compartment, while hungry, for a food reward. After 35 trials, spread over 4 days of training, the animals were given a shock while they were eating in the goal box. After the shock the rats with cortical lesions would not enter the goal compartment on the remainder of the trials given on the same day and only gradually began to re-enter over the next 2 days. The effect of the shock on the Ss with hippocampal ablation was slight and transient, suggesting that the ability to make passive avoidance response was impaired.—*Journal abstract.*

4456. Kim, Chul, & Kim, Chang Uk. (Seoul National U., Korea) **Effect of hippocampal ablation on audiogenic seizure in rats.** *J. comp. physiol. Psychol.*, 1962, 55(3), 288-292.—Rats in which the hippocampus was ablated through the overlying neocortex showed an increased susceptibility to audiogenic seizures, chiefly in response to a weak sound; rats in which only the overlying neocortex was destroyed also showed an increase in seizures, but only to a more intense sound.—W. A. Wilson, Jr.

4457. Kovalenko, V. N. (Brain Inst., USSR Acad. Medical Sciences) **Vliianie dvukhstoronnego razrusheniia orbital'noi i perednei sil'vievoi izviliny mozga na pishchevye (sekretno-dvigatel'nye) uslovnye refleksy u sobak.** [Effect of bilateral destruction of the orbital and anterior Sylvian convolution of the brain on the motor secretory CR in dogs.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 508-516.—CR to sound, light, touch, and to a square were elaborated in 6 dogs before and after the brain operation performed in 2 stages with an interval of 30-40 days. While the UR remained and manifested itself in an intensified form for 15-25 days after the operation, the CR was significantly diminished.—A. Cuk.

4458. Kovalenko, V. N. (Brain Inst., USSR Acad. Medical Sciences) **Vliianie dvukhstoronnego razrusheniia kory orbital'noi i perednei sil'vievoi izviliny mozga sobaki na bezuslovnoe i uslovnoe, aliunootdelenie.** [Effect of bilateral destruction of the orbital and anterior Sylvian gyri of dog's cerebral cortex on unconditioned and conditioned salivation.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 135-144.—Ss were 5 dogs, 4 experimental and 1 control. After the establishment of salivary reflexes, the zone of the cortical representation of the food center was destroyed, first in one hemisphere and, after an interval

of 30-40 days, in the other. Ss were tested for the CR 5-17 days after each operation. The destruction of the zone resulted in a drastic CR drop, an increase in the latency period, and a slower rise of the unconditioned salivation to its maximum. The destruction of an equal amount of the cortex in the parietal zone of the control dog showed a slight decrease in the CR and UR, but both were fully restored 20 days after the operation.—A. Cuk.

4459. Ladpli, R. (U. Wisconsin) **Galvanic skin reactions of chronic spinal cats.** *Amer. J. phys. Med.*, 1962, 41, 15-22.—The threshold and amplitude of the spinal galvanic skin reflex indicate that the spinal sympathetic motoneuron pools act independently after having been released from cortical control. Hyperreflexia was not observed.—H. J. P. Schubert.

4460. Meikle, T. H., Jr., Sechzer, J. A., & Stellar, Eliot. (Medical School, U. Pennsylvania) **Inter-hemispheric transfer of tactile conditioned responses in corpus callosum-sectioned cats.** *J. Neurophysiol.*, 1962, 25(4), 530-543.—"The inter-hemispheric transfer of both a limb flexion response and a respiratory response conditioned to unilateral tactile stimulation was tested in unoperated cats and in cats in which the corpus callosum had been sectioned either before training or during training. Normal, unoperated cats transferred completely both limb flexion and respiratory responses. Cats with inter-training section of the corpus callosum transferred the respiratory response completely without shock reinforcement, but the limb flexion response transferred only partially even after institution of shock reinforcement. Cats with pretraining section of the corpus callosum transferred neither the limb flexion nor the respiratory response when transfer was tested without shock reinforcement. Although rapid re-learning of the respiratory response with great savings was accomplished with shock reinforcement, the limb flexion response failed to demonstrate any transfer and required complete retraining."—G. Westheimer.

4461. Nutsuidze, M. A. (Inst. Physiology, Tbilisi, USSR) **Posledstviia udaleniia orbital'noi poverkhnosti (orbital'noi kory) lobnykh doli u koshek.** [Consequences of removal of the orbital surface (orbital cortex) of the frontal lobes in cats.] *Soobshch. Akad. Grus. SSR*, 1962, 28(6), 717-724.—After removal of the orbital cortex in 8 cats: (a) motor disturbances in feeding appeared, (b) the emotional reactions of fear and rage weakened, (c) conditioned emotional reactions of fear disappeared, (d) active positive emotional reactions disappeared, and (e) spatial orientation remained undisturbed. All changes observed are attributed to postoperative exclusion of the influence of the orbital cortex on the corresponding centers in the hypothalamic field.—I. D. London.

4462. Sikharulidze, N. I. (Tbilisi State U., USSR) **Nekotorye rezul'taty izucheniia chastichnogo i polnogo udaleniia zritel'nogo analizatora u sobak.** [Some results of a study on the partial and complete removal of the visual analyzer in dogs.] *Soobshch. Akad. Grus. SSR*, 1962, 28(6), 725-732.—Automatized feeding behavior in the dog in response to different forms does not disappear with unilateral removal of Fields 18 and 19 of the visual analyzer

and that of Fields 17, 18, and 19. This is true with isolated stimulation of either the ipsilateral or the contralateral eye. The indicated operation has no effect on "spatial visual orientation." Conditioned reflexes to visual stimuli do not disappear with bilateral removal of Fields 18 and 19. In the beginning of the postoperative period differentiation between conditioned stimuli is disturbed, but it is restored after 3-4 weeks. However, delayed reactions remain partially disturbed in that their appearance is considerably quickened. With bilateral removal of Fields 17, 18, and 19, conditioned reflexes to various forms disappear with no restoration by the 7th post-operative month. Spatial orientation, "studied on the basis of visual reception" is also disturbed. With unilateral and bilateral removal of Fields 18 and 19 and that of Fields 17, 18, and 19, both the functions of other receptors and orientation in space "studied on the basis of these receptors" remain normal.—I. D. London.

4463. Sikharulidze, N. I. (Tbilisi State U., USSR) **Nekotorye rezul'taty izucheniia udaleniia 17 polia zritel'nogo analizatora u sobak.** [Some results of a study on removal of Field 17 of the visual analyzer in dogs.] *Soobshch. Akad. Nauk Grus. SSR*, 1962, 28(3), 355-362.—The results of experiments involving unilateral and bilateral removal of Field 17 in the brain of dogs show the following: (a) Automatized differentiated feeding behavior developed by stimulating one eye retains the same characteristics on stimulation of the other eye, from which it is concluded that the conditioned connections responsible for automatization of this behavior are formed in both hemispheres. (b) With unilateral removal of Field 17 of the visual analyzer, automatized feeding behavior in response to various forms do not disappear and spatial orientation remains completely unaffected. (c) With bilateral destruction of Field 17 spatial orientation remains normal, but visual perception is disturbed for a time. Conditioned reflexes to photic stimulation do not disappear, but object-vision remains partially disturbed for a long time.—I. D. London.

4464. Skultety, F. Miles, & Gary, Thomas M. (State U. Iowa) **Experimental hyperphagia in cats following destructive mid-brain lesions.** *Neurology*, 1962, 12(6), 394-401.—The investigation was carried out on 14 adult cats which were given "ad-lib diets" before and after electrolytic lesions of the periaqueductal gray matter beneath the superior colliculus. 7 of the animals became hyperphagic, and 6 remained so until the end of the experimental period. The authors conclude that hyperphagia can be produced in adult cats by "destructive lesions of sufficient quantity of the dorsal periaqueductal gray matter and adjacent tissue" as well as "minimal destructive lesions of the more ventral periaqueductal gray matter and adjacent tissue. . . . In view of the disparate sites of bilateral mesencephalic lesions attended by hyperphagia" as well as in view of the various other anatomical structures reported by other investigators to be involved in hyperphagia, the authors conclude that there must be "a number of destructive lesions of the central nervous system which bring about a disturbance of relationships among structural-functional components which usually . . . result in hyperphagia." The authors further infer that no 1:1 correspondence

exists between an "anatomic center" in the mid-brain and euphagia.—R. Gunter.

4465. Stuart, D. C., Freeman, W. J., & Hemingway, Allan. (U. California, Los Angeles) Effects of decerebration and decortication on shivering in the cat. *Neurology*, 1962, 12(2), 99-107.—7 cats were decerebrated at the intercollicular level; they were found capable of movements (spasmodic jerks and kicks, running motion, and sometimes tremor) in response to rapid body cooling. No significant rise in oxygen consumption during these activities was observed. The authors concluded that "decerebrated cats cannot shiver and that . . . activity must be more rostral than midbrain. . . . For the first few days after surgical removal of the telencephalon, cats were found to be autonomically hyperactive, urinating, defecating, vomiting, and 'raging' excessively. Classically, such hyperactivity is considered a result of removal of the net suppressive influence which the telencephalon is supposed to exert tonically upon the hypothalamus and its subservient functions. However, as measured metabolically, the intensity of shivering was depressed at this stage and did not return to the preoperative level until four weeks after surgery."—R. Gunter.

4466. Tapp, Jack T. (Vanderbilt U.) Reversible cortical depression and avoidance behavior in the rat. *J. comp. physiol. Psychol.*, 1962, 55(3), 306-308.—The behavior of rats in a shuttle box was studied after the application of KCl solutions to the cortex through implanted polyethylene tubes. Increased latency of response was produced, and was a function of the concentration of the KCl; the time required for recovery also increased as a function of concentration. It is suggested that the disruption of avoidance behavior is part of "a general loss in the ability to perform tasks involving integrated motor behavior."—W. A. Wilson, Jr.

4467. Thompson, Richard F. (U. Oregon Medical School) Role of the cerebral cortex in stimulus generalization. *J. comp. physiol. Psychol.*, 1962, 55(3), 279-287.—Cats with total lesions of auditory cortex and normal cats were trained to respond to a 250-cps tone to avoid shock. Sub-groups were then tested for generalization to tones from 500 to 8000 cps. Normals showed a decreasing generalization gradient; operates responded equally to all test frequencies. "It is suggested that removal of auditory cortex prevents the characteristic development of response inhibition, seen in the normal animal, to stimuli other than the training stimulus."—W. A. Wilson, Jr.

4468. Wang, G. H., & Akert, K. (Johns Hopkins Hosp.) Behavior and reflexes of chronic striatal cats. *Arch. Ital. Biol.*, 1962, 100(1), 48-83.—"Observations on behavior and reflexes were made on three thalamic, ten striatal and five semithalamic-semi-striatal cats. . . . The observed differences in behavior and reflexes between the striatal and thalamic cats may be justifiably attributed to the presence of the striatum in the former and its absence in the latter. It is also concluded that the striatum has, independently of the neocortex, its own functions, which may well be (a) inhibition, and (b) maintenance of the proper sequence in the occurrence of the reflexes required in the performance of a particular

act, such as eating, grooming and mating."—C. T. Morgan.

4469. Whittier, John R., & Orr, Alfonso. (Creedmoor State Hosp., N. Y.) Hyperkinesia and other physiologic effects of caudate deficit in the adult albino rat. *Neurology*, 1962, 12(8), 529-539.—A description of behavioral and metabolic consequences of bilateral stereotaxic lesions in caudate tissue in adult albino rats and correlation between these lesions and cursive hyperkinesia. The following variables were studied: body weight, food and H₂O intake, general behavior, activity-drum recording, swimming activity, oxygen consumption, histamine tolerance, blood glucose, sodium and potassium. A total of 180 animals, divided into various groups were studied. The "syndrome of caudate deficit" produced in the adult albino rat is characterized by: (a) transient consummatory failure, (b) persistent ambulatory hyperkinesia, (c) increased histamine tolerance, and (d) disorganization of somatomotor activities. All these phenomena were obtained without motor weakness. Other significant changes were: fasting blood glucose, sodium, and potassium; however, a decrease in O₂ consumption associated with caudate deficit was observed with cortical lesions.—R. Gunter.

BRAIN STIMULATION

Central Stimulation

4470. Blum, Baruch. (Weizmann Inst. Science, Rehovoth, Israel) A method for chronic implantation of depth electrodes in the brains of experimental animals. *EEG clin. Neurophysiol.*, 1962, 14, 552-553.—The present report describes a new method for temporary attachment of electrodes to the stereotaxic manipulator, allowing the chronic implantation to be done accurately, conveniently, and in such a manner to withstand the activities of the awake and even convulsive animal.—L. C. Johnson.

4471. Krasne, Franklin B. (Yale U.) General disruption resulting from electrical stimulus of ventromedial hypothalamus. *Science*, 1962, 138 (Whole No. 3542), 822-823.—Electrical stimulation of the ventromedial nucleus of the hypothalamus caused hungry rats to stop eating. However, control tests showed such stimulation to be potentially noxious and capable of stopping drinking in thirsty rats. Thus the stopping of eating caused by this stimulation may not have been indicative of a primary effect on hunger.—*Journal abstract.*

4472. Sadowski, B., & Longo, V. G. (Istituto Superiore Sanita, Rome) Electroencephalographic and behavioural correlates of an instrumental reward conditioned response in rabbits, a physiological and pharmacological study. *EEG clin. Neurophysiol.*, 1962, 14, 465-476.—Instrumental reward conditioning was used on 8 rabbits in which cortical and subcortical electrodes had been implanted. Behavioral and EEG patterns during the conditioned responses with and without drugs were analyzed. The conditioned stimulus produced the greatest change in the hippocampal lead, an increase in amplitude and frequency. During satiation 2-3 cps. high amplitude waves intermingled with spindles appeared in the anterior cortex. Masticatory waves appeared in the anterior cortex during eating. The

conditioned response was found to be sensitive to cholinergic drugs.—L. C. Johnson.

4473. Valenstein, Elliot S., & Beer, Bernard. (Walter Reed Army Inst. Research, Washington, D. C.) Reinforcing brain stimulation in competition with water reward and shock avoidance. *Science*, 1962, 137 (Whole No. 3535), 1052-1054.—Employing response rate as the index of reinforcing strength in self-stimulation experiments is questioned. With water reward or shock avoidance placed in competition with brain stimulation, self-stimulation rate does not reflect relative reinforcement value. The results agree with preference tests which show that for, a given electrode site, stimulus intensity, not rate, is directly related to reward strength.—*Journal abstract*.

Electroshock

4474. Adams, Henry E., & Lewis, Donald J. (Louisiana State U.) Electroconvulsive shock, retrograde amnesia, and competing responses. *J. comp. physiol. Psychol.*, 1962, 55(3), 299-301.—In original training, all of 48 rats were exposed to a shuttle box, with $\frac{1}{2}$ receiving true avoidance trials; ECS immediately followed this exposure for $\frac{1}{2}$ of each group. 3 days later all Ss received avoidance trials. The ECS not only interfered with retention of a previously learned avoidance response, but also interfered with the learning of an avoidance response 3 days after the ECS. An explanation is offered in terms of competing responses.—W. A. Wilson, Jr.

4475. Adams, Henry E., & Lewis, Donald J. (Louisiana State U.) Retrograde amnesia and competing responses. *J. comp. physiol. Psychol.*, 1962, 55(3), 302-305.—The effects of ECS on avoidance behavior in rats were studied in 2 experiments. A retrograde amnesic effect appeared when ECS was given in the situation in which the response was learned, but not when ECS was given in a different situation. When Ss were repeatedly exposed, without ECS, to the place where ECS had previously been received the amnesic effect was apparently extinguished. An explanation of ECS effects in terms of interference with consolidation is rejected in favor of a competing-responses explanation.—W. A. Wilson, Jr.

4476. Frommel, E., Family, S., & Ledebur, I. V. (Faculté de Médecine, Genève) L'influence de l'effort musculaire sur l'électrocrise chez le cobaye. [The influence of muscular exertion on electroshock in the guinea-pig.] *Encephale*, 1962, 51(3), 232-237.—A series of 20 guinea-pigs were subjected to forced exercise following electroshock. The following modifications were observed: (a) the clonic and "swimming" phases were fused into a complex phase combining characteristics of both, (b) the tonic crisis was shortened, and (c) coma was prolonged. These findings strengthen the hypothesis of depression of convulsion-producing centers and the persistence of conditioned fear reactions, even under loss of consciousness.—W. W. Meissner.

ELECTROENCEPHALOGRAPHY

4477. Adey, W. Ross; Bell, Frederick R., & Dennis, Barbara J. (U. California, Los Angeles) Effects of LSD-25, psilocybin and psilocin on tem-

poral lobe EEG patterns & learned behavior in the cat. *Neurology*, 1962, 12(9), 591-602.—The authors test the hypothesis that one of the important sites of action of psychotomimetic & hallucinogenic drugs may be those regions in the brain that are concerned in recent memory, emotional arousal, and perceptive functions in the auditory and visual modalities. The effects of LSD-25, psilocybin and psilocin on "resting activity" and on learned behavior (T-maze and delayed response) and correlated EEG records were studied in 18 cats with chronically implanted electrodes in amygdala, parts of hippocampus and entorhinal cortex, thalamic nucleus ventralis anterior, rostral midbrain reticular formation, and primary visual cortex. LSD-25 (25-100 μ g.) resulted in "wide-based 'kangaroo' posture with tail extended . . . [as well as] loss of normal affective responses." Increase in LSD-25 dosage resulted in brief seizure-like episodes as seen in EEG records. Maximal amplitude and longest duration were recorded from dorsal hippocampal and entorhinal cortex leads. "These seizures seemed critically dependent on reduction of visual & auditory sensory influences." Further increases in LSD to about μ g. per kilogram resulted in persistence of seizures and disruption of a delayed response performance when the seizure episode encroached on the period when a discriminative performance was required. "Unlike visual and auditory stimuli, ingestion of food during action of LSD-25 was frequently associated with wave and wave and spike seizure activity, confined in some instances to hippocampal & amygdaloid systems."—R. Gunter.

4478. Anokhin, P. K. (First Medical Inst., Moscow, USSR) Novye dannye k kharakteristike spetsifichnosti voskhodiashchikh aktivatsii. [New data on the characteristics of the specificity of ascending activations.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 379-390.—Biological modality of the activation is advanced as the main criterion for the classification of excitations into specific and nonspecific. It has been proved that every biologically specific condition of an animal has its own ascending activating effect which can be blocked by drugs. Experiments are discussed showing an ascending activating influence of the hypothalamus on the frontal areas in a hungry anesthetized cat. If glucose is injected into the blood and milk into the cat's stomach, desynchronization of electrical activity in the frontal lobes changes, even in a sleeping cat, to a weak electrical activity.—A. Cuk.

4479. Berkovitch, T. E. (Moscow Pedagogical Inst., USSR) Izuchenie intensivnosti vnimaniia. Soobshchenie I. Intensivnost' vnimaniia po dannym biotokov mozga pri neprosredstvennom vospriatii razdrzhitel' i pri ikh differentsirovanii. [Intensity of attention. Communication I. Intensity of attention as measured by the EEG in an immediate perception of stimuli and in their discrimination.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 73-76.—Ss were college students aged 17-20. Their EEG and EMG were recorded while Ss were exposed to visual stimuli. In the 1st experimental series no instructions were given to Ss; in the 2nd they were taught to react in a discriminatory way to different stimuli. After each trial the Ss were questioned in detail. A confrontation of the EEG records with the verbal reports shows a relationship between disap-

pearance of alpha waves and intensity of attention.—*A. Cuk.*

4480. Cadell, T. E., Harlow, H. F., & Waisman, H. A. (U. Wisconsin) EEG changes in experimental phenylketonuria. *EEG clin. Neurophysiol.*, 1962, 14, 540-543.—EEG activity at rest and during photic stimulation were obtained on 5 rhesus monkeys raised from the 5th day on a diet containing phenylalanine and from 4 monkeys on a standard laboratory diet. Resting record of PKU animals showed a predominance of slow waves. No PKU monkey records showed 3/sec. spikes and waves though clinical seizures were present. The normal animals displayed a predominance of high frequency activity. In comparison to normal monkeys, some PKU animals had a reduced following response to photic stimulation.—*L. C. Johnson.*

4481. Callaway, Enoch, III. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) Factors influencing the relationship between alpha activity and visual reaction time. *EEG clin. Neurophysiol.*, 1962, 14, 674-682.—Several studies by the author concerning the relationship between alpha activity and visual reaction time are reported. Evidence is presented to indicate that for a given individual there is an enduring tendency for particular phases of the alpha cycle to be associated with fastest or slowest reaction times. Evidence is also presented to indicate that the alpha phase at which stimulation evokes slowest reaction time is not significantly or consistently shifted by altering the stimulus intensity. The relationship of alpha phase to cortical excitability is discussed as a possible explanation of some of the results presented.—*L. C. Johnson.*

4482. Gengerelli, J. A., Gustafson, L. A., & Priddy, R. D. (U. California, Los Angeles) Studies in the neurophysiology of learning: VI. Electrophysiological recording from the rat's brain during operant learning. *Psychol. Rep.*, 1962, 11 (1), 279-290.—Brain waves were recorded, and also the output of an integrator unit which yielded a quantitative index of wave amplitude, from subcortical centers in 3 rats learning to bar press for food. "Average wave amplitude diminished during the initial stages of habit formation, but as the pattern of response became mechanized, average amplitude increased. During extinction this increased amplitude was maintained or increased further. At the time the animals secured the food pellet from the cup there was a definite desynchronization of brain rhythm whose average duration was of the order of one second. This phenomenon continued in the extinction period, although it was not so marked and its duration was significantly shorter."—*B. J. House.*

4483. Hein, P. L., Green, R. L., Jr., & Wilson, W. P. (Duke U.) Latency and duration of photically elicited arousal responses in the electroencephalograms of patients with chronic regressive schizophrenia. *J. nerv. ment. Dis.*, 1962, 135(4), 361-364.—"The latency and duration of the EEG arousal response to photic stimulation were studied and compared in a group of 18 patients with chronic regressive schizophrenia and 18 normal controls. While the results obtained showed no significant difference between the two groups, intragroup variability was much greater in the schizo-

phrenic patients. The possible significance of this finding is discussed."—*N. H. Pronko.*

4484. Ivanova, M. P. (Central Research Inst. Physical Culture) O sootnoshenii dlitel' nosti depressii osnovnykh elektricheskikh ritmov mozga i latentnogo perioda dvigatel'noi reaktsii. [Relationship between the depression of EEG and the motor RT.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 437-442.—Motor reaction time (RT), EEG, and EMG were recorded when Ss (not described) were reacting to visual stimuli presented at different distances from the center of the field of vision. It was found that in cases of shorter RT, the depression of EEG was also shortened, and vice versa.—*A. Cuk.*

4485. Livanov, M. N. (Inst. Higher Nervous Activity, USSR Acad. Sciences) Prostranstvennyi analiz bioelektricheskoi aktivnosti golovnogo mozga. [Spatial analysis of the bioelectrical activity of the brain.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 399-409.—By means of a 50- and 100-channel electrotoposcope the bioelectrical mosaic of the cerebral cortex both in animals and man was studied under various functional conditions. Particular attention is given to the analysis of the spatial synchronism of biopotentials. Relationships, distribution curves, and topographic zones are studied.—*A. Cuk.*

4486. Lorens, Stanley A., Jr., & Darrow, Chester W. (Inst. Juvenile Research, Chicago, Ill.) Eye movements, EEG, GSR and EKG during mental multiplication. *EEG clin. Neurophysiol.*, 1962, 14, 739-746.—Data from 10 Ss before and during mental multiplication were obtained to investigate eye movement and its relationship to EEG, EKG, and GSR during cognitive activity. Each S showed a significant increase in eye movement rate during the task. Eye movement rate, however, was not related to changes in the other variables studied. Alpha blocking was noted during the task in 6 Ss, but no unique EEG wave forms (kappa, high voltage frontal delta, or theta) were found.—*L. C. Johnson.*

4487. McAdam, D. W., Knott, J. R., & Ingram, W. R. (State U. Iowa) Changes in EEG responses evoked by the conditioned stimulus during classical aversive conditioning in the cat. *EEG clin. Neurophysiol.*, 1962, 14, 731-738.—Changes in the evoked responses to a conditioned stimulus (flashing light) during the development of a classically conditioned leg flexion were studied in a total of 9 cats. Electrograms were taken from the anterodorsal hippocampus, nucleus medialis dorsalis of the thalamus, the midbrain reticular formation, and the anterior lateral, posterior lateral, and posterior sigmoid gyri of the cortex. Systematic alterations in responsivity were demonstrable in certain brain areas (hippocampus), and not in others (reticular formation) during the early phases of conditioning. These changes paralleled the development of an orienting response. These changes appear to be reversible and not to parallel the development of the conditioned response per se. The variability of response from area to area and at various stages of the conditioning process indicate that the neurophysiological description of learning must be in terms of multiple, time-sequence correlates, and not a single neural correlate.—*L. C. Johnson.*

4488. Morrell, Lenore, & Morrell, Frank. (Stanford U. School Medicine, Palo Alto) **Non-random oscillation in the response-duration curve of electrographic activation.** *EEG clin. Neurophysiol.*, 1962, 14, 724-730.—The response-duration curve for the alpha-blocking response to a bright double flash of light was studied in 25 normal Ss; 5 were under various drugs and one under a placebo. Data for placebo and for methamphetamine are presented. The data indicate there is a nonrandom oscillatory process affecting alpha-blockade response duration which is superimposed upon the habituation curve. For 60 trials (placebo) there was an exponential decrement in mean duration of alpha-blockade between Trials 1 and 29; a steady increase from Trial 30 to 37 followed by a 2nd decrease and then a 2nd increase in the last 5 trials. Amphetamine produced a striking increase in mean response duration, but an oscillatory process appeared to be still present.—L. C. Johnson.

4489. Naumova, T. S. (Brain Inst., USSR Acad. Medical Sciences) **Dinamika élektricheskikh protsessov v strukturakh prodolgovotogo mozga i v kore pri osushchestvlenii reflektornykh reaktsii u sobak na razdrazheniia raznoi intensivnosti.** [Dynamics of electrical processes in medullar and cortical structures of dogs during formation of reflex reactions to stimulation of different intensity.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 118-128.—EEGs were recorded from the acoustic analyzer (cochlear nuclei of the medulla and the middle ectosylvian gyrus), from the motor analyzer (gracilis and cuneatus and the sigmoid gyrus) as well as from the reticular formation during unconditioned and conditioned defense responses in dogs to acoustical stimuli. It was found that reflexes to weak acoustic stimuli are accompanied by a generalized drop in electrical activity. The general conclusion was that changes in the brain stem depend, other conditions being equal, upon the intensity of the stimulus.—A. Cuk.

4490. Naumova, T. S. (Brain Inst., USSR Acad. Medical Sciences) **Ob élektrograficheskom vyrazhenii vnutrennego tormozheniia v prodolgovatom, srednem mozge i kore u sobak na zvukovye razdrazheniia raznoi intensivnosti.** [Electrographic manifestation of the internal inhibition in the medulla, midbrain and cortex of dogs in response to auditory stimuli of various intensity.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 489-499.—Purpose was to study the effect of the intensity of the inhibitory stimulus on the nature of the EEG activity. It appears that the mechanism of the internal inhibition cannot be considered independently of the physical characteristics of the inhibitory stimulus. When the stimuli are weak or moderate, there is no change in the EEG. Strong stimuli are accompanied by a generalized decrease in the EEG activity particularly in the brain stem and in the motor areas.—A. Cuk.

4491. Nebylitsyn, V. D. (Inst. Psychology, RSFSR Acad. Pedagogical Sciences) **Al'fa-indeks i balans osnovnykh nervnykh protsessov.** [Alpha index and the equilibrium of the basic nervous processes.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 85-88.—Ss were 20 males and 2 females aged 18-30. Their EEG was recorded and the data correlated with 7 different indices of nervous system equilibrium. All the correlations were negative, ranging from $-.24$ to $-.64$, and significant at the .05

level with the exception of 1. It was concluded that the alpha index does reflect the relationship between the excitatory and inhibitory process, and can be used as an index of the balance of the nervous processes.—A. Cuk.

4492. Rao, V. H. Gundu, & Krishnaswamy, N. **A new electroencephalograph.** *Pratibha*, 1959, 2 (2), 45-50.—Details of the newly designed electroencephalograph (its preamplifier, noise, push-pull amplifications, and discrimination) are discussed. The instrument has successfully undergone preliminary testing.—U. Pareek.

4493. Rodin, E. A., Luby, E. D., & Gottlieb, J. S. (Lafayette Clinic, Detroit) **The electroencephalogram during prolonged experimental sleep deprivation.** *EEG clin. Neurophysiol.*, 1962, 14, 544-551.—To determine the effect of sleep deprivation on EEG, 16 healthy, volunteer, male Ss between ages of 18 and 34 were examined after 24, 48, 72, 96, and 120 hours of sleep loss. EEGs showed marked evidence of drowsiness from the 24 and 48 hour period on. If S was kept alert the EEGs showed a desynchronized pattern. During first 48 hours of sleeplessness, 5 Ss showed high voltage paroxysmal activity similar to that seen in some convulsive patients. These 5 Ss also had low thresholds for intravenous megitimide.—L. C. Johnson.

4494. Rossi, G. F., Favale, E., Hara, T., Giusani, A., & Sacco, G. (U. Genova, Italy) **Researches on the nervous mechanisms underlying deep sleep in the cat.** *Arch. Ital. Biol.*, 1961, 99(3), 270-289.—"The EEG, EMG and behavioral criteria followed for the valuation of the depth of sleep are described. Low rate electrical stimulation of the thalamic and reticular EEG synchronizing systems is ineffective during deep sleep. The intravenous injection of thiopental sodium during deep sleep yields a further increase of the threshold of reticular and sensory arousal, leaves the EMG silence unaffected but induces EEG synchronization. Low rate electrical stimulation of the thalamic recruiting system becomes once more effective following the injection of barbiturate."—C. T. Morgan.

4495. Rusinov, V. S. (Inst. Higher Nervous Activity, USSR Acad. Sciences) **Élektrofiziologicheskie issledovaniia pri obrazovanii vremennoi sviazi.** [Electrophysiological investigations during the formation of temporary connections.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 410-417.—Discussion of experimental data obtained in the last 5-6 years dealing particularly with slow shifts of steady potentials. Contributions by A. Arduini (et al.), T. B. Shvets, P. A. Pavlygina, and others are analyzed.—A. Cuk.

4496. Swisher, J. E. (U. Florida) **Manifestations of "activated" sleep in the rat.** *Science*, 1962, 138(Whole No. 3545), 1110.—A sleep phase similar to feline "activated" sleep was found to occur regularly in normally sleeping rats. However, at these times the electroencephalogram differed from the waking or "activated" pattern in being dominated by 6- to 8-per-second waves. Instead of assuming a very relaxed posture, as cats in "activated" sleep do, the rats tended to undergo shifts in muscle tone, occasionally of considerable magnitude.—Journal abstract.

4497. Tolmasskaia, E. S., & Dykman, L. M. (Psychiatric Inst., RSFSR Ministry Health, Moscow, USSR) **O roli retikuliarnoi formatsii v pro-**

vedenii interotseptivnykh impul'sov. [Role of the reticular formation in transmitting interoceptive impulses.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 161-168.—Electrodes were implanted in the brain of 15 rabbits during interoceptive (stomach distention by means of a rubber balloon) and exteroceptive stimulation (photic, acoustic, and tactile stimuli). During interoceptive stimulation the most constant and pronounced changes were in the RF, hypothalamus, hippocampus, and motor, orbital, and limbic parts of the brain. No changes were observed during interoceptive stimulation after administration of small doses of chlorpromazine.—*A. Cuk.*

4498. Trabka, Jan. (Medical Acad., Krakow, Poland) **High frequency components in brain wave activity.** *EEG clin. Neurophysiol.*, 1962, 14, 453-464.—Experiments were performed on 5 cats with chronically implanted electrodes under normal and drug conditions. Frequency and auto correlation analyses of EEG recordings were done. Experimental and control recordings established the existence of brain potentials in the frequency range 200-500 cps, more especially in the range 200-300 cps. Auto-correlational analysis indicated high frequency waves were not steady, persistent or time-locked.—*L. C. Johnson.*

(Lomonosov U., Moscow, USSR) **Bioelektricheskaya aktivnost' nekotorykh otdelov golovnogo mozga pri vyrobote i ugashenii pishchedobvyatelnogo uslovnogo refleksa.** [Bioelectrical activity of some parts of the brain during the formation and extinction of food procuring conditioned reflexes.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 547-554.—Electrical activity of the following brain areas of 6 rabbits was investigated: optical and motor regions, the lateral geniculate body, and the reticular formation. The background electrical activity oscillates between 6-7 cycles per second. After the formation of the CR, the stimulus produces short volleys of synchronized oscillations of higher frequency (8-9.5 per sec.) and greater amplitude. These oscillations disappear when the response is extinguished.—*A. Cuk.*

EVOKED POTENTIALS

4500. Butkhuizi, S. M. (Inst. Physiology, Tbilisi, USSR) **O vliianii kory bol'shikh polushariĭ na khvostatoe iadro.** [On the influence of the cerebral cortex on the caudal nucleus.] *Soobshch. Akad. Nauk Gruz. SSR*, 1962, 28(3), 363-368.—This study investigates the influence of electrical stimulation, applied slowly (1-2 per sec.) and more rapidly (6-15 per sec.) in the sensorimotor and parietal cortical areas, on the evoked potentials of the caudal nucleus in non-narcotized curarized cats. In the 1st instance the response potentials exhibit small latent periods; in the 2nd, potentials arise of the "recruiting response type." It is also shown that potentials of the caudal nucleus, evoked by peripheral stimulation, undergo considerable change under the influence of preliminary cortical stimulation: electric stimuli applied slowly (6-8 per sec.) magnify these potentials, while those applied rapidly (50-100 per sec.) suppress them.—*I. D. London.*

4501. Desmedt, J. E. (U. Brussels, Belgium) **Auditory-evoked potentials from cochlea to cortex as influenced by activation of the efferent olivo-**

cochlear bundle. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1478-1496.—The crossed olivo-cochlear bundle (OCB) of Rasmussen was stimulated stereotactically in acute experiments on cats immobilized by flaxedil. Maximal inhibition of the N₁ auditory-nerve response to click was equivalent to a 25-db. decrease in stimulus intensity. "The potentials evoked in cochlear nucleus, superior olive, inferior colliculus, medial geniculate, and auditory I area of the cerebral cortex . . . disclosed a decrease proportional to that of N₁." The OCB activation paradoxically potentiates the cochlear microphonic potential (CM), but the change amounted at most to a 4-db. increase. Various parameters of OCB effects were analyzed in detail, e.g., voltage, duration, frequency, and number of shocks delivered to the bundle, and interval between the OCB stimulation and the testing sound. Neurophysiol.*, 1962, 14, 557-560.—A flexible arrangement of instrumentation is described whereby standard components can be formed into a pulse height selector or window, and an average frequency computer for study of nerve impulse discharges. An experiment demonstrating its effectiveness in separating different physiological signals is provided.—*L. C. Johnson.*

4503. Katsuki, Y., Suga, N., & Kanno, Y. (Tokyo Medical & Dental U., Japan) **Neural mechanism of the peripheral and central auditory system in monkeys.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1396-1410.—The properties of the primary auditory neuron—tonotopic organization, response pattern, and response area—were studied. 2 groups of neurons could be separated in terms of threshold in the low- and middle frequency range. The rate of increase of fiber-discharge with the change of sound intensity was examined at the characteristic frequency of a neuron. This rate of increase and the threshold of a neuron were well-correlated. 2 types of response areas, wide as well as narrow, were obtained with single-tone bursts at the cortex. By the simultaneous delivery of 2 sounds, these areas were found to be altered in different ways, even though they were originally similar. Cortical neurons are characterized by phasic on, off, and on-off response patterns.—*A. M. Small, Jr.*

Biol.*, 1962, 100(1), 86-114.—"Using rabbits with intact nervous system, and without anaesthesia or curare, we have studied the effects of natural stimuli, both specific (luminous), and non-specific (acoustic, olfactory and painful) on the discharge of single units of the primary optic cortex. Of the units recorded in this area, 73% did not alter their discharge during intermittent luminous stimulation. 9% gave variable responses, while 18% were definitely influenced.—*C. T. Morgan.*

SENSORY PHYSIOLOGY

4505. Ades, Harlow W., Engström, Hans, & Hawkins, Joseph E., Jr. **Structure of inner ear sensory epithelial cells in relation to their func-**

tions. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-2005, Subtask 4, Rep. No. 1. ii, 26 p.—The structure and relationships of the hairs of the cochlear and vestibular sensory cells have been investigated in fixed and fresh tissue by light, phase-contrast, and electron microscopy. The cochlear hairs closely resemble the stereocilia of the vestibular cells, but there are differences in size, number, and arrangement between those of the inner and outer hair cells. In the cuticle-free region of the cell-surface a basal body is found, corresponding to the single kinocilium on each vestibular cell. The stiff cochlear stereocilia are regarded simply as levers, transmitting mechanical energy from the overlying tectorial membrane by way of the cuticular plate to the basal body. It seems unlikely that their bending, as such, has the importance generally ascribed to it. In view of the great functional significance of modified kinocilia in other sense organs, the basal body, like the vestibular kinocilium, with its associated mitochondria, membranes, and granules, appears to be the essential excitable structure of the hair cells. (25 ref.)—*USN SAM*.

4508. Fernández, C., Butler, R., Konishi, T., & Honrubia, V. (U. Chicago) **Cochlear potentials in the rhesus and squirrel monkey.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1411-1417.—Contrary to previous reports, no important differences were noted between the results obtained in rhesus and squirrel monkeys and those reported for the cat and guinea pig. Round-window recording of responses to sound stimuli exhibited cochlear microphonics (CM) of nearly 2 mv. at maximum. The input-output curves showed that CM of these primates behaved similarly

to those reported for the cat and guinea pig. When a micropipette was advanced from scala tympani into the organ of Corti, an increase in magnitude of CM was recorded, as well as a negative DC potential of about 75 mv. Perforation of the reticular lamina was associated with a change in polarity of CM and the appearance of an endocochlear potential (about +75 mv). Oxygen deprivation depressed CM and changed the polarity of the endocochlear potential from +75 to -20 mv. (27 ref.)—*A. M. Small, Jr.*

4509. Flanagan, James L. (Bell Telephone Lab., Murray Hill, N. J.) **Computational model for basilar membrane displacement.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1370-1376.—"A computational model is described for estimating basilar-membrane displacement in the human ear when the sound pressure at the eardrum is known. The model embodies rational-function approximations of middle-ear transmission and of stapes-to-membrane transmission. The physiological data upon which it is based stem primarily from the researches of Békésy. Besides computational convenience, the rational-function format has the additional advantage that the model can, if desired, be realized in terms of lumped-constant electrical circuits. The model has been found to be a useful analytical tool for relating subjective auditory behavior and the acoustomechanical operation of the ear."—*A. M. Small, Jr.*

4510. Flock, Åke; Kimura, Robert; Lundquist, Per-Gotthard, & Wensäll, Jan. (Karolinska Inst., Stockholm, Sweden) **Morphological basis of directional sensitivity of the outer hair cells in the organ of Corti.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1351-1355.—"Electron-microscope studies of cross sections of hair bundles on the outer hair cells in the organ of Corti show a consistent orientation of the sensory hairs. In the cuticle, a basal body is regularly found on the side of the cell toward the Hensen's cells. The sensory hairs are organized in the shape of a 'W' pointing towards the basal body. The morphological polarization of the hair cells in the organ of Corti is discussed in the light of similar polarization of the hair cells in the vestibular sensory epithelia and the lateral-line canal organs. A close relation is to be found between the morphological and electrophysical polarization of the mechanoreceptors in the sense organs of hearing and equilibrium."—*A. M. Small, Jr.*

4511. Greenwood, D. D. (U. Wisconsin) **Approximate calculation of the dimensions of traveling-wave envelopes in four species.** *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. II), 1364-1369.—Calculations were based on Békésy's measurements of the tuning curves of single points on the basilar membrane of each species, and on 4 empirical functions, 1 per species, relating frequency to position of maximum amplitude on the basilar membrane. It was found that the distances over which a traveling wave damps from maximum amplitude to some fraction of maximum amplitude appear to be approximately constant, independent of the position of maximum amplitude on the membrane. In comparing the traveling-wave envelopes of elephant, man, guinea pig, and chicken, it was found that (a) the shape of a traveling-wave envelope is quite similar among the 4 species; (b) the distance over which a traveling wave damps from maximum to "zero" amplitude is the

greater the longer the basilar membrane; (c) this distance, in the species compared, seems to be an approximately constant fraction of the length of the basilar membrane, independent of the length of the membrane.—*A. M. Small, Jr.*

4512. **Henkin, R. I., & Powell, G. F.** (National Inst. Mental Health, Bethesda, Md.) **Increased sensitivity of taste and smell in cystic fibrosis.** *Science*, 1962, 138 (Whole No. 3545), 1107-1108.—Cystic fibrosis is consistently accompanied by the ability to taste and smell salt, sweet, sour, and bitter substances in solution at concentrations much more dilute than those at which the substances are detectable by normal persons. These abnormal thresholds are not affected by the administration of carbohydrate-active steroids.—*Journal abstract.*

4513. **Iurato, Salvatore.** (U. Milan, Italy) **Functional implications of the nature and submicroscopic structure of the tectorial and basilar membranes.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1386-1395.—The nature and the submicroscopic structure of the tectorial and basilar membranes have been studied with phase-contrast, polarized-light, and electron microscopy, X-ray diffraction, and analytical chemistry. The tectorial membrane consists of submicroscopic filaments arranged fairly compactly, to form numerous transverse and a few longitudinal fibrous bundles. The basilar membrane consists of a supporting layer which is covered on the tympanic face by the basilar-membrane cells. The supporting layer is made of filaments arranged in a transverse direction. In order to find a relationship between structure and mechanical properties, these results are compared with those of Békésy's experiments.—*A. M. Small, Jr.*

4514. **Lawrence, Merle.** (U. Michigan) **Middle ear mechanics and surgery for deafness.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1509-1513.—Békésy's contributions to our understanding of the mechanics of the middle ear are reviewed as they apply to present-day middle-ear surgery. In addition to discussing the transformer action of the middle ear, the paper describes several characteristics of stapes action and of the tympanic membrane with its associated ossicles. It is shown that the plungerlike action of the stapes and the mass of the head of the malleus and incus are important in the proper operation of the normal ear.—*A. M. Small, Jr.*

4515. **Legoux, J.-P.** (Collège de France, Paris, France) **Changes in the cochlear microphonic of the guinea pig produced by mechanical factors in the inner ear.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1504-1508.—The cochlear microphonics (CM) of the guinea pig have been recorded by differential electrodes located in various turns of the cochlea. Increased intracochlear pressure produces a selective decrease in the CM recorded from the apical part of the cochlea. Touching the basilar membrane with a hair in the basal turn modifies the CM recorded in that region, but leaves unchanged the CM recorded in the upper parts. Pressing on the basilar membrane in the second turn modifies the CM recorded in the apical part, but not those of the basal turn. (20 ref.)—*A. M. Small, Jr.*

4516. **Møller, Aage R.** (Royal Inst. Technology, Stockholm, Sweden) **Acoustic reflex in man.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1524-1534.—

The intra-aural muscle reflex in man as elicited by sound stimulation is examined through the change in the acoustic impedance as measured in the auricular canal. When only one ear is stimulated, the sensitivity of the muscle reflex is found to be greater for ipsilateral than for contralateral stimulation. When both ears are stimulated, the sensitivity of the reflex is greater than for ipsilateral stimulation. Complex sounds with low-peak factor, such as band-pass-filtered noise, are more efficient than sinusoids in eliciting the muscle reflex. The muscle reflex is approximated to a mechanism consisting of a linear envelope detector followed by an integrator.—*A. M. Small, Jr.*

4517. **Pfalg, Reinhard K. J.** (U. Hamburg, Germany) **Centrifugal inhibition of afferent secondary neurons in the cochlear nucleus by sound.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1472-1477.—In 40 anesthetized guinea pigs and 1 cat, the left middle-ear and cochlea were destroyed. Via the left internal meatus, glass electrodes were placed inside the cochlear nucleus. The de-afferented secondary neurons in the cochlear nucleus were never found to be excited by sound, but their excitability could be checked by recording their spontaneous activity. In 34 out of 260 spontaneously discharging secondary neurons, the repetition rate was clearly depressed by sound given exclusively to the opposite intact ear. This sound-produced inhibition must have been transmitted by centrifugal fibers. The degree of inhibition depended on the intensity and frequency of the sound. (19 ref.)—*A. M. Small, Jr.*

4518. **Teas, Donald C., Eldridge, Donald H., & Davis, Hallowell.** (Central Inst. Deaf, St. Louis) **Cochlear responses to acoustic transients: An interpretation of whole-nerve action potentials.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1438-1459.—Intracochlear electrodes in the guinea pig are used to measure the relations among cochlear potentials in response to slow acoustic transients. The traveling wave of Békésy is described in terms of cochlear microphonic (CM) voltage as functions of time and place along the cochlear partition. From the results, it is clear that the duration of the stimulating phase of CM along the cochlear partition significantly exceeds the apparent duration of the whole-nerve-action-potential (AP) response to these transients. Selective changes in the waveforms of the AP responses, as opposed to simple reductions in amplitude, are observed when the transients are accompanied by bands of noise and after local chemical or mechanical injury to the organ of Corti. The whole-nerve AP wave-form is considered as the complex product of 2 functions in time, the diphasic unit of response and the numerical sequence of newly active neurons. (23 ref.)—*A. M. Small, Jr.*

4519. **Zwislocki, J.** (Syracuse U.) **Analysis of the middle-ear function: I. Input impedance.** *J. Acoust. Soc. Amer.*, 1962, 34 (9, Pt. II), 1514-1523.—"A quantitative theory of the middle-ear acoustics is developed and expressed in terms of an electric analog. The analog network is based on the functional anatomy of the middle ear. The numerical values of its elements are derived from impedance measurements on normal and pathological ears and from anatomical data. It is shown that the input impedance of the analog agrees within the experi-

mental error with the acoustic impedance at the eardrum, and that changes in analog parameters corresponding to known anatomical changes produce the same effect on its impedance characteristics as measured at the eardrum." (17 ref.)—*A. M. Small, Jr.*

4524. **Denisova, A. S.** (Inst. Physiology, Acad. Science, USSR) **Dinamika izmeneniya uslovnnykh refleksov sobak posle vvdeniya mal'kikh doz adrenalina.** [Dynamics of the changes of conditioned reflexes of dogs after the introduction of small doses of adrenalin.] *Dokl. Akad. Nauk SSSR*, 1962, 142(3), 725-727.—After 4 dogs had been conditioned to give salivatory responses adrenalin was injected subcutaneously. Successive doses of .1 and .3 ml. of 1:1000 solutions of adrenalin were given 15-30 days apart. Reactions of the dogs had 2 phases. The 1st phase, 5-9 min. after injection, showed an increase in CR magnitude and motor arousal of the animals. The 2nd phase, 1 hr. to 1½ hr. after injection, showed CR amplitude lower than normal and the dog's behavior was sluggish and sleepy. In dogs classified as having excitable nervous systems, the sleepy state was alternated with motor arousal accompanied by panting. The differences in magnitude of the doses appeared to make little difference in reaction.—*H. Pick.*

4525. **Duryinyan, R. A.** (Inst. Normal & Pathological Physiology, Acad. Medical Sciences, USSR) **Vliyaniye aminazina na vyzvannyi potentsial kor'y.** [Influence of aminase on evoked potentials of the cortex.] *Dokl. Akad. Nauk SSSR*, 1961, 141(5), 1253-1256.—Recordings of potentials in the cortical sensory projection area for the forelimbs were made with cats while the central end of a dissected nerve in the contralateral limb was stimulated with single rectangular wave pulses. Aminase injected intravenously produced the following changes in evoked potentials after 2 or 3 minutes: the latent period of the primary response increased by about .7-1.0 msec., the length of the positive phase increased 1 to 1.5 msec., the amplitude of the positive phase decreased by more than 100 uv. The duration of the negative phase increased 5 fold, and its amplitude was lowered on the average 250 uv. There was practically complete blocking of the Forbes and Morrison secondary potential. The fact that the negative and secondary phases of the wave are the ones primarily affected is interpreted as indicating communication between the neural elements of first cortical layers with fibers from the diffuse thalamic-cortical system.—*H. Pick.*

4526. **Gibson, John.** (Queen's U., Belfast, North Ireland) **Emotions and the thyroid gland: A critical appraisal.** *J. psychosom. Res.*, 1962, 6(2), 93-116.—Some of the conclusions of this extensive survey of the literature are: There is no evidence that emotional stress can produce changes in thyroid activity or create hypothyroidism in man, although stress will inhibit temporarily thyroid activity in animals. Adrenaline does not seem to activate the pituitary with respect to thyroid stimulating hormone. A single episode of severe stress does not seem able to cause thyrotoxicosis, although long continued or often repeated emotional stress may precipitate it in a predisposed S. (175 ref.)—*W. G. has remained unchanged. Added are sections on the relationship of physique with autonomic nervous functions, gynecological disturbances, puberal dystrophy, and "stress" (prisoner-of-war problems). A chapter on the "theory of somato-psychical functional systems" has also been prepared.—*J. C. Brengelmann.*

4530. Latané, Bibb, & Schachter, Stanley. (Columbia U.) Adrenalin and avoidance learning. *J. comp. physiol. Psychol.*, 1962, 55(3), 369-372.—Rats were injected with 1 of 3 solutions, and then given 200 shock-avoidance trials in a shuttle box with light as the CS. On several measures of acquisition of the avoidance response, rats receiving .0125 mg. adrenalin per 100 gm. body weight scored significantly higher than rats receiving .25-.50 mg./100 gm. or placebo controls. The apparent nonmonotonic relationship between dosage and learning may result partially from the pathological effect of large doses of adrenalin.—*W. A. Wilson, Jr.*

4531. Levy, Jeanne, & Michel-Ber, Estera. Sur les relations entre le mécanisme d'action de quelques substances psychotropes et le taux cérébral des amines biogènes ou de leurs précurseurs. [The relations between the mechanism of the activity of some psychotropic substances and the cerebral action of biogenic amines or their precursors.] *Encephale*, 1962, 51(2), 132-148.—Biosynthesis of the biogenic amines, adrenalin and serotonin, and the mechanisms of transformation are reviewed and discussed. Hypotheses concerning the interference of reserpine and monoamine oxydase inhibitors in the action of formation of these amines are discussed. (64 ref.)—*W. W. Meissner.*

4532. Petrovitch, Yu. A., & Podorozhnaya, R. P. (Ukrainian Research Inst. Stomatology, Odessa, USSR) Vydelenie glitsina- C^{14} i metionina- S^{35} slyunnymi zhelezami pri uslovnoi i bezuslovnoi sketretsii. [Excretion of glycine- C^{14} and methionine- S^{35} by salivary glands with conditioned and unconditioned secretion.] *Dokl. Akad. Nauk SSSR*, 1962, 143(2), 487-490.—Glycine- C^{14} or methionine- S^{35} was injected into each of 5 dogs who had previously been conditioned to secrete saliva to a light signal. At various time intervals after injection salivation was evoked in the dogs successively by an unconditioned stimulus and the light signal. The glycine showed up in the saliva in the first minutes after injection. No appreciable amount of methionine was detected till almost an hour after injection. The amount of both the amino acids showing up in the saliva was much less in the case of a conditioned response than in the case of an unconditioned response.—*H. Pick.*

4533. Pincus, G. (Worcester Found. Experimental Biology, Shrewsbury, Mass.) Reproduction. *Annu. Rev. Physiol.*, 1962, 24, 57-84.—This survey was concluded in June 1961, and the material is organized in terms of the following topics: gametogenesis, gamete maturation and release and attendant phenomena, factors affecting the transport and union of gametes, pregnancy, delivery and nurture of young, sex hormones and tumors, effects of sex hormones, metabolism of sex hormones, and the mechanism of sex steroid action. (308 ref.)—*M. J. Wayner, Jr.*

4534. Rosenzweig, Mark R., Krech, David, & Bennett, Edward L. Effects de l'apprentissage sur la chimie et l'anatomie du cerveau. [Effects of training on the chemistry and anatomy of the brain.]

Psychol. Franc., 1962, 7(3), 209-215.—A continuation of an earlier report (see 36: 4DJ81R) on the rate of cholinesterase secretion with different training conditions. The results show an increase in the total weight of the cortex with increase in training. Allowing for this factor, the cholinesterase rates for the cortex and the subcortex are found to be comparable; that is, an increase in rate is associated with the more intensive training procedures.—*C. J. Adkins.*

4535. Sternbach, R. A. (Massachusetts General Hosp., Boston) Assessing differential autonomic patterns in emotions. *J. psychosom. Res.*, 1962, 6(2), 87-91.—In order to discover the autonomic pattern for sadness, 10 children, age 8, were shown the motion picture Bambi while continuous recordings were made of the palmar skin resistance, gastric motility, respiration rate, heart rate, eyeblink rate, and finger pulse volume. At the point they all reported was the saddest, skin resistance and lacrimation increased, suggesting an inhibition of sympathetic nervous system activity. At the happiest point for each of them, there was a significant decrease in gastric peristaltic rate, suggesting a possible decrease in vagal activity.—*W. G. Shipman.*

4536. Thompson, William R., & Goldenberg, Louis. (Wesleyan U.) Some physiological effects of maternal adrenalin injection during pregnancy in rat offspring. *Psychol. Rep.*, 1962, 10, 759-774.—An investigation of "the effect of maternal adrenalin injection during pregnancy on adrenal weights in rats offspring following stress. . . . Data on offspring viability and body weight were also taken. A number of parameters were studied in the design, these being sex of offspring, postnatal rearing, dosage level, and trimester of injection. . . . Injection of adrenalin and saline during pregnancy had no effects on viability, but produced lowered adrenal weights in offspring, this effect being most marked with first trimester treatment. Significant changes in body weight of offspring were also found . . . again more marked in the first trimester groups."—*B. J. House.*

4537. von Hollwich, F., & Tilgner, S. (U. Augenlinik, Germany) Experimentelle Untersuchungen über den photosexuellen Reflex (réflexe opto-sexuel) bei der Ente. [Experimental investigation of the photosexual reflex in the duck.] *Ophthalmologica*, 1961, 142(5), 572-576.—After intermittent irradiation of the eye region in ducks over a total period of 200 hours with approximately monochromatic light of wavelengths 436, 546, 632 and 707 m μ of the same radiation intensity (2.45 W/scm) the size of the testes was recorded. In confirmation of the findings of Benoit it was found that irradiation with long wave light (707 m μ) gave by far the greatest relative weight of testis.—*C. T. Morgan.*

4538. Winokur, G., Stewart, M., Stern, J., & Pfeiffer, E. (Washington U. School Medicine, St. Louis, Mo.) A dynamic equilibrium in GSR habituation: The effect of interstimulus interval. *J. psychosom. Res.*, 1962, 6(2), 117-122.—GSR habituation rate to 5.5 sec. 60 db. tones was studied in 40 medical students. After the first few tone stimuli the degree of habituation is related to the intertrial interval, the shorter the interval, the greater the level of habituation. With shock (0.5 sec. of 0.5 mA intensity) stimulation a similar pattern occurs but takes longer to become apparent.

The asymptote reached in GSR habituation seems dependent on the interstimulus interval.—*W. G. Shipman.*

PSYCHOPHARMACOLOGY

4539. Anichkov, S. V. (Inst. Experimental Medicine, USSR Acad. Medical Sciences) *Farmakologiya uslovnnykh refleksov.* [Pharmacology of CR.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 391-398.—A survey of the field, beginning with the 1st study done in Pavlov's laboratory in 1908 by I. V. Zavadskii. Methods, variables, and results are pointed out.—*A. Cuk.*

4540. Frankenhaeuser, M., & Järpe, G. (U. Stockholm, Sweden) Subjective intoxication induced by nitrous oxide in various concentrations. *Scand. J. Psychol.*, 1962, 3(3), 171-176.—Subjective intoxication at various dose-levels of nitrous oxide was investigated by the method of magnitude estimation. Estimates of intoxication were obtained from the intoxicated Ss themselves and from a group of Os. Both these sets of subjective scale values showed a pronounced and regular increase with increasing dose-levels of the drug. Objective performance changes followed the same general pattern, but were much less pronounced. It was concluded that subjective scaling methods are well suited for measurements of drug-induced changes in subjective variables.—*Journal abstract.*

4541. Gvishiani, G. S. (Inst. Clinical & Experimental Cardiology, Tbilisi, USSR) *Vlianie tifen na uslovnorefleksornuiu deiatel'nost' sobak s gipertoniei.* [The influence of tephene on conditioned-reflex activity in dogs with hypertension.] *Sobshch. Akad. Nauk Grus. SSR*, 1962, 28(6), 753-756.—The effects of tephene on conditioned-reflex activity in 2 dogs were studied. Small doses (10 mg/kg) do not significantly decrease the response to weak conditioned stimuli; larger doses (15-20 mg/kg), simultaneously with decrease of all positive conditioned reflexes, "disinhibit differentiation." Systematic administration of small doses (10 mg/kg) of tephene in dogs with normal blood pressure sharpens differentiation, but in dogs with hypertension there appears some increase in conditioned positive reflexes along with sharpening of differentiation and quickened "extinctive inhibition."—*I. D. London.*

4542. Levin, S. L., & Makhtinger, A. I. (Pediatrics Research Inst., Leningrad, USSR) *Vlianie uslovnorefleksornykh razdrashitelei na avtomaticheskoe (pilokarpinovoe) sliunootdelenie.* [Effect of CS on automatic (pilocarpine) salivation.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 457-464.—The effect of positive and negative Cs on the course of salivation caused by pilocarpine was studied in 3 Ss (age 7-14) by means of the Krasnogorskii motor secretory method. Data show that salivation decreases under positive stimulation and increases, under negative CS. This points to a limitation of humoral automatism under the influence of the excitatory process and to the release of the automatism with the development of cortical inhibition.—*A. Cuk.*

4543. Mendelson, Joseph, & Bindra, Dalbir. (McGill U.) Combination of drive and drug effects. *J. exp. Psychol.*, 1962, 63(5), 505-509.—The effects of chlorpromazine and methylphenidate on a water rewarded lever pressing response were stud-

ied at several levels of thirst. Both drugs decreased response rate despite the fact that one is a depressant and the other a stimulant. There were no significant differences in the decrements in response score produced by either of the drugs at the different drive levels. Methylphenidate produced no marked decrement at the highest drive level as opposed to the decrement seen at the low drive levels. Drive-drug interactions are discussed.—*J. Arbit.*

4544. Mize, Donna, & Isaac, Walter. (Emory U.) Effects of sodium pentobarbital and D-amphetamine on latency of the escape response in the rat. *Psychol. Rep.*, 1962, 10, 643-645.—"The effects of three concentrations of sodium pentobarbital and three concentrations of d-amphetamine on the latency of an escape response were studied in the rat. An analysis of variance indicated a significant difference between the response latencies recorded for the two drugs, but no significant effects related to dosage levels of each drug. The lengthening of the response latency by sodium pentobarbital and the shortening of the response latency by d-amphetamine are discussed as resulting from the action of these drugs on the reticular activating system."—*E. J. House.*

4545. Muecher, H., & Gruenewald, G. (Medizinischen Akademie Duesseldorf, Germany) Pharmacological stimulation of arithmetic performance and graphomotor expansion. *Percept. mot. Skills*, 1962, 15(1), 101-102.—Arithmetic performance and graphomotor expansion proved to be increased by administration of lecithin and vitamin B₁. Data are obtained from a small group of Ss (experimental N=4, control N=4) for a period of 11 weeks. Suggestions are given to interpret the differences between performance behavior and motor effects.—*W. H. Guertin.*

4546. Shchelkunov, E. L. (USSR Acad. Sciences) *Deistvie aminazina, khloratsizina, fenamina i ikh sochetanii na pishchevye i oboronitel'nye uslovnnye refleksy u krysa v labirinte.* [Effect of chlorpromazine, chloracizine, amphetamine, and their combinations on food and defense CR of rats in maze situations.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 173-180.—Chlorpromazine in doses of 1-6 mg produces prolonged disturbances of both CRs. Phenamine in doses of .5-2 mg. can completely or partly remove or prevent these disturbances. Chloracizine exerts no adrenolytic action but produces certain adrenergic effects. It disturbs the CR only when administered in high doses (10-35 mg.).—*A. Cuk.*

4547. Weitzman, Elliot D., & Ross, Gilbert S. (Walter Reed Army Inst. Research, Washington, D. C.) A behavioral method for the study of pain perception in the monkey. *Neurology*, 1962, 12(4), 264-272.—This article describes one of the few available methods in the study of subjectively experienced pain "in which the animal [himself] continuously indicates the level of intensity of nociceptive stimulus he will just tolerate. . . . A behavioral method is described in which increasing intensities of shock are applied to the gasserian ganglion of alert monkeys via implanted electrodes. The animals reduce the intensity of the painful shock by pressing a lever, thereby regulating and maintaining a level of tolerated intensity. This level can be changed by altering the stimulus parameters, prolonging an experimental

session, and administering a variety of drugs. Morphine induces the animal to find and maintain a higher level of tolerated intensity, and chlorpromazine and pentobarbital produce marked fluctuations in intensity tolerated, whereas methamphetamine and procaine produce a significant decrease in variability and a rise of the level. The relation of these findings to the problem of pain is discussed."—R. Gunter.

ENVIRONMENTAL EFFECTS

4548. Farrer, Donald N., & Reynolds, Herbert H. Chimpanzee performance during exposure to 100% oxygen at 14.7 psi. *USAF ARL tech. docum. Rep.*, 1962, No. 62-8. 23 p.—The effects on performance of breathing 100% O₂ at 760 mm. Hg (14.7 psi.) pressure for 15 hours were investigated using 6 chimpanzees in a counter-balanced design. Each S was tested for 15 hours in both a 100% O₂ environment and a 20% O₂ environment. Performance on continuous and discrete avoidance tasks was required on 5 15-minute sessions for each 15-hour test. The results were as follows: 1 S exhibited a decrement on the continuous avoidance task; 2 animals showed an increase in reaction time. It was concluded that exposure to 15 hours of 100% O₂ at 760 mm. Hg (14.7 psi) produced marginal performance decrements in 2 of the 6 chimpanzees.—*USAF ARL*.

4549. Furry, D. E. Mortality in laboratory animals undergoing explosive decompression. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-1002, Subtask 17, Rep. No. 2, ii, 5 p.—During investigations of the effect of explosive decompression in conjunction with other stress conditions, the need arose for information concerning the survival rate of animals being subjected only to the stress of explosive decompression. By a constant time factor of 0.01 sec. animals were explosively decompressed to various terminal altitudes. An LD₅₀ dose for mice undergoing explosive decompression to 30,000 feet was established. The data also indicate a need for further study of guinea pigs undergoing explosive decompression per se in order to establish a lethal and sublethal dose. Mortality of rats undergoing explosive decompression is discussed.—*USN SAM*.

4550. Meier, Gilbert W. (Lab. Perinatal Physiology, San Juan, Puerto Rico) In defense of "Prenatal Anoxia and Irradiation: Maternal-Fetal Relations." *Psychol. Rep.*, 1962, 11(1), 27-31.—A review of some recent literature relevant to comments by Furchtgott and by Levinson (see 37: 674, 675) with respect to a previous study by the writer.—*B. J. House*.

4551. Teichner, Warren H., & Youngling, Edward. (U. Massachusetts) Acclimatization, habituation, motivation, and cold exposure. *J. comp. physiol. Psychol.*, 1962, 55(3), 322-326.—A group of rats were acclimated to a cold environment and trained on a shock-escape response; 5 other groups, acclimated to a normal temperature, were trained at this temperature for varying numbers of days and then trained further in the cold. The cold-acclimated rats showed the greatest response speed and metabolic rate. Response speed after change to the cold environment relative to prechange strength was inversely related to the amount of practice in the original environment. The results are felt to support "a concept of arousal level or generalized drive strength

... [with] metabolic rate as an underlying factor." —*W. A. Wilson, Jr.*

Radiation

4552. Alekseeva, M. S. (Pavlov Inst. Physiology, USSR Acad. Sciences) *Izmeneniia v deiatel'nosti tsentral'noi nervnoi sistemy u potomstva obluchennykh krys*. [Changes in the activity of the central nervous system in the offspring of irradiated rats.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 169-172.—Ss were 3 generations of Wistar rats whose parents were irradiated before mating with radioactive cobalt for 10 days. A control group was used. In the 1st generation no disturbance was recorded. In the 2nd and 3rd generation some of the rats manifested increased motor activity, spontaneous epileptiform seizures, delayed CR, and inertness of nervous processes. The persistence of scratching, licking and washing reflexes and motor stereotypes pointed to a weakening of the cortical cells function.—*A. Cuk*.

4553. Dzhalagonia, SH. L. (Inst. Experimental Pathology & Therapy, USSR Acad. Medical Sciences) *Izmenenie vysshei nervnoi deiatel'nosti obez'ian pri luchevoi bolezni*. [Changes in the higher nervous activity of monkeys during the irradiation disease.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 472-480.—Motor food CRs were elaborated in 6 male baboons who had been previously irradiated with X rays (dose of about 400 r). It was found that during acute irradiation disease the equilibrium of the basic nervous processes is disturbed as a result of general depression of excitability of the central nervous system. In the behavioral reactions (defensive, orienting) inhibitory components predominate. Such disturbances last up to one year and undergo fluctuations.—*A. Cuk*.

4554. Eakin, Suzy, & Thompson, William D. (Baylor U.) Effects of microwave radiation on activity level of rats. *Psychol. Rep.*, 1962, 11(1), 192.—For 20 days activity level was measured immediately after 0-, 30-, or 60-min. exposure to low intensity microwave radiation in 15 rats assigned randomly to the 3 exposure groups. Analysis showed a significant difference between days and an interaction between days and radiation treatment.—*B. J. House*.

4555. Fowler, Harry; Hicks, Samuel P., D'Amato Constance J., & Beach, Frank A. (U. Pittsburgh) Effects of fetal irradiation on behavior in the albino rat. *J. comp. physiol. Psychol.*, 1962, 55(3), 309-314.—Rats exposed to 150 r. of X-radiation on the 14th day of fetal life were compared with controls in adulthood. The experimental rats were (a) inferior on the difficult Hebb-Williams problems, (b) inferior on a visual discrimination, (c) slower to adapt to an open-field situation, and (d) less variable in a 2-choice situation. Histology disclosed a deficient neocortex and corpus callosum, with subcortical ectopia.—*W. A. Wilson, Jr.*

Stress

NUTRITION

4556. Cowley, J. J., & Griesel, R. D. Pre- and post-natal effects of a low protein diet on the behaviour of the white rat. *Psychol. Afr.*, 1962, 9, 216-225.—A modified Hebb-Williams test of "in-

telligence," using escape from water as an incentive, was used to study the effects of a low protein diet. Rats on a low protein diet did more poorly than rats on a regular laboratory diet. Though males reared by low protein mothers showed no ill effects, females were slower in handling stress problems and made more errors. Activity, emotionality, and "intelligence" are discussed in relation to prenatal effects of a low protein diet.—*J. L. Walker.*

GENETICS & BEHAVIOR

B. Lippincott Company. Some of its 30 chapters are: "Defects in Senses and Body Functions," "Mental Diseases," "The Mental Defects," "Intelligence," "Talent and Genius," "Behavior," "Personality and Temperament," "Criminal Behavior," and "Sex and Sexual Behavior."—*E. L. Borrowman.*

LATERAL DOMINANCE

4564. **Crovitz, Herbert F., & Zener, Karl.** (VA Hosp., Durham, N. C.) **A group-test for assessing hand- and eye-dominance.** *Amer. J. Psychol.*, 1962, 75(2), 271-276.—Accurate tests of handedness are required for classification of Ss. There is also need for a quick and efficient method of identifying Ss with extreme lateralities. This report describes simple group methods of screening Ss with respect to hand- and eye-dominance which are useful as a 1st step in selecting Ss for experimentation on problems concerning the relation of laterality to perception. The tests were given to 1569 general psychology students at Duke University over a period of several years.—*R. D. Nance.*

4565. **Fisher, S.** (State U. New York) **Right-left GSR reactivity differences: A methodological note.** *Percept. mot. Skills*, 1962, 15(1), 150.—The purpose of this note is to indicate that it was prematurely assumed in the previous studies that, if one side of the body manifests larger Galvanic Skin Response amplitudes than the other side, it is the more reactive. Since, in these terms, degree of activation is inverse to skin resistance level, it follows from the right-left reactivity data cited that the body side producing the larger GSR is actually the less reactive of the 2.—*W. H. Guertin.*

4566. **Flescher, Irwin.** **Ocular-manual laterality and perceptual rotation of literal symbols.** *Genet. Psychol. Monogr.*, 1962, 66(1), 3-48.—150 4th-grade children from 11 New York City schools were selected on the basis of standardized laterality criteria. 3 sub-samples represented crossed, right, and left dominance patterns respectively. 5 parallel oral reading test forms were serially presented in a circumscribed visual field. The literal symbols of each of the texts were axially rotated to produce 5 distinctively reoriented images. Perceptual responses (rate and accuracy) of each S were individually recorded under the 5 experimental conditions. The essential finding of this study was the absence of any significant effects of differing laterality patterns on the perception of axially rotated reading stimuli. The results also challenged the assumption that retinal inversion is a determinant in reversal tendencies. Additional

findings demonstrated the significance of directional factors in word perception. The importance on controlling for set, sequence, and variability of text difficulty, in perceptual rotation experiments was also established. (44 ref.)—*Author abstract.*

ANIMAL PSYCHOLOGY

4567. Hogan, Jerry A., & Rozin, Paul. (Harvard U.) An improved mechanical fish-lever. *Amer. J. Psychol.*, 1962, 75(2), 307-308.—Recent interest in behavior of submammals has presented the problem of design of a lever for operant conditioning of aquatic forms. The present lever is very sensitive, sturdy, and more reliable than previous mechanical devices. It is easy and inexpensive to build.—*R. D. Nance.*

Amer.*, 1962, 34(8), 1090-1095.—A hydrophone assembly was installed on the east bank of the Straits of Florida in order to study the sounds produced by Marine animals in the natural environment. Sounds from 2 bottom-mounted hydrophones, one in 100 ft. of water and the other in 1200 ft., were recorded on dual track, magnetic tape on a 24-hr. basis. More than 25 categories of sounds were observed during the initial period from Novem- ber 1960 to July 1961. A number of sounds showed repetitive, diurnal patterns and possible seasonal pat- terns. Some tentative identifications have been made.—*A. M. Small, Jr.*

4575. Stokes, Allen W. (Utah State U.) The comparative ethology of great, blue, marsh, and coal tits at a winter feeding station. *Behaviour, Leiden*, 1962, 19(3), 208-218.—"The behaviour of four species of titmice (*Parus* spp.) was observed at a winter feeding station. All four species had the same display but their frequency varied. These dif- ferences were correlated with the relative timidity of the four species. Timidity appeared to depend upon the proximate factors of density and territorial be- haviour of the different species rather than being an innate differences. . . . Each behaviour element was associated with specific probabilities of being followed by attack, escape, or staying. An element that was indicative of a predominant escape tendency in one species indicated the same tendency in all other spe- cies. The same was true for attack and staying ten- dencies. These behaviour elements function as a means of both intra- and interspecific communica- tion."—*A. Barclay.*

EARLY EXPERIENCE (INCLUDING IMPRINTING)

4576. Ader, Robert, & Belfer, Myron L. (U. Rochester) Prenatal maternal anxiety and off- spring emotionality in the rat. *Psychol. Rep.*, 1962, 10, 711-718.—25 Long Evans rats (female) were taught a conditioned avoidance response, then mated. During pregnancy, experimental females received CS presentations in the avoidance apparatus twice daily, while control females were not manipulated. "Cross- fostering occurred between experimental and control litters born within a 48-hr. period. . . . It was found that, irrespective of the Sex and Cross-fostering variables, the offspring of manipulated mothers were significantly more emotional (less active) than con- trol offspring as measured by the open-field test at 30 to 40 days of age." Groups did not differ at 135 days of age. Results are interpreted as supporting the view that prenatal experiences can influence offspring be- havior.—*B. J. House.*

4577. Bell, Robert W., & Adams, David A. (Allegheny Coll.) Emotionality following han- dling within the first five days of life in the rat. *Canad. J. Psychol.*, 1962, 16(3), 234-238.—Rats were handled at 60, 84, or 108 hours after birth. Handling

consisted of placing each pup in a tray of shavings for one 3-min. session. Starting at 86 days of age 10 shocks per day were given for 14 days. At 100 days of age emotionality was tested by one 2-min. trial on the Hall open field test. "For rats handled prior to the 3rd day of age, shock produced increased emotionality. For those immediately after the 3rd day of age, shock decreased emotionality."—R. S. Davidson.

4578 Mason, William A., & Green, Phillip C. (Yerkes Labs.) The effects of social restriction on the behavior of rhesus monkeys: IV. Responses to a novel environment and to an alien species. *J. comp. physiol. Psychol.*, 1962, 55(3), 363-368.—Restricted (laboratory-reared) and feral monkeys were compared on several tests involving an albino rat and on reactions to an unfamiliar room. Although they made fewer contacts with their rats, restricted monkeys were relatively less gentle with their rats in the living cages and chose them less often when they were available as a social incentive. The restricted monkeys crouched, rocked, sucked thumbs, etc., when introduced alone into an unfamiliar room. It is suggested that these "self-directed responses [are] derived from infantile responses ordinarily made with reference to the mother."—W. A. Wilson, Jr.

4579. Melzack, Ronald. (Massachusetts Inst. Technology) Effects of early perceptual restriction on simple visual discrimination. *Science*, 1962, 137(Whole No. 3534), 978-979.—Dogs were raised from infancy to maturity in lighted cages that restricted their visual experience but did not deprive them of all patterned stimulation. After they were released from their cages, they had greater difficulty than normally reared littermates in performing a simple black-white discrimination and in subsequent reversal training.—*Journal abstract.*

4580. Stanley, Walter C., & Elliot, Orville. (Roscoe B. Jackson Memorial Lab.) Differential human handling as reinforcing events and as treatments influencing later social behavior in basenji puppies. *Psychol. Rep.*, 1962, 10, 775-788.—"Beginning at 6½ wk. of age, 20 basenji puppies were trained to run to a person, half receiving handling goal treatment and half, contact with a passive person. Ss were then rated on attraction and fear-avoidance to goal person vs. stranger and in apparatus vs. living pens. Further training was then given with half the Ss receiving changed goal treatment. At this time, 4 additional Ss were run as age controls with the nonhandling goal treatment. Finally, the 10 Ss trained with unchanged goal treatment throughout were tested for reactions to punishment administered by a person." Results showed contact with a passive person the stronger reinforcer, not limited to a critical age. Social responses generalized from training to rating situation. Nonhandled puppies showed stronger emotional reactions to punishment than handled puppies.—B. J. House.

carriage. *Behaviour, Leiden*, 1962, 19(3), 239-259.—A. Barclay.

4582. Fraenkel, Gottfried S., & Gunn, Donald L. The orientation of animals: Kineses, taxes and compass reactions. New York: Dover, 1961. x, 376 p. \$2.00.—This new edition "is an expanded version of the first edition published by Oxford University Press in 1940." An appendix of additional notes and a supplementary bibliography have been added to the original edition.—E. Y. Borrowman.

4583. Hollis, John H. (U. Kansas) Chromatography and behavioral mutations. *Psychol. Rep.*, 1962, 11(1), 182.—A discussion of the importance of research designed to determine whether or not chromatographic patterns are associated with phototactic and geotactic behavioral patterns of *Drosophila*.—B. J. House.

4584. Tinbergen, N., Broekhuysen, G. J., Feekes, F., Houghton, J. C. W., Kruuk, H., & Szulc, E. Egg shell removal by the black-headed gull *Larus ridibundus*: I. A behavior component of camouflage. *Behaviour, Leiden*, 1962, 19(1-2), 75-117.—"The black-headed gull removes the empty eggshell shortly after the chick has hatched. The present paper describes some experiments on the function of this response, and on the stimuli eliciting it. Carrion crows and herring gulls find white eggs more readily than normal gull's eggs; it is concluded that the natural colors of the eggs afford a certain degree of cryptic protection. When normal eggs are given an egg shell at 15 centimeters distance their vulnerability is greatly increased; this 'betrayal effect' decreases rapidly with increased distance between egg and shell. We therefore conclude that egg shell removal helps to protect the brood from predators."—A. Barclay.

4585. Wharton, D. R. A., Black, E. D., Merritt, C. Jr., Wharton, Martha L., Bazinet, M., & Walsh, J. T. (Quartermaster Research & Engineering Cent., Natick, Mass.) Isolation of the sex attractant of the American cockroach. *Science*, 1962, 137(Whole No. 3535), 1062-1063.—The sex attractant of the female American cockroach, "*Periplaneta americana*" (L.), has been collected and isolated by a combination of extraction, distillation, and chromatographic procedures. Progress through these procedures has been followed by bioassay and by ultraviolet spectrophotometry. The attractant has been isolated by gas chromatography, and characterization by mass spectrometry is proceeding.—*Journal abstract.*

MOTIVATION & EMOTION

4586. Bolles, Robert C., & de Lorge, John. (Hollins Coll.) Exploration in a Dashiell maze as a function of prior deprivation, current deprivation, and sex. *Canad. J. Psychol.*, 1962, 16(3), 221-227.—Rats under different conditions of deprivation were observed for 10 minutes in a Dashiell maze. Response measures included quantity and variety of locomotion, speed of entering the maze, and behavior like freezing and grooming which compete with exploration. Prior deprivation, but not current deprivation, significantly increased the amount and variety of locomotion, and decreased competitive behavior. Exploration is a function of environmental stimulus conditions and has only a minor dependence upon the animal's deprivation conditions.—R. S. Davidson.

4587. Furchtgott, Ernest. (U. Tennessee) **Comment on effects of aging on open field behavior.** *Psychol. Rep.*, 1962, 10, 690.—Discussion of a study by Werboff and Havlena (see 37: 4595).—B. J. House.

4588. Griffiths, William J., Jr. (Montana State U.) **Effect of food and water deprivation on shock tolerance of albino rats.** *Psychol. Rep.*, 1962, 11(1), 163-166.—"A total of 250 male inbred Wistar albino rats were tested for tolerance to electric shock in a shock test chamber. Fifty Ss each were tested under no deprivation, 12 hr. water deprivation, 24 hr. water deprivation, 12 hr. food deprivation, and 24 hr. food deprivation. It was found that 12- or 24-hr. food or water deprived Ss tolerated greater shock intensity than non-deprived Ss. It was also found that the longer the deprivation period of water or food, the greater the shock intensity tolerated. The results were discussed in relation to early and recent studies."—B. J. House.

4589. Hildreth, Philip E. (U. California, Berkeley) **Quantitative aspects of mating behavior in *Drosophila*.** *Behaviour, Leiden*, 1962, 19(1-2), 57-72.—When given a choice between red-eyed or white-eyed females, approximately 82% of the male sample copulated first with the white-eyed female. Average length of copulation was longer for 2nd copulations, regardless of type of female.—A. Barclay.

4590. Issac, Walter. (Emory U.) **Evidence for a sensory drive in monkeys.** *Psychol. Rep.*, 1962, 11(1), 175-181.—5 monkeys placed in an experimental chamber had access to a chain which could be pulled to control light or noise stimulation. In 3 experiments, duration of chain-pulling to produce or decrease stimulation was studied under a variety of background and deprivation conditions. "Monkeys did regulate the intensity of stimulation and deprivation conditions affected subsequent behavior. . . . It is believed that a drive for unpatterned sensory input was demonstrated." Results are discussed in relation to central nervous system activity.—B. J. House.

4591. Menzel, E. W., Jr. (Yerkes Lab. Primate Biology) **Individual differences in the responsiveness of young chimpanzees to stimulus size and novelty.** *Percept. mot. Skills*, 1962, 15(1), 127-134.—A single piece of wood, which ranged from 1 square in. to 251 square in. was used. There appeared to be an optimum size of objects for varied manipulatory reactions, smaller objects being handled in cursory fashion, and larger objects being contacted tentatively or not at all. The precise size of the optimum stimulus varied for particular responses, for different Ss, and also in the same S as function of experience with the same or similar objects. Experience tended to increase the size of object required to produce either avoidance or vigorous contact activities; consequently, the behavior of cautious animals came, over a period of weeks, to resemble the initial behavior of bolder animals.—W. H. Guertin.

4592. Miles, Raymond C. (U. Alberta, Canada) **Effect of food deprivation on manipulatory reactions in cat.** *J. comp. physiol. Psychol.*, 1962, 55(3), 358-362.—Objects were suspended by strings from the ceiling, and the number of pulls of these objects was used as a measure of manipulation in cats. Manipulation, and beam-crossing activity in a 2-ft. cage, increased as a function of food deprivation. Ac-

tivity also increased as a function of amount of "activity deprivation," i.e., confinement in a small cage, for periods of 1-9 hr.—W. A. Wilson, Jr.

4593. Novin, Donald, & Miller, Neal E. (Royal Veterinary Coll. Stockholm, Sweden) **Failure to condition thirst induced by feeding dry food to hungry rats.** *J. comp. physiol. Psychol.*, 1962, 55(3), 373-374.—2 groups of hungry rats were made thirsty in a distinctive cage by being fed dry food; rats of one group were then given 3 cc of water there. One control group experienced the cage when satiated for water, and another group were made thirsty elsewhere, and then allowed to drink to satiation in the cage. After 20 days of such training, all groups were tested for amount drunk in the cage after having been satiated elsewhere. No significant differences appeared among the groups.—W. A. Wilson, Jr.

4594. Treichler, F. Robert, & Hall, John F. (Ohio State U.) **The relationship between deprivation weight loss and several measures of activity.** *J. comp. physiol. Psychol.*, 1962, 55(3), 346-349.—The activity of rats in several measuring devices was correlated with weight loss produced by different kinds of deprivation. With increasing weight loss, there was a striking increase in activity wheel scores, but practically no changes in stabilimeter measures and in Dashiell maze activity. Survival measures showed that deprivation involving food withdrawal is more severe than water deprivation, and that deprivation in wheels is more severe than in stabilimeters.—W. A. Wilson, Jr.

4595. Werboff, Jack. (Wayne State U.) **Reply to "Comment on 'Effects of Aging on Open Field Behavior.'"** *Psychol. Rep.*, 1962, 10, 862.—A discussion of comments by Furchtgott (see 37: 4587).—B. J. House.

SENSORY PROCESSES

4596. Christensen, Kent R. (Bell Telephone Labs., Whippany, N. J.) **Isohedonic contours in the sucrose-sodium chloride area of gustatory stimulation.** *J. comp. physiol. Psychol.*, 1962, 55(3), 337-341.—Rats were given preference tests between sucrose standard solutions and comparison solutions containing both sucrose and NaCl, using an "up and down" method to determine the order of presentation of stimuli. Isohedonic curves were formed by determining which compound solutions are equally preferred to the various sucrose standards. "The shape of the contours correlates well with current preference and electrophysiological data."—W. A. Wilson, Jr.

4597. Crampton, George H., & Schwam, Wallace J. (USA Medical Research Lab., Fort Knox, Ky.) **Turtle vestibular response to angular acceleration with comparative data from cat and man.** *J. comp. physiol. Psychol.*, 1962, 55(3), 315-321.—The head-turning response of the box turtle (*Terrapene c. carolina*) to angular acceleration and deceleration was studied in the dark. No saccadic movements were seen, and habituation of the response did not take place. No vestibular nystagmus could be recorded electrically in darkness, nor was postrotatory nystagmus observed. The similarity between turtle head turning and slow phases of cat and human ocular nystagmus suggests that head turning is a simple extended slow-phase deviation not interrupted by fast saccadic movements.—W. A. Wilson, Jr.

4598. Frings, Hubert, & Frings, Mable. (U. Hawaii) **Pest control with sound: I. Possibilities with invertebrates.** *Sound*, 1962, 1(6), 13-22.—The behavior of invertebrates in response to sound is reviewed. The conclusions are almost entirely negative. That is, either the animals do not respond in any predictable fashion or information is lacking regarding their response.—*A. M. Small, Jr.*

4599. Ganz, Leo. (U. Chicago) **Hue generalization and hue discriminability in Macaca mulatta.** *J. exp. Psychol.*, 1962, 64(2), 142-150.—"An experiment evaluated the widely held view that slope of generalization gradient and resolution capacity are inversely related. Four rhesus macaques were trained to emit a simple operant to a monochromatic hue in the 450-630 m μ range. Generalization was then measured under extinction across this range. This gradient was, in all cases, almost horizontal. Operants discriminated with respect to wave length (S^d — S^d about 60 m μ apart) were then developed in these Ss and 2 additional Ss. . . . Each S was trained to discriminate and generalize three successive pairs of stimuli. A number of the gradients revealed differences in slope which were in accordance with the predicted inverse relationship. . . . It was concluded that some infrahuman generalization gradients do reflect the S^d —SG distance in cumulated jnd's. Some factors that may have masked this relationship previously were discussed."—*J. Arbit.*

4600. Pick, Herbert L., Jr., & Kare, Morley R. (U. Wisconsin) **The effect of artificial cues on the measurement of taste preference in the chicken.** *J. comp. physiol. Psychol.*, 1962, 55(3), 342-345.—Chickens could drink freely from a container of water, or from a less preferred solution of NaCl or quinine sulfate. After 18 days, during which a color cue distinguished the 2 fluids, Ss continued to choose the container of the color previously paired with water even when water was presented in both containers. Consumption of a disliked solution was less when the position of the solutions was never changed than when it was changed 5 times a day. However, consumption of the unpleasant solution was somewhat greater when the solutions were switched once a day, presumably due to the reversals required in the learning of position that took place each day.—*W. A. Wilson, Jr.*

4601. Popova, N. S. (USSR Acad. Medical Sciences) **Sravnitel'nye dannye po dvizheniiu i vzaimodeistviu nervnykh protsesov v slukhovom i zritel'nom analizatorakh u sobak i nizshikh obez'ian.** [Comparison of the movement and the interaction of nervous processes in the acoustic and optical analyzer of dogs and monkeys.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 88-94.—Ss were 4 monkeys (3 rhesus and 1 marmoset) and a nonspecified number of dogs. Food CR were established using visual and auditory stimuli. In dogs, strong differences appeared between the auditory and visual processes: the auditory analyzer seemed to function better than the visual. In monkeys these differences were less pronounced.—*A. Cuk.*

4602. Young, Paul Thomas, & Christensen, Kent R. (U. Illinois) **Algebraic summation of hedonic processes.** *J. comp. physiol. Psychol.*, 1962, 55(3), 332-336.—Rats maintained on an unlimited supply of food and water were given a series of tests in the

Young preference tester. Choices were between a sucrose solution and a compound solution of sucrose and NaCl. Several concentrations of both solutions were used. Although many of the tests yielded indiscriminate behavior, there was evidence that the palatability level of a compound solution is an algebraic sum of the hedonic properties of the concentrations of the 2 solutions used.—*W. A. Wilson, Jr.*

4603. Young, Paul Thomas, & Kappauf, William E. (U. Illinois) **Apparatus and procedures for studying taste-preferences in the white rat.** *Amer. J. Psychol.*, 1962, 75(3), 482-484.—The apparatus uses liquid foods or substances in solution. 2 solutions are simultaneously available to the S for 3-4 minutes. Advantages of the present technique include: (a) use of a forced-sampling sequence prior to the preference test, (b) a method of quantifying the S's contact with each solution, and (c) the speed with which preference studies can be conducted. A picture of the apparatus is shown.—*R. D. Nance.*

LEARNING

4604. Grosslight, J. H., Harrison, P. C., Weiser, C. M. (Kent State U.) **Reinforcement control of vocal responses in the mynah bird.** *Psychol. Rec.*, 1962, 12, 193-201.—"In the first study, differential reinforcement of vocal responses produced significantly different frequencies of responding to obtain food. In the second study, the vocal response was brought under specific environmental stimulus control. The relationship of these findings to the position that vocal behavior in sub-human species is difficult, if not impossible, to modify by operant-reinforcement procedures is discussed."—*R. Seidel.*

4605. Pereboom, A. C. (Louisiana State U.) **Continuous recording of spontaneous runway behavior: A normative and methodological study.** *Psychol. Rep.*, 1962, 11(1), 223-237. (Monogr. Suppl. No. 2-V11).—"A continuous, 40-min. tracking record of spontaneous unrewarded locomotion was taken on two successive days from 24 naive adult albino rats. S's running surface was a 12-ft. elevated runway which was placed in a fully illuminated, moderately rich, extra-maze environment." A detailed description of the data is given, including such measures as traversal frequency as a function of time, reciprocal traversal time as a function of traversals, distributions of traversal times, and others. Results are related to theories of learning, fear, and curiosity.—*B. J. House.*

4606. Sedlacek, J. (Charles U., Prague, Czechoslovakia) **Functional characteristics of the centre of the unconditioned reflex in elaboration of a temporary connection in chick embryos.** *Physiol. Bohemoslov.*, 1962, 11(4), 313-318.—"The development of the latent period of the unconditioned swallowing movements was studied in chick embryos from the 17th to the 21st day of incubation. It was found that the latent period gradually shortened, especially in elaboration of a temporary connection, and that the rate of swallowing movements increased."—*C. T. Morgan.*

4607. Sedlacek, J. (Charles U., Prague, Czechoslovakia) **Notes on the characteristics of the temporary connection in chick embryos.** *Physiol. Bohemoslov.*, 1962, 11(4), 307-312.—"The author studied the influence of the length of the interval

between the conditioned stimuli and the effect of strychnine on the effectiveness of the temporary connection between a sound stimulus and an unconditioned defence or swallowing reflex in chick embryos from the 17th to the 21st day of incubation. . . . From these findings it is concluded that the basis of the temporary connection in 17-day chick embryos is evidently the principle of the summation reflex and from the 18th to the 20th day the principle of the dominant. Only on the 21st day does it display characteristics of a genuine conditioned reflex."—C. T. Morgan.

4608. Sedlacek, J. (Charles U., Prague, Czechoslovakia) **Temporary connections in chick embryos.** *Physiol. Bohemoslov.*, 1962, 11(4), 300-306. —"A temporary connection was elaborated by four different methods in chick embryos, from the 17th to the 21st day of incubation. The firmness of the association increases progressively, with significant differences between the 17th and 18th day and the 20th and 21st day."—C. T. Morgan.

Conditioning

4609. Brogden, W. J. (U. Wisconsin) **Contiguous conditioning.** *J. exp. Psychol.*, 1962, 64(2), 172-176. —"Contiguous conditioning is represented by cage-turning CRs of cats to a tone CS. This CR is dependent upon a prior conditioning procedure during which each occurrence of the cage-turning response results in the sounding of the tone. Initial tests of the tone prior to the conditioning training elicited no cage-turning responses. A control group, not given the tone CS, made the same number of responses in the rotator prior to the test for contiguous conditioning that the experimental group made during its training procedure. Tests with the tone CS presented when the S had been quiet for 30 sec. or more were given to all Ss. The frequency of CR of the experimental group was significantly greater than the frequency of response of the control group. The evidence of contiguous conditioning demonstrates that contiguity of stimulus and response is a sufficient condition for learning." The theoretical implications of this finding are discussed.—J. Arbit.

4610. Brogden, W. J. (U. Wisconsin) **The experimenter as a factor in animal conditioning.** *Psychol. Rep.*, 1962, 11(1), 239-242. —"Data are reported on the speed of acquisition of a conditioned shock avoidance response in four groups of rabbits, each of which was trained by a different E. Additional data for two Es involves speed of conditioning of a first and second group of rabbits. Although there was no statistically significant difference between Es for the first set of data, the second set shows both a significant E practice effect and a significant difference between Es."—B. J. House.

4611. Frolov, V. M. (Kirov Military Medical Acad., Leningrad, USSR) **Zavisimost' kislотно-оборонitel'nykh uslovykh i bezuslovykh reflektorov u sobak ot sily bezuslovnogo razdrasheniia.** [Dependence of conditioned and unconditioned acid defensive reflexes upon the strength of the US.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 267-272. —Salivary CRs were elaborated in 7 dogs using sound and light stimuli and different solutions of hydrochloric acid as reinforcement. It was found that the amount of solution of hydrochloric acid can be a reliable measure of the strength of the US. This method of

investigation "makes possible to record objectively the functional changes occurring both in the cortex and in the subcortical areas within a broad range—from the threshold to the ceiling."—A. Cuk.

4612. Gelber, B. (Basic Health Research Inst.) **Acquisition in *Paramecium aurelia* during spaced training.** *Psychol. Rec.*, 1962, 12, 165-177. —"Four groups, each consisting of 12 food deprived cultures of *Paramecium aurelia*, had 3 blocks of 5 training trials with 1 minute between trials within blocks and a half hour between blocks. Cultures differed in nuclear condition, deprivation time and fertilization age. A 5 way analysis of variance showed that nuclear condition, trials within blocks, delays between blocks and age had highly significant effects. Slightly increased time of deprivation significantly affected the vegetative but not the autogamous *paramecia*. Biological implications and techniques for investigating psychological concepts at the cellular level are discussed."—R. Seidel.

4613. Gelber, B. (Basic Health Research Inst.) **Reminiscence and the trend of retention in *Paramecium aurelia*.** *Psychol. Rec.*, 1962, 12, 179-192. —"Two groups of cultures of *Paramecium aurelia*, one vegetative and the other autogamous, were tested for retention at 25 minutes, a 1, 2, 3, 4, 6, 7, 12, and 19 hours after receiving spaced training. Lapse of time since training differentially affected response which rose up to 12 hours, but dropped almost to zero at 19 hours. Trends over time correlated significantly in the 2 groups, but only in the vegetative group did performance on tests correlate with acquisition responses."—R. Seidel.

4614. Gonzales, R. C., Milstein, Sandra, & Bitterman, M. E. (Bryn Mawr Coll.) **Classical conditioning in the fish: Further studies of partial reinforcement.** *Amer. J. Psychol.*, 1962, 75(3), 421-428. —3 experiments using goldfish were performed. Both spaced (24-hour) and massed practice were used. Level of acquisition was lower after partial than after consistent reinforcement. There was no "indication of the paradoxical effect of partial reinforcement on initial resistance to extinction which appears so dependably in work with mammals." There was no change in relative resistance with repeated extinctions.—R. D. Nance.

4615. Gorsheleva, L. S. (Inst. Higher Nervous Activity, USSR Acad. Sciences) **Osobennosti formirovaniia pishchevykh dvigatel'nykh uslovykh reflektorov u belykh krysov v rannem postnatal'nom periode.** [Peculiarities of motor food CR in white rats at an early postnatal period.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 326-331. —CR to several stimuli were established in 27 young rats (aged 20 days). It was found that the excitatory processes in the central nervous system predominate over the active inhibitory processes. The external unconditioned inhibition is very pronounced. With age, the cortical processes become stronger and are characterized by wide generalizations.—A. Cuk.

4616. Green, Phillip C. (U. Wisconsin) **Learning, extinction, and generalization of conditioned responses by young monkeys.** *Psychol. Rep.*, 1962, 10, 731-738. —15 rhesus monkeys were equally divided into 1-day, 30-day, and 300-day groups according to age at beginning of training. On each

training trial, a tone was presented, overlapping during the last of 3 sec. with an electric shock delivered through a floor grid. No differences among the groups were found during 10 days acquisition for a combined measure of conditioning activity and conditioned crouching. The 1-day group had inferior retention of the CR but the groups did not differ in generalization tests. "Further evidence of age-related differences was found in the distribution of the responses, the neonatal animals showing much CC [conditioned crouching] behavior, the 300-days Ss a preponderance of CA [conditioned activity] behavior, while the 30-day Ss showed a mixture of both types of responses."—B. J. House.

4617. Kozlova, L. N. (Pavlov Inst. Physiology, USSR Acad. Sciences) *O korreliatsii mezhdu intensivnost'iu vneshnego tormozheniia v ontogeneze sobak i vozrastnoi dinamiko skorosti zamykaniia uslovnykh svyazei.* [Correlation between the intensity of external inhibition in young dogs and the age dynamics showing in the speed of formation of conditioned connections.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 273-278.—Motor alimentary CR were elaborated in 23 puppies (age 1 to 6 months) using sound as CS. Stimuli which produced external inhibitions were sounds of a metronome, of a bell, and of a rattle. CR forms faster at the age of 2-3 months when there is hardly any external inhibition. The correlation between the intensity of the external inhibition and the appearance of the first CR amounts to .995.—A. Cuk.

4618. McAllister, Wallace R., & McAllister, Dorothy E. (Syracuse U.) *Postconditioning delay and intensity of shock as factors in the measurement of acquired fear.* *J. exp. Psychol.*, 1962, 64(2), 110-116.—"Two experiments concerned with the classical conditioning of fear in rats and the measurement of its effect through the learning of another response (hurdle jumping) were conducted. In Exp. I the effect of intensity of shock . . . used during conditioning was investigated. At each shock level one group was given forward conditioning (light-shock) and one, backward conditioning (shock-light). For all groups hurdle-jumping trials in which S could escape the light by jumping a hurdle were administered immediately following conditioning and were continued on the next day. Evidence of learning was obtained following both forward and backward conditioning but only on the second hurdle-jumping day. Performance, in general, was better following conditioning with the higher shock levels. The results of Exp. II indicated that learning does occur on the first day of hurdle jumping when a postconditioning delay of 1 day is used."—J. Arbit.

4619. Makhalovskaia, D. B. (Sechenov Inst. Evolutionary Physiology, USSR Acad. Sciences) *Issledovanie uslovnykh refleksov, vyrobotannykh na baze evoliutsioniruiushchikh spetsializirovannykh vrozhdennykh refleksov u krolikov.* [CR elaborated on the basis of developing specialized congenital reflexes in rabbits.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 312-317.—Ss were 32 rabbits of the age from 5 to 75 days. CS was a sound of 600 cycles, the US, electrical stimulation of the postero-lateral surface of the neck. The stimulation produced in the 1st 2 to 3 weeks apparent scratching (CR) and shaking movements (UR). An assumption is made

that subordinate relations exist between the shaking and scratching center.—A. Cuk.

4620. Mikhneva, N. E. (Inst. Experimental Medicine, USSR Acad. Sciences) *Dvigatel'nye uslovnye reaktsii sobaki na svetu i v temnote pri trudnykh nervnykh zadachakh.* [Motor CR of dogs performing difficult nervous tasks under conditions of light and darkness.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 302-305.—Conditioned activity of a dog can be easily disturbed by an extra strong stimulus under condition of darkness but not of light. A very strong sound of a rattle produces neurotic symptoms which disappear when light is switched on. This is ascribed to a drop in the general tone and working capacity of the cerebral cortex in darkness.—A. Cuk.

4621. Movchan, N. P. (Inst. Physiology, Acad. Sciences, USSR) *O nalichii stadii dvigatel'noi ritmicheskoi aktivnosti v razvitiu zapredelnogo tormozheniya.* [On the stage of rhythmic motor activity in the development of supraliminal inhibition.] *Dokl. Akad. Nauk SSSR*, 1962, 144(3), 678-681.—In conditioning experiments with dogs in which the intensity of the auditory CS was raised to extremely high values, the dogs first displayed a rhythmic motor activity and then full inhibition of the conditioned response. The situation involved first getting a stable conditioned response of leg flexion to an auditory stimulus of 55 db. intensity. Then the intensity was slowly increased to 125 db. Repeated application of this very intense stimulus resulted first in rhythmic flexions of the leg and finally in complete inhibition of the CR.—H. Pick.

4622. Murav'eva, N. P. (Inst. Experimental Medicine, USSR Acad. Medical Sciences) *Obrazovanie pishchevykh uslovnykh refleksov na dvizhishchiesia predmety u sobak.* [Food conditioning to moving objects in dogs.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 500-507.—Conditioned salivary reflexes were elaborated in 5 dogs in response to various auditory stimuli and to moving objects (a rubber frog and a pendulum were used). CR to moving objects was very fast in some cases, in others it was slow and delayed the unconditioned motor food reaction. This is explained by the nature of the objects which are complex optical stimuli. When used as CS they cause a motor reaction inherent in them (fixing the object with the eyes) and a reaction peculiar to the UR with which they are paired.—A. Cuk.

4623. Travina, A. A. (Inst. Experimental Medicine, USSR Acad. Medical Sciences) *K voprosu o podvizhnosti nervnykh protsessov.* [Mobility of nervous processes.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 260-266.—CRs were established in 2 dogs to a sequence of acoustic and cutaneous stimuli. Food and hydrochloric acid were used as reinforcements. The general conclusion drawn from the analysis of the data was that the nervous processes originating in the cortical areas of the analyzers are more mobile than the processes originating in the structures responsible for the unconditioned responses.—A. Cuk.

4624. Varga, M. E., & Pressman, I. A. M. (Physiological Lab., USSR Acad. Sciences) *O roli poriadka primeneniia i sily sochetamykh razdrazhitelei v zamykanii uslovnoi svyazi.* [The

role of the sequence and the strength of paired stimuli in closing conditioned connections.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 110-117.—Passive lifting of the paw was used as the CS in the formation of CR in 9 dogs. The CS was presented in different combinations, either preceding or following the US. It was established as a general rule that "CR is formed on the basis of the spreading of excitation from the focus of the first to the focus of the second stimulus." The stability of the CR depended to a great extent upon the strength of the US. Backwards conditioning appeared very unstable.—*A. Cuk.*

Discrimination

4625. Besch, Norma F., Anderson, Joyce E., & Horel, James A. (Columbus Psychiatric Inst. Hosp.) **Non-correction method in drive discrimination.** *Psychol. Rep.*, 1962, 11(1), 246.—An experiment with 25 rats in which similarity of correct and incorrect goal arms of a T-maze was varied led to the conclusion that "stimulus characteristics of the detention environment used in the non-correction method are not critical variables in learning a drive discrimination."—*B. J. House.*

4626. D'Amato, M. R., & Jagoda, H. (New York U.) **Overlearning and position reversal.** *J. exp. Psychol.*, 1962, 64(2), 117-122.—"Four experiments were conducted involving extensive overtraining of a position discrimination habit in rats. In Exp. I, II, and III, reversal learning of the position response was consistently and markedly retarded in those Ss that had a moderate proportion of their postcriterion trials forced to the incorrect side. In all three experiments, however, Ss that had the same proportion of postcriterion trials forced to the correct side did not show the overlearning effect, i.e., they did not reverse faster than control Ss that received no overlearning experience. In Exp. IV, run with all free trials, the overlearning effect again failed to appear, although the number of postcriterion trials was increased to a maximum of 800."—*J. Arbit.*

4627. Fox, Robert, & Cormack, Robert H. (Longview State Hosp., Cincinnati, O.) **Response to change of pattern and of depth in the rat.** *Psychol. Rep.*, 1962, 11(1), 299-302.—Response to change was investigated in 5 experiments with 16 rats each. The 1st experiment confirmed previous findings. Rats were exposed to a T-maze with 1 black and 1 white goal arm but prevented from entering the goal arms by Plexiglas doors. On test trials, 1 min. later, given a choice between 2 identical arms, either black or white, rats showed a significant preference for the arm which had changed in brightness. The same design with pattern and alley length changes produced no significant preferences for the changed arm.—*B. J. House.*

4628. Honig, Werner K. (Denison U.) **Prediction of preference, transposition, and transposition-reversal from the generalization gradient.** *J. exp. Psychol.*, 1962, 64(3), 239-248.—"The relationship between stimulus preference and the response strength of singly presented stimuli was investigated with the use of the generalization gradient to provide stimuli of different strengths. After being trained to peck at a 550-m μ stimulus on a VI schedule, pigeons were given two concurrent generalization tests: one consisting of a single stimulus values rang-

ing from 490 to 610 m μ , and one consisting of pairs of such values. . . . Two groups of birds then received discrimination training between 550 m μ as S+ and 560 m μ as S-, one with successive stimulus presentations and one with simultaneous. After this, the generalization and preference tests were administered a second time. . . . An arithmetic model is proposed for the prediction of responses to members of stimulus pairs from single-stimulus values. The determinations of stimulus preference by the generalization gradient follows directly, and transposition is seen to be no more than a special case. The differential results obtained from successive and simultaneous discriminations are discussed. . . . The operant situation is analyzed in terms of some simple response dimensions to provide a basis for the arithmetic model from which double-stimulus values are predicted.—*J. Arbit.*

4629. Leary, R. W. (U. Oregon) **"Spontaneous reversal" in the serial-discrimination reversal learning of monkeys.** *Canad. J. Psychol.*, 1962, 16(3), 228-233.—A serial-discrimination technique was employed for the presentation of pairs of multi-dimensional objects in the Wisconsin General Test Apparatus. After 1, 3, or 6 learning runs, up to 6 runs were given with the "correct" stimulus reversed. With either 3 or 6 runs in original learning there was a small but significant decrease in the efficiency of reversal learning.—*R. S. Davidson.*

4630. Pribram, Karl H., Gardner, Kenneth W., Pressman, Gerald L., & Bagshaw, Muriel. (Stanford U.) **An automated discrimination apparatus for discrete trial analysis (DADTA).** *Psychol. Rep.*, 1962, 11(1), 247-250.—"To overcome certain limitations of operant conditioning equipment, the DADTA was developed. Description of the general construction, actual use, and advantages are given."—*B. J. House.*

4631. Sutherland, N. S., Carr, A. R., & Mackintosh, J. A. (Oxford U., England) **Visual discrimination of open and closed shapes by rats: I. Training.** *Quart. J. exp. Psychol.*, 1962, 14(3), 129-139.—Rats were trained to discriminate between 2 pairs of shapes: in each pair one shape was "open," the other "closed." $\frac{1}{2}$ the animals were trained to discriminate between a pair of shapes which differed in their horizontal projections, the remainder between a pair which differed in their vertical projections. After being trained with both shapes exposed simultaneously, some rats were retrained to respond correctly when the positive and negative shapes were shown singly. The main findings were as follows: (a) Rats discriminated more readily between shapes whose horizontal projections differed than between shapes with differing vertical projections. (b) At the beginning of training rats exhibited a marked preference for the more open shape of the 2. (c) During simultaneous training, they learned to respond to the open shape more accurately than they learned to respond to the closed. (d) Rats learned to approach the positive shape rather than to avoid the negative. (e) Presence or absence of shock as punishment for a wrong response and massing or distributing of trials did not affect performance during learning.—*Journal abstract.*

4632. Sutherland, N. S., & Carr, A. E. (Oxford U., England) **Visual discrimination of open and**

closed shapes by rats: II. Transfer tests. *Quart. J. exp. Psychol.*, 1962, 14(3), 140-156.—Rats which had been trained to discriminate between an open and a closed shape were given 3 series of transfer tests. 2 main methods of giving the tests were used: (a) successive transfer tests. Transfer shapes were shown singly, and the animal responded by going towards the shape or to the opposite side of the apparatus to that on which the shape was exposed. In one series of tests using this method, 20 different shapes were shown. (b) Simultaneous transfer tests. Transfer shapes were shown in pairs, and the animal responded by approaching one member of the pair. In 1 series of tests given by this method, every possible pair which could be drawn from the 20 shapes used in the successive method was presented. On the basis of the tests, it was possible to rank the shapes in order of similarity to the original training shapes for rats. It was found that results obtained by the 2 methods were consistent: the rank order correlation found between the 2 rank orders obtained with the different methods was 0.87. The 1st method was shown to be the more satisfactory.—*Journal abstract.*

4633. Zakher, IU. IA. (USSR Acad. Sciences) *Differentsirovanie svetovyykh usloviykh razdrzhitelei pri odnovremennom i posledovatel'nom ikh pred'yavlenii u primatov.* [Discrimination of light CS in primates under conditions of simultaneous and successive presentation.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 95-102.—4 monkeys were trained to discriminate between light circles of different diameters. Reactions were reinforced by food. When stimuli were presented simultaneously, the number of correct responses amounted to 91-95%. In the case of successive presentation, disinhibition of discriminations often took place. This could have been due to greater difficulty in differentiating successive stimuli, and to the fact that in the case of simultaneous presentation of stimuli a direct connection is preserved between the stimuli and the reinforcement.—*A. Cuk.*

Avoidance

4634. Cadwallader, T. C., & Harker, G. S. (USA Medical Research Lab., Fort Knox, Ky.) *The differentiation of an avoidance response from an escape response: A note and circuit.* *USA Med. Res. Lab. Rep.*, 1962, No. 546. ii, 4 p.—This report describes the logic of and a circuit for differentiating an avoidance response from an escape response. An electronic gate has been developed which, in conjunction with an electronic timer, times the duration of electric shock which an animal actually receives. By noting the presence or absence of shock it is possible to differentiate an escape response from an avoidance response.—*USA MRL.*

4635. Fowler, Harry, & Trapold, Milton A. (U. Pittsburgh) *Escape performance as a function of delay of reinforcement.* *J. exp. Psychol.*, 1962, 63(5), 464-467.—Rats were trained to run from an alley where they received a continuous electric shock to a goal box where shock was terminated at 1 of 6 time delays. The results indicated that speeds were slower the greater the delay of shock termination at the goal: this effect was greater for speeds in the alley section of the runways and less for speeds at the start section. "These results are analogous to

those obtained in runway situations where delayed appetitive rewards have been employed and, as such, they indicate, along with those findings previously reported, that similar behavioral laws underlie both appetitive and escape conditioning."—*J. Arbit.*

4636. Hoffman, Howard S., & Fleshler, Morton. (Pennsylvania State U.) *The course of emotionality in the development of avoidance.* *J. exp. Psychol.*, 1962, 64(3), 288-294.—". . . rats were trained to press a bar to avoid shock while they were concurrently engaged in pressing a plate for food. The course of emotionality was tracked by assessing the several levels of suppression of ongoing plate presses during each of the various phases of the acquisition process. The results revealed a complex relationship between the level of performance on avoidance and the several concurrent indices of emotionality. In general, the results support the dual process hypothesis that conditioned emotionality controlled by the warning signal provides motivation for the avoidance response, while a decline in emotionality (with the offset of the signal) reinforces the response. The results also suggest that the lingering motivational aftereffects of aversive stimulation play an important role in the early phases of acquisition."—*J. Arbit.*

4637. Karas, George G., Willham, Richard L., & Cox, David F. (Iowa State U.) *Avoidance learning in swine.* *Psychol. Rep.*, 1962, 11(1), 51-54.—"Three-week-old pigs [N=60] reach a level of performance in avoidance learning [in a shuttle-box] comparable to that found in other species. Spacing sets of trials by days increased the performance over massed practice. Thirty trials, 10 per day, gave a convenient measure of learning, sufficiently sensitive to individual differences for genetic analysis."—*B. J. House.*

4638. Tokarenko, I. I. (Medical Inst., Donets, USSR) *Izmenenie dykhatel'nogo komponenta dvigatel'noi oboronitel'noi uslovnoi reaktzii pri razlichnykh funktsional'nykh sostoianiiakh dykhatel'nogo tsentra.* [Change of the respiratory component of the conditioned motor defensive reaction under various functional conditions of the respiratory center.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 128-134.—Defense CR and discriminatory reactions to sound and light stimuli were developed in 6 dogs. It appears that the nature of the respiratory component of the defense CR depends upon the initial functional state of the respiratory center. Positive CS and electrical US result in an increased amplitude and rate of respiration in cases of initial slow and slight breathing. The same stimulation exerts an inhibitory influence in cases of initial fast and deep breathing. With a high functional activity of the respiratory center transmarginal inhibition takes place.—*A. Cuk.*

4639. Vatsuro, E. G., & Shepeleva, V. K. (USSR Acad. Sciences) *O vzaimodeistvii zapakhovogo i zvukovogo, a takzhe zapakhovogo i svetovogo komponentov odnovremennnykh kompleksnykh razdrzhitelei.* [Interaction of olfactory and acoustic as well as olfactory and visual components of simultaneous complex stimuli.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 103-109.—Defensive CRs, using electric shock as reinforcement, were estab-

lished in 4 dogs in response to complex stimuli. When the reflex was formed to a simultaneous complex stimulus consisting of olfactory and acoustic components, both components possessed the same signal activity. When the CR was established to an olfactory stimulus first, the olfactory signal predominated. This is related to the phenomenon of "leading afferentation." When the reflex is a reaction to an olfactory-visual combination, the complex is perceived as a single stimulus.—*A. Cuk.*

Reinforcement

4640. Armus, Harvard L., De Voy, W. Edwin; Eisenberg, Terry, & Schroeder, Stephen R. (U. Toledo) Effect of primary reinforcement schedule on secondary reinforcement strength with continuous secondary reinforcement during training. *Psychol. Rep.*, 1962, 11(1), 203-208.—"Two groups of rats [N = 118] were trained on a lever-pressing task, one group on a CRF schedule of food reinforcement and one on a FR-6 schedule. For both groups, each lever response produced a 2-sec. combination light-sound stimulus. . . . The animals were then tested in a two-lever situation in which pressing one lever produced the light-sound stimulus and pressing the other lever did not." Failure to obtain group differences was contrasted with a previous finding that FR training produced greater secondary reinforcement effects with a 100% association of secondary and primary reinforcement instead of the 17% association of the present study.—*B. J. House.*

4641. Capaldi, E. J., & Hart, Dick. (U. Texas) Influence of a small number of partial reinforcement training trials on resistance to extinction. *J. exp. Psychol.*, 1962, 64(2), 166-171.—". . . rats were trained to traverse a straight alley under either continuous, irregular, or single alternation of reward. In the initial experiment, which employed 27 training trials, the continuous group was found to be least resistant to extinction. The single alternation group was found to be more resistant than the irregular one. Previous experiments have shown that following a moderate number of training trials the alternation and irregular groups are about equally resistant to extinction, while following considerable training the alternation group is less resistant than the irregular one. In the second experiment, extinction training was given following only 18 training trials. While the irregular and continuous groups failed to differ in extinction, the single alternation group showed the typical partial reinforcement effect. The findings were discussed in connection with the Hull-Sheffield aftereffects hypothesis."—*J. Arbit.*

4642. Collier, George (U. Missouri) Some properties of saccharin as a reinforcer. *J. exp. Psychol.*, 1962, 64(2), 184-191.—"The relations between concentration, volume per reinforcement, interval between reinforcement, degree and kind of deprivation, and the rate of responding for saccharin solutions in the Skinner box were explored. . . . The relations found for saccharin were similar to those found for sucrose. The implications of the differences between saccharin and sucrose, e.g., osmotic and metabolic, were examined for an account of these relations in terms of the view that there is a threefold locus of events governing the rate of responding, the proximal reinforcing stimuli, the momentary ingestive

load, and the nutritive condition of the animal."—*J. Arbit.*

4643. Cotton, John W., Jensen, Glen D., & Lewis, Donald J. (U. California, Santa Barbara) Spontaneous recovery interval as a factor in reacquisition of T maze behavior. *J. exp. Psychol.*, 1962, 63(6), 555-562.—Albino rats were given pre-training, acquisition and extinction trials in a single-unit T maze. Different groups received spontaneous recovery periods ranging from 1 min. to 9 days prior to a reacquisition session. Neo-Hullian equations were used to fit mean running speeds and percentage of correct responses for each group on each trial.—*J. Arbit.*

4644. Egger, M. David, & Miller, Neal E. (Yale U.) Secondary reinforcement in rats as a function of information value and reliability of the stimulus. *J. exp. Psychol.*, 1962, 64(2), 97-104.—In a situation in which more than one stimulus predicts primary reinforcement it was hypothesized that the more informative stimulus will be the more effective secondary reinforcer and that a redundant predictor of primary reinforcement should not acquire secondary reinforcement strength. Using rats in a bar press situation with appropriate controls for pseudoconditioning, unconditioned rates of pressing and for any activating effect of the stimuli, the hypotheses were supported. The findings are noted as being in agreement with the discriminative stimulus hypothesis of secondary reinforcement.—*J. Arbit.*

4645. Ehrenfreund, David, & Badia, Pietro. (Adelphi Coll.) Response strength as a function of drive level and pre- and postshift incentive magnitude. *J. exp. Psychol.*, 1962, 63(5), 468-471.—"In an attempt to ascertain (a) the function describing how D and K combine and (b) the effect of incentive magnitude shifts as a function of D, speed measures were obtained on four groups of rats involving two drive levels and two reward levels. After 90 trials on the original reward level, the reward of each group was shifted to that of the other for 25 additional trials. Statistical analyses revealed a significant interaction ($P = .05$) between D and K, indicative, not of a multiplicative function but of a negatively accelerated one such as exponential addition." Other findings are discussed in terms of the Crespi effect and a hypothetical anticipatory emotional response mechanism.—*J. Arbit.*

4646. Gonzales, R. C., Eskin, Rochelle M., & Bitterman, M. E. (Bryn Mawr Coll.) Extinction in the fish after partial and consistent reinforcement with number of reinforcements equated. *J. comp. physiol. Psychol.*, 1962, 55(3), 381-386.—African mouthbreeders received food reward for striking a target. In 1 experiment, fixed interval, variable interval, and consistent schedules of reinforcement were used; in another experiment, with discrete trials, reward ratios of 100%, 50%, and decreasing lower percentage were compared. Within both studies, the number of reinforcements was equated across groups. Unlike studies in which number of trials are equated, the partial reinforcement groups here showed higher resistance to extinction. It is suggested that "the fish is much more influenced than the rat by sheer number of reinforcements."—*W. A. Wilson, Jr.*

4647. Hendry, Derek P. (Durham Coll., England) **The effect of correlated amount of reward on performance on a fixed-schedule of reinforcement.** *J. comp. physiol. Psychol.*, 1962, 55(3), 387-391.—The amount of reward rats received was determined by their terminal interresponse time on a fixed-interval schedule. Ss learned to wait longer before the final response if this produced a larger reward, or to produce a shorter final interresponse time when that earned more reward. The changes in performance "support the view of Ferster and Skinner that the important contingencies of reinforcement are those operating at the moment of reinforcement."—*W. A. Wilson, Jr.*

4648. Hill, Winfred F., Cotton, John W., & Clayton, Keith N. (Northwestern U.) **Effect of reward magnitude, percentage of reinforcement, and training method on acquisition and reversal in a T maze.** *J. exp. Psychol.*, 1962, 64(1), 81-86.—Using rats in a T maze, "acquisition of the correct response was faster for large reward, 100% reinforcement, and forced noncorrection method, with no interactions. Reversal was faster for large reversal reward, faster after 100% reinforcement with correction method than any other combination of percentage with method, and slower after 50% reinforcement with large acquisition reward than any other combination of percentage with acquisition magnitude. Acquisition by the correction method gave faster running during both acquisition and reversal. Running was faster with larger current reward both during acquisition by correction method and during reversal."—*J. Arbit.*

4649. Hulse, Stewart H. (Johns Hopkins U.) **Discrimination of the reward in learning with partial and continuous reinforcement.** *J. exp. Psychol.*, 1962, 64(3), 227-233.—"Fifty albino rats were given 60 training trials in a 15-ft. U shaped alley. They were reinforced with 600 licks of water from a drinking tube on 33%, 66%, or 100% of the trials. Half the partial Ss could lick on the dry drinking tube on nonreinforced trials; for the other half, the tube was blocked such that the Ss could neither see it nor lick it. . . . The data suggest that partial reinforcement produces a very powerful discrimination of reward stimuli in the goal box. This process may be a factor in experiments which have shown that stimulus variables correlated with the reward, such as its sweetness or size, have different effects if they are used with partial as compared with continuous reinforcement."—*J. Arbit.*

4650. Ison, James R. (U. Rochester) **Experimental extinction as a function of number of reinforcements.** *J. exp. Psychol.*, 1962, 64(3), 314-317.—"Six groups of rats received either 10, 20, 40, 60, 80, or 100 reward trials [N_g] followed by 80 non-rewarded extinction trials at five trials per day with an intertrial interval of 18 min. The mean numbers of trials to extinction criteria of 40 and 120 sec. were negatively related to N_g and running speed to early extinction was nonmonotonically related to N_g . These data were contrasted with those previously obtained in the Skinner box. In addition, the mean number of trials on which avoidance responses occurred in extinction was positively related to N_g and the mean number of trials to the first avoidance response was negatively related to N_g . These latter relationships

are consistent with interference theories of extinction which stress the acquisition of competing avoidance responses."—*J. Arbit.*

4651. James, W. T. (U. Georgia) **An apparatus for the investigation of an operant response for sham feeding versus direct stomach feeding in the dog.** *Psychol. Rep.*, 1962, 11(1), 67-70.—This report describes an apparatus for the automatic injection of food into the stomach of the dog via an esophageal fistula as the animal presses a lever in a large operant box. The tank consists essentially of two chambers separated by appropriate valves. One chamber holds 1500 cc. gruel, while the back chamber is used to place air pressure on the valves which force the gruel through a plastic tube to the dog's stomach. A solenoid cut-off valve controls the amount of food delivered to the animal as a lever is depressed. In some tests the plastic tube delivered food directly to a pan before the animal, in order to contrast the two methods of food intake."—*B. J. House.*

4652. Knarr, Frederick A., & Collier, George. (U. Missouri) **Taste and consummatory activity in amount and gradient of reinforcement functions.** *J. exp. Psychol.*, 1962, 63(6), 579-588.—"In two runway experiments the effects of jointly manipulating concentration of sucrose, volume per reinforcement, and amount of consummatory activity on starting and running speed were examined. Rate of acquisition and the terminal level of responding proved to be functions mainly of concentration and number of pellets offered. The relatively minor effects of tube size occurred in the early training trials and those of volume per reinforcement in the terminal trials. It was concluded that variations in consummatory activity are neither necessary nor even sufficient conditions for producing variations in acquisition and performance. The implications of the fact that the terminal gradient of running was a negative one whose steepness was a function of concentration and amount were explored."—*J. Arbit.*

4653. Lynn, Elizabeth, & Leary, R. W. (U. Oregon) **Reinforcement procedure and cue location in pattern discriminations of monkeys.** *Psychol. Rep.*, 1962, 11(1), 83-90.—6 rhesus monkeys were presented with a series of 6-trial pattern problems. The following significant findings are reported: (a) More errors were made when form alone was relevant than color alone. (b) More errors were made with patterns of 1 square in. than 3 square in., but placement of the small patterns on the upper, middle, or lower part of the stimulus card produced no effect. (c) Presentation of a single negative stimulus on the first trial produced better performance than a single positive stimulus or 2 positive or 2 negative stimuli. (d) Injection with promazine on $\frac{1}{2}$ the problems had no effect on learning.—*B. J. House.*

4654. Mintz, Donald E. (Princeton U.) **Force of response during ratio reinforcement.** *Science*, 1962, 138(Whole No. 3539), 516-517.—Sharp decline in response force after reinforcement and progressive force elevation over a sequence of unreinforced responses were observed for Ss in a fixed ratio lever-press situation. It is suggested that these systematic variations in force level may provide, through feed-

back, discriminable cues for behavioral regulation.—*Journal abstract.*

4655. Mountjoy, Paul T., Day, Edwin A., & Rogers, Curtis C. (Denison U.) Response decrement under continuous reinforcement as a function of effort. *J. scient. Lab. Denison U.*, 1960, 45, 124-128.—Rats were given massed trials in either a 4-ft. or a 13-ft. runway, with continuous water reinforcement. In Experiment 1, 12 Ss were given 15 trials every 12 hr. for 17 days and retested after a 2-week recovery period. Ss of both groups ran faster upon retesting. In Experiment 2, 12 Ss were given 15 trials every 24 hr. for 56 days and retested after a 15-day recovery period. There was no change in speed of running upon retesting. The results were discussed in relation to other studies, and it was suggested that some mechanism other than conditioned inhibition was operating.—*Author abstract.*

4656. Roberts, Carl L. (Colorado Coll.) Stimulus and stimulus-change factors governing the free operant rats. *J. comp. physiol. Psychol.*, 1962, 55(3), 375-380.—Illumination of the cage was used as reinforcement for lever pressing in rats. Although response rate usually decreases within session in such a situation, repeated presentations of the illumination not produced by the Ss led to a recovery in subsequent lever pressing, a recovery equal to that of Ss given no reinforcements in the interval. This is thought to rule out explanations of response decrement in terms of stimulus satiation, in favor of a reactive-inhibition formulation.—*W. A. Wilson, Jr.*

4657. Sandler, Jack. (VA Hosp., Coral Gables, Fla.) Reinforcement combinations and masochistic behavior: A preliminary report. *Psychol. Rep.*, 1962, 11(1), 110.—Bar-press response rate for liquid reinforcement was not appreciably reduced by the introduction of concurrent shock schedule (in 4 monkeys). Responding during an extinction phase with shocks but no liquid appeared to be increased by such training.—*B. J. House.*

4658. Schoonard, James, & Lawrence, Douglas H. (Stanford U.) Resistance to extinction as a function of the number of delay of reward trials. *Psychol. Rep.*, 1962, 11(1), 275-278.—"Three groups of animals [40 rats] were trained for 68 trials in a delay of reward situation. One group was delayed for 20 sec. on each of these trials before being allowed to enter the goal box for a reward pellet. The second group had 48 trials without delay followed by a block of 20 delay trials. The third group had all 68 trials without delay. It was found that resistance to extinction tended to be a linear, increasing function of the number of delay trials."—*B. J. House.*

4659. Snyder, Harry L. (Johns Hopkins U.) Saccharine concentration and deprivation as determinants of instrumental and consummatory response strengths. *J. exp. Psychol.*, 1962, 63(6), 610-615.—3 levels of saccharine concentration (C) and 4 levels of food and water deprivation (D) were combined factorially to produce 12 groups of 10 male albino rats each. Running speed in a straight alley increased with both D and C but the interaction was not significant. This finding supports Spence's additive relationship as opposed to Hull's multiplicative relationship of drive and K. The monotonic relationship between speed and rate of licking for

the C variable supports a consummatory response theory of reinforcement; the negative relationship between these response measures for the D variable shows the limitations of such a theory.—*J. Arbit.*

4660. Solomon, Stuart. (U. Connecticut) Effects of variations in rearing, drive level, and training procedure on performance in probability learning tasks. *Psychol. Rep.*, 1962, 10, 679-689.—2 groups of rats (N=46) were reared under either a C environment (stable, with food and water always available) or a V environment (random variability in availability of food, water, sex, etc.). "A factorial design was used to further subdivide the C and V treatments into groups tested under early (45) days and late (90 days) duration of rearing, high and low drive levels, and correction and noncorrection training procedure. Each S was run . . . on a . . . T maze with a 75%-25% schedule of partial reinforcement." Both drive level and rearing procedures produced significant main effects. Asymptotic response probability of the low drive groups tended to match reinforcement schedule, while high drive increased responding to the 75% side. C-environment rats had higher asymptotic responding to the 75% side than C-environment rats even after a covariance analysis which removed the effect of drive level. Results were discussed in relation to Goodnow's and Flood's hypotheses.—*B. J. House.*

4661. Theios, John. (Stanford U.) The partial reinforcement effect sustained through blocks of continuous reinforcement. *J. exp. Psychol.*, 1962, 64(1), 1-6.—Rats were run in a runway on partial reinforcement. Then different numbers of continuously reinforced trials were interpolated between the partial reinforcement condition and extinction. The results question the adequacy of the discrimination hypothesis that the partial reinforcement extinction effect results from difficulty in discriminating the transition from training to extinction.—*J. Arbit.*

4662. Wagner, A. R., & Miller, N. (Yale U.) Choice behavior and resistance to extinction. *Psychol. Rec.*, 1962, 12, 105-108.—The basis for this study rests on a suggested general relationship from the literature between choice and extinction behavior, namely, that if S prefers one of 2 reinforcing goal events in a simple choice situation, that particular event would produce less resistance to extinction than the nonpreferred goal. The present study dealt with the relationship in partial reinforcement with large rewards vs. small rewards. Data are contrary to the stated hypothesis. Results are interpreted as being consistent with a theoretical position which stresses, "the relative independence of the incentive value of a goal event in the degree to which it encourages learning to approach in the presence of non-reinforcement cues."—*R. J. Seidel.*

Motivation & Learning

4663. Batsuro, E. G., & Zakher, YU. Y. (Inst. Evolutionary Physiology, Acad. Sciences, USSR) Refleks na otnoshenie velichin spetsificheskikh (pischevykh) usloviykh razdrashiteley u sobak. [Response to the relation of size of specified conditioned (food) stimuli in dogs.] *Dokl. Akad. Nauk SSSR*, 1962, 144(1), 234-237.—An (instrumental) conditioned reflex was elaborated in 3 dogs with the size of a food morsel acting as the discriminative

stimulus. The S was given either a 1.5 gram piece of meat or a 3 gram piece. If the dog received the 1.5 gram piece he could receive another morsel by going to the opposite end of the experimental room. No additional reinforcement followed the 3 gram piece. After training on this discrimination, various tests of generalization were introduced. Generalization tests to another type of food were positive for such things as sausage for one of the dogs but not for cheese or honey cake. Generalization to larger pieces of meat, 6 or 9 grams, was positive but such tests caused a breakdown of discrimination of the original 3 gram size.—*H. Pick.*

4664. **Berlyne, D. E.** (U. Toronto) **Note on food deprivation and extrinsic exploratory responses.** *Psychol. Rep.*, 1962, 11(1), 162.—A finding by Wehling and Prokasy (see 37: 2976) is interpreted as support for the theory that extrinsic exploratory responses are reinforced by reduction of conflict, as distinguished from reduction of uncertainty.—*B. J. House.*

4665. **Howard, Thomas C., & Young, Francis A.** (U. Tulsa) **Conditioned hunger and secondary rewards in monkeys.** *J. comp. physiol. Psychol.*, 1962, 55(3), 392-397.—3 groups of monkeys were exposed to a flashing light for $\frac{1}{2}$ hr. a day for 47 days. 1 group received this CS before feeding, 1 group during feeding, 1 group after feeding. Subsequent testing under satiation displayed no group differences attributable to the CS on either a previously learned food-vendor response or the learning of a new response to obtain washers which could be used in the food vendor. It is concluded that there is no evidence for the conditioning of the food drive.—*W. A. Wilson, Jr.*

4666. **Marx, Melvin H., & Pieper, W. A.** (U. Missouri) **Acquisition of instrumental response as a function of incentive contrast.** *Psychol. Rep.*, 1962, 10, 635-638.—A new type of incentive-shift procedure was used in which "all experimental Ss were fed the larger incentive (64% sucrose in water) directly on one day, and were then allowed to barpress for either 32% sucrose (Group 64/32) or 8% sucrose (Group 64/8) on the following day. Control groups were given only 32% sucrose (Group 32/32) or 8% sucrose (Group 8/8). A total of 32 female albino rats was divided into the four groups and given 12 daily 10-min. sessions [altering direct feeding with barpress sessions]. All barpresses were reinforced." The 8/8 group was superior to the 32/32 group. "The expected undershooting tended to occur in the 64/8 Ss, but an unexpected overshooting—a statistically reliable superiority in acquisition—occurred in the 64/32 Ss."—*B. J. House.*

4667. **Thomas David R.** (Duke U.) **The effects of drive and discrimination training on stimulus generalization.** *J. exp. Psychol.*, 1962, 64(1), 24-28.—Drive level had a beneficial effect upon stimulus generalization in the pigeon. Discrimination produced a steepening of the postdiscrimination gradient, a lowering of the gradient in the region of S—, and a shift of the central tendency from the region of S+ in the direction away from S—, the amount of shift varying inversely with the (S+, S—) difference. This occurs for all 3 levels of drive. Generalization gradients during the course of discrimination training reveal that the mean of the gradient shifts in a nega-

tively accelerated manner as a function of the amount of discrimination training.—*J. Arbit.*

COMPLEX PROCESSES

4668. **Wenner, Adrian M.** (U. California, Santa Barbara) **Communication with queen honey bees by substrate sound.** *Science*, 1962, 138(Whole No. 3538), 446-447.—A caged queen honey bee, installed in observation hive which already contained a virgin queen, piped in response to artificial piping which was played to it through the substrate. The experiments which followed this observation provide the first direct quantitative evidence that sound, at least in the range of 600-2000 cycles per second, is perceived by honey bees and that information is transmitted through sound from one bee to another.—*Journal abstract.*

SOCIAL BEHAVIOR

4669. **Clark, Lincoln D.** (Coll. Medicine U. Utah) **A comparative view of aggressive behavior.** *Amer. J. Psychiat.*, 1962, 119(4), 336-341.—*Onychomys leucogaster*, a rodent found near Salt Lake City, was studied in the laboratory for its aggressive behavior. While believed to be "in part genetically determined," aggression was found to be completely suppressed or reinforced to various degrees and to a variety of stimuli.—*N. H. Pronko.*

4670. **Keenleyside, Miles H. A., & Yamamoto, Fred T.** (Fisheries Research Board, St. Andrews, New Brunswick) **Territorial behavior of juvenile Atlantic salmon (*Salmo salar* L.).** *Behaviour, Leiden*, 1962, 19(1-2), 139-169.—"The territorial behavior of young Atlantic salmon is described from observations made in the field and the laboratory. Six agonistic activities occur during the defence of territories; these are charging, nipping, chasing, frontal display, lateral display, and fleeing. . . . The causation of the six agonistic acts is discussed.—*A. Barclay.*

4671. **Rowley, Ian.** (Wildlife Survey, Canberra, Australia) **"Rodent-run" distraction display by a passerine, the superb blue wren *Malurus cyaneus* (L.).** *Behaviour, Leiden*, 1962, 19(1-2), 170-175.—"Distraction display as performed by the Superb Blue Wren, *Malurus cyaneus*, takes the form of a true 'rodent-run' and is stimulated by the alarm call of the young; this display is described and illustrated. Both male and female perform, although the coloring of only the latter resembles that of a small mammal. The display in other, related, species is discussed, and it is postulated that it may be a generic characteristic developed before sexual dimorphism and speciation were manifest."—*A. Barclay.*

4672. **Schastný, A. I., & Firsov, L. A.** (Acad. Sciences USSR) **Fiziologicheskii analiz sredstv vzaimodeistviya u shimpanze v gruppom eksperimente.** [Physiological analysis of the means of interaction with chimps in a group experiment.] *Dokl. Akad. Nauk SSSR*, 1961, 141(5), 1264-1266.—Social interaction between 2 chimps was conditioned by using the response of one chimp as the CS for a response of the other chimp. One chimp (Roza) had a vigorous appetite. She was conditioned to put a token into a receptacle in order to receive food. The other chimp (Lada) was very curious. She was conditioned to put a token into a receptacle to receive a

toy. The conditioned interaction consisted of the following chain of events: when Lada was given a hexagonal token she dropped it into the receptacle. This was the signal for Roza to place a toy in the receptacle which in turn served as a signal for Lada to place a piece of food in the receptacle. Then the food was delivered to Roza and the toy to Lada. The delayed nature of reinforcement necessitated a large number of shaping trials. Experimental operations such as giving Roza food before the experiment or depriving Lada disrupted this chain.—*H. Pick.*

4673. Stamm, Roger A. (Zoological Inst., Basil) *Aspekte des Paarverhaltens von Agapornis personata Reichenow.* [Aspects of the pair behavior of the East African parrot.] *Behaviour, Leiden*, 1962, 19(1-2), 1-56.—"The east African parrot *Agapornis personata* Reichenow lives in groups of 20 to 30 individuals. The paper describes some aspects of its pair behavior, while later papers will deal with the group dynamics of the species."—*A. Barclay.*

4674. Stokes, Allen W. (Utah State U.) *Agonistic behavior among blue tits at a winter feeding station.* *Behaviour, Leiden*, 1962, 19(1-2), 118-138.—A behavioral analysis of encounters of the blue tit with one another, with descriptive accounts of the separate elements of attack, escape, or staying behavior. Attack and escape behavior decreased in frequency from January through March, perhaps as a result of habituation to the feeding station situation. The behavior elements observed seemed to have strong signal values, with interactions being elicited as a function of the perceived signal; i.e., attack behavior in one bird elicits escape behavior in another. However, probabilities of one specific behavior following a particular combination of other behaviors changed with season and rendered prediction of behavior difficult.—*A. Barclay.*

ABNORMAL BEHAVIOR

4675. Mering, T. A. (Brain Inst., USSR Acad. Medical Sciences) *K voprosu o nevrozakh, poluchennykh v usloviakh dvigatel'noi metodiki.* [Neuroses obtained by means of motor methods.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 481-488.—Several positive and negative CRs to a variety of stimuli were established in 23 dogs both before and after a brain operation in the area of the auditory analyzer. Neurotic deviations could not be produced in Ss either by means of collision of the excitatory and inhibitory processes or by means of overstraining the inhibitory process. For dogs with a weakened nervous system, resulting from brain operations, the extinction of the action of auditory stimuli is a difficult task which is often accompanied by various neurotic deviations including epileptic seizures and the appearance of ulcers.—*A. Cuk.*

4676. Sen, N. N. *An objective study of experimental neurosis: III. After effects of experimental stress.* *Psychol. Stud. Mysore*, 1962, 7(2), 38-42.—No generalized and persistent aftereffects of the experimental stress were observed in rats on a carefully selected battery of tests. Among the 15 pretest measures, only 2, hiding and general ability, appeared to be associated with types of reaction to the experimental stress.—*U. Pareek.*

DEVELOPMENTAL PSYCHOLOGY

4677. Baldwin, A. L. (Cornell) *Indications and contraindications for the longitudinal strategy.* In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology Vol. 3. Child and education* (see 37: 4118). Pp. 42-49.—Traditional forms of longitudinal studies have not produced impressive results. 3 ways of dealing with the unanticipated environmental stresses affecting the study are discussed and a strategy suggested.—*B. T. Jensen.*

4678. Bronfenbrenner, Urie. (Cornell U.) *The role of age, sex, class, and culture in studies of moral development.* *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 3-17.—The acquisition of values and character as a function of age, sex, class, and culture is discussed.—*S. A. Walters.*

INFANCY

4680. Apgar, V., & James, L. S. (Presbyterian Hosp., N. Y.) *Further observations on the newborn scoring system.* *Amer. J. Dis. Children*, 1962, 104(4), 419-428.—A report of recent clinical and research applications of the Apgar score including a discussion of its use for predicting later mental development.—*A. B. Warren.*

4681. Bartoshuk, A. K. (Brown U.) *Human neonatal cardiac acceleration to sound: Habituation and dishabituation.* *Percept. mot. Skills*, 1962, 15(1), 15-27.—Human neonatal cardiac acceleration to sound was repeatedly elicited in order to study the response decrement across trials. It was suggested that fatigue cannot account for the response decrement across trials. Instead, the data favor interpreting the response decrement as selective habituation which probably represents a form of discrimination learning.—*W. H. Guertin.*

4682. Caldwell, Bettye M. (State U. New York, Syracuse) *The usefulness of the critical period hypothesis in the study of filiative behavior.* *Merrill-Palmer Quart.*, 1962, 8(4), 229-242.—The critical period hypothesis has served behavior theory as an orienting framework and has proved useful in the study of human infants. Certain refinements are discussed. (39 ref.)—*E. L. Robinson.*

4683. Dargassies, S. Sainte-Anne. (Paris, France) *The first smile.* *Develpm. Med. child Neurol.*, 1962, 4(5), 531-533.—The developmental connotation of the time of appearance of the 1st smile is discussed.—*T. E. Newland.*

4684. Holden, Raymond H., & Solomons, Gerald. (Child Development Study, Providence, R. I.) *Relation between pediatric, psychological, and neurological examinations during the first year of life.* *Child Develpm.*, 1962, 33(3), 719-727.—"This study correlated the results obtained between a 4-month pediatric examination, an 8-month psychological ex-

amination, and a 12-month neurological examination on 100 infants. . . . Each child was classified independently at each age level as 'Normal,' 'Suspicious,' or 'Abnormal' on the basis of mutually agreed on criteria. Correlations between examinations ($r = .61, .60, .53$) were all significant beyond the .01 level. Mental and motor scores from the 8-month examination accounted for up to 71 per cent of the variance at the 8-month examination and correlated highly with the finding of neurological deficit at 12 months of age ($r = .66$ and $.77$).—*W. J. Meyer.*

4685. Leuba, Clarence. (Antioch Coll.) **Relation of stimulation intensities to learning and development.** *Psychol. Rep.*, 1962, 11(1), 55-56.—To account for "the development of specific behaviors out of the random general behavior of the human infant" the principle is proposed and discussed that "those actions are strengthened and repeated which are accompanied or followed by over-all stimulation within a middle band of optimal intensities." The theory is related to definitions of reward and punishment, pleasantness and unpleasantness, and to the distinction between instrumental and classical conditioning.—*B. J. House.*

4686. Rossier, A. (Paris, France) **The future of the premature infant.** *Develpm. Med. child Neurol.*, 1962, 4(5), 483-487.—On the basis of a study of 156, of a potential 175, premature infants, examined between the ages of 4 and 7 years, "80% were normal in motor development and 78% were normal in mental development." With the improvement in dealing with retrolental fibroplasia, these figures should be improved, although there still remains the problem of the cerebral palsies.—*T. E. Newland.*

4687. Tonkova-Iampol'skaia, P. V. (Lvov, USSR) **K voprosu izucheniia fiziologicheskikh mekhanizmov rechi.** [Study of physiological mechanisms of speech.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 82-87.—An electro-acoustic analysis was made of cries of 18 neonates (age 1-6 days) to determine the spectral composition of sounds and the main physical parameters of the infants' sound intonation. Conclusion was drawn that a neonate's cry has no cortical control as yet and that the communicative aspect of the cry is not yet of the proper speech nature. The cry is of auto-oscillating nature without elements of cortical control.—*A. Cuk.*

CHILDHOOD

4688. Alon, Shmuel. **Hayeled, seviavto vehinukho.** [The child, his education and environment.] Tel Aviv, Israel: Yavneh, 1961. 254 p.—The 3 positive as well as negative elements shaping the child's personality have to be analyzed: the family, the school, and the child's inborn features. This volume "deals with the child's organisms and its inner powers stimulating his mental and biological growth." A textbook intended for "students of teacher training colleges, teachers, parents, physicians . . . based on 100,000 observations, questionnaires, and various investigations of children in Israel from the early childhood until the adolescence." All of the topics discussed are education-oriented.—*H. Ormian.*

4689. Braun-Lamesch, Marie-Medeleine. **Le rôle du contexte dans la compréhension du lan-**

gage chez l'enfant. [The role of context in the child's comprehension of language.] *Psychol. Franc.*, 1962, 7(3), 180-189.—The purpose was to study as a function of age the change in the child's ability to utilize context in order to obtain meaning. 120 children aged 5-9 years were orally presented with 6 series of 4 phrases each. In each phrase, an artificial word common to the series replaced some other word. S's task was to determine the meaning of the artificial word. Results indicated an increase with age in correct identifications. Some words were more easily identified at all ages.—*C. J. Adkins.*

4690. Crandall, Vaughn J., Katkovsky, Walter, & Preston, Anne. (Fels Research Inst., Yellow Springs, O.) **Motivational and ability determinants of young children's intellectual achievement behaviors.** *Child Develpm.*, 1962, 33(3), 643-661.—Early-grade-school children's motivations and attitudes as related to their behavior in diverse intellectual achievement situations (time spent in intellectual activities, intensity of achievement striving, intelligence test performances, and reading and arithmetic achievement test performances) were assessed. There were few sex differences. Measures of n-ach and general manifest anxiety were unrelated to achievement, but several theory-dictated predictor variables (importance of intellectual competence, expectations of intellectual success) were useful predictors.—*W. J. Meyer.*

4691. Geber, M. (Centre de Santé Publique de la Region de Soissons) **Longitudinal study and psycho-motor development among Baganda children.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education.* (see 37: 4118). Pp. 50-60.—Several groups of children, some suffering from a type of malnutrition, have been studied. Environmental and developmental changes are described and compared with events in Europeanized families; e.g., apparent retardation in the Baganda at weaning compared to earlier precocity. (16 ref.)—*B. T. Jenson.*

4692. Jensen, Arthur R. (U. California, Berkeley) **Reinforcement psychology and individual differences.** *Calif. J. educ. Res.*, 1962, 13(4), 174-178.—The importance of studying the interaction of "content variables" (verbal, numerical, spatial, perceptual-motor, conceptual, etc.) with "conditions of learning" (distribution of practice, response pacing, intratask similarity, schedule reinforcement) in children of widely differing intelligence by means of a "multiple stimulus-response learning apparatus" is developed. The possibility of factoring out of the results certain possible contributing factors (habit strength, inhibition, interference, stimulus, and response generalization, behavior oscillation, and individual differences per se) is suggested.—*T. E. Newland.*

4693. Metraux, Rhoda. (American Museum Natural History) **Children's drawings: Satellites and space.** *J. soc. Issues*, 1961, 27(2), 36-42.—Analysis of children's drawings executed after the launching of the Sputniks indicated that there were 3 salient features: (a) the drawings of the satellites had some relationship to reality and were not rooted entirely in fantasy, even though the children had had relatively little direct exposure to information about

satellites at that time; (b) girls drawings were static rather than dynamic; and (c) the drawings were multi-dimensional, i.e., the satellites were drawn in relation to the earth, other planets, the sun, or other aspects of the solar system as well as in relation to the viewer.—*A. Barclay.*

4694. Otterstädt, H. *Untersuchungen über den Spielraum von Vorortkindern einer mittleren Stadt.* [Investigations on the play-space of suburban children close to a medium size town.] *Psychol. Rdsch.*, 1962, 13(4), 275-287.—Children who had access to rural play grounds and to city play grounds preferred without exception the natural play grounds. Favorite games between 9 and 14 are motion games played in groups not seldom covering an area of several kilometers. Girls generally do not use as much play ground space as boys.—*W. J. Koppitz.*

4695. Santos, John F., & Garvin, E. A. (Menninger Found.) *A further examination of the Schafer-Murphy effect.* *Amer. J. Psychol.*, 1962, 75(2), 259-264.—Since the original report of the effect (autism in visual figure-ground relationships), other studies have both confirmed and negated the findings. The present study employs isolated as well as interacting rewards and punishments. Ss were 26 boys and 22 girls, aged 10-13. Apparatus included a tachistoscope, projector, and 35-mm. slides picturing single faces or their ambiguous combinations. Over-all results suggest the absence of autistic effects. It is concluded that the Schafer-Murphy effect may be obtained only under highly specific conditions.—*R. D. Nance.*

4696. Rubin, B. M., Shantz, D. W., & Smock, C. D. (Purdue U.) *Perceptual constriction as a function of incentive motivation.* *Percept. mot. Skills*, 1962, 15(1), 90.—Children were shown rotated forms briefly in 3 concentric rings of distance from central focus. Their positioning of the forms on a reproduction board was significantly better on central tasks when incentive motivation was introduced; peripheral performance showed a decrement. Results would support the "narrowed attention" hypothesis governing perception under increased motivation.—*W. H. Guertin.*

4697. Tausch, Anne-Marie. (Brederbacher Str., Kettwig/Ruhr, Germany) *Verschiedene nicht-autokratische Verhaltensformen in ihrer Auswirkung auf Kinder in Konfliktsituationen.* [Various non-autocratic modes of behavior and their effect on children in conflict situations.] *Z. exp. angew. Psychol.*, 1962, 9(2), 339-351.—72 pupils between 11 and 14 were asked to judge the effectiveness of 4 teacher reactions to different pictured disturbances in class. The children considered 2 of the methods equally successful: (a) staring at the guilty ones without saying a word and (b) expression of understanding with an impersonal appeal for proper behavior. The other 2 methods: (c) explanation of the situation and (d) mere expression of understanding were not considered effective. Expert teachers evaluated the situations quite similarly, while student ~~selected~~ parents, though recognizing the effectiveness, only the staring method, did not see the effect associated with the understanding plus correction mental stress.—*Koppitz.*

4698. Zazzo, René. *Conduites et conscience: I. Psychologie de l'enfant et méthode génétique.* [Behavior and consciousness: I. Child psychology and genetic method.] Neuchâtel, Switzerland: Delachaux & Niestlé, 1962. 316 p.—In this volume the author collected some of his article which he previously published in various journals. A survey of the development of child psychology in the 20th century and an appraisal of Binet's work are followed by articles on: (a) the child's development during the 1st 3 years; (b) the psychology of the French child in comparison with the American child; (c) motor behavior with emphasis on lefthandedness, for which permissiveness is recommended; (d) the genesis of self-awareness and the influence of the attitudes of the parents and the cultural environment; and (e) the problem of set developmental stages with special reference to the theories of Tanner and Piaget: rigidity should be avoided. For the investigation of the differential psychology of the sexes at the preschool level, the author invented the "bestiary" test in which the child is asked with which animals he would identify himself. He is also questioned about his preferences for his own or the other sex and the developmental stages of life, i.e., his actual age, infancy, or adulthood.—*M. Haas.*

4699. Zinchenko, V. P., Ruzskaia, A. G., & Tarakanov, V. V. (RSFSR Acad. Pedagogical Sciences) *Sravnitel'nyi analiz osiaziiani i zreniia. Soobshchenie IX. Osobennosti dvizhenii glaza u detei doskol'nogo vozrasta v protsesse fiksatsii.* [Comparative analysis of touch and vision. Communication IX. Characteristics of eye movements in preschool children during fixation.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 81-84.—12 children (aged 3-7) had their eye movements photographed while they were fixating a black point on a white screen. The main findings were: (a) all Ss showed a great amount of eye movements; and (b) a reduction in eye movements and an increase in fixations took place only at the age of 6-7.—*A. Cuk.*

Learning

4700. Biriukov, D. A., Shliafer, T. P., & Iakovleva, M. I. (USSR Acad. Medical Sciences, Leningrad) *Uslovnoreflektornye izmeneniia dykhanii na fone sonnogo tormozheniia.* [Respiratory changes in the CR on the background of sleep inhibition.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 22-29.—Respiratory and cardiac reflexes of 25 children (age 4 months to 4 years) and 17 kittens were studied under stimulation of sound, touch and smell. It was found that in very young children and kittens respiratory changes are easily conditioned during light sleep and do not substantially differ from those during wakefulness. In children over 1 year, the CR cannot be formed because of deeper sleep.—*A. Cuk.*

4701. Degtiar', E. N. (USSR Acad. Sciences) *Sravnitel'naia kharakteristika fiziologicheskikh uslovi pri vyrabotke stereotipa pervoi vtoroi signal'noi sistemakh.* [Comparative characteristics of physiological conditions during the formation of a stereotype in the first and second signal system.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(1), 63-68.—Blinking reflex to a combination of visual and auditory stimuli was established in 37 children (age from

1 year 8 months to 3 years, and from 6 to 7 years). It was found that children respond to all complications and simplifications of a formerly established stereotype as well as to a new stereotype. In the younger group of Ss no generalization was obtained during the elaboration of a stereotype of verbal stimuli. Generalization was possible with the older group of Ss.—*A. Cuk.*

4702. Guzhakovskii, A. A. (Central Research Inst. Physical Culture, Moscow, USSR) *Izmeneniia vysshei nervnoi deiatel'nosti vospitannikov nachal'nykh klassov shkoly-internata v techenie dnia i vliianie na nee aktivnogo otdykha v vide podvizhnykh igr i fizicheskikh uprazhnenii.* [Changes of higher nervous activity in boarding school pupils and effect of outdoors games and physical exercises.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12 (3), 465-471.—Motor CRs to light were developed in 18 pupils of the 3rd grade. Conditioning took place 4 times a day, before and after classes, before and after homework. Results show that school work not only affects higher nervous activity during the day but it changes its nature during the whole week. Particularly deep changes in terms of transmarginal inhibition set in during the 2nd ½ of the week. When games were introduced, excitatory processes were strengthened. These games were particularly beneficial when introduced after classes and before dinner.—*A. Cuk.*

4703. Kass, Norman. (U. Minnesota) *Resistance to extinction as a function of age and schedules of reinforcement.* *J. exp. Psychol.*, 1962, 64(3), 249-252.—Using a simulated slot machine, 216 children at CA 4, 6, 8, and 11 received reinforcement on either 0, ¼, ½, ¾, or all of the trials of a 30-trial acquisition period. Extinction was continued until S wished to stop or until 370 extinction responses had been made. Decrease in extinction responses was found with increasing percentages of reinforcement. The fewest trials to extinction was at CA 4 and the most at CA 8. There was no interaction between CA and percent reinforcement.—*J. Arbit.*

4704. Klausmeier, Herbert J., & Check, John. (U. Wisconsin) *Retention and transfer in children of low, average, and high intelligence.* *J. educ. Res.*, 1962, 55(7), 319-322.—Groups of 29 problems were set up at 3 main levels of difficulty, one level for each IQ group of 20 boys and 20 girls in 5th grade. When children of low, average, and high intelligence receive learning tasks graded appropriately to their levels of achievement, they retain equally well to new situations of appropriate difficulty.—*F. Goldsmith.*

4705. Kol'tsova, M. M. (Pavlov Inst. Physiology, USSR Acad. Sciences) *Osobennosti formirovaniia sistem vremennykh svyazei vo vtoroi signal'noi sisteme.* [Characteristics of the formation of systems of temporal connections in the second signal system.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 450-456.—Ss were 24 children (age 4-5) who were conditioned to react to different combinations of visual stimuli (lights and the word "light" were used). The purpose was to clarify the role of the verbal factor in the generalization of direct stimuli. Temporal connections can be of 2 types: (a) sensory when 2 stimuli are combined without any reinforcement

and (b) combinations of the CS and US. Results show that generalization of direct stimuli is possible only on the basis of systems of temporal connections of both types. This holds also for the verbal factor.—*A. Cuk.*

4706. Longstreth, Langdon E. (U. Southern California) *Incentive stimuli as determinants of instrumental response strength in children.* *J. comp. physiol. Psychol.*, 1962, 55(3), 398-401.—Preschool children were given trials in a 14-ft. runway situation; a red light and a blue light were each presented on ½ the trials, no reward was given. Then, candy was presented to the Ss in the presence of the red light, but not the blue. When again placed in the runway, Ss ran faster when the red light was on, "supporting either a motivational or associative interpretation of the role of reward expectations in the instrumental reward situation."—*W. A. Wilson, Jr.*

4707. Lovell, K., Kellett, V. L., & Moorhouse, E. (U. Leeds, England) *The growth of the concept of speed: A comparative study.* *J. child Psychol. Psychiat.*, 1962, 3(2), 101-110.—10 normal Ss at each age from 5 to 10 years were compared with 10 subnormal Ss from each age group of 10, 12, 14, and 15 years on 10 Piaget-type experiments assessing (a) intuition of speed, (b) relations of speeds in synchronous movements, (c) relative speeds, and (d) conservation of uniform speeds. The findings support Piaget's results of growth in understanding these concepts and indicate that few subnormal children have such understanding.—*J. M. Reisman.*

4708. Menchinskaya, N. A. (Acad. Pedagogical Science, Moscow, USSR) *Problem solving studies.* In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 140-153.—Children in Grade 3 were required to solve arithmetic problems after having 1 of 2 kinds of training or none. In another experiment children were asked to distinguish geometrical figures. Results are discussed as illustrative of questions concerning problem solving.—*B. T. Jensen.*

4709. Palermo, David S. (U. Minnesota) *Mediated association in a paired-associate transfer task.* *J. exp. Psychol.*, 1962, 64(3), 234-238.—"An experiment was conducted to study facilitation and impairment of performance as a function of mediated associations in a modified A-B, A-C transfer paradigm. Children in Grades 3, 4, 5, and 6 were required to learn two lists of six paired associates composed of six stimuli and three responses. In List 2, the pairs were arranged so that learning could be facilitated by mediated associations or impaired by mediated associations. . . . The results indicated that the condition designed to produce facilitation through mediated associations led to superior performance when compared with the condition designed to produce impairment through mediated associations. Performance on the control pairs was superior, however, to that of both of the mediation conditions."—*J. Arbit.*

4710. Repina, T. A. (Inst. Psychology, RSFSR Acad. Pedagogical Sciences) *O nekotorykh metodikakh izucheniia zvukovysotnoi chuvstvitel'nosti u detei doskol'nogo vozrasta.* *Soobshchenie III. Opyt razrabotki metodiki, sposobstvuiushchei formirovaniu u detei differentsirovannogo zvukovysotnogo razlichia tembral'no okrashennykh tonov.*

[Some methods for analyzing sound-pitch sensitivity in preschool children. Communication III. A technique for developing in children a differentiated pitch discrimination of tones of different timbres.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 6, 55-60.—40 children aged 3-7, whose DL has been previously determined, were subjected to training in discriminating tones of different timbres under game conditions (tones were emitted by 7 teddy-bears). When they were retested it was found that their DL was improved. The findings refute "Seashore's bourgeois theory" that pitch discrimination is based on inherited abilities and cannot be improved.—A. Cuk.

4711. Salzinger, Suzanne; Salzinger, Kurt; Portnoy, Stephanie; Eckman, Judith; Bacon, Pauline M., Deutsch, Martin, & Zubin, Joseph. (Biometrics Research, 722 W. 168 St., NYC) **Operant conditioning of continuous speech in young children.** *Child Developm.*, 1962, 33(3), 683-695.—"The spontaneous continuous speech of children ranging in age from 5 to 7 years was reinforced under various experimental conditions. The reinforcing apparatus consisted of a papier-mache clown's head, the nose of which was a red light bulb. . . . The occurrence of the reinforcing light was made contingent upon different aspects of the children's speech in each experiment. It was found that speech rate increased as a result of the administration of reinforcement and decreased or stabilized when reinforcement was withheld. Both the number of reinforcements delivered and the schedule appeared to produce differences in response strength."—W. J. Meyer.

4712. Weir, Morton W. (U. Illinois) **Effects of age and instructions on children's probability learning.** *Child Developm.*, 1962, 33(3), 729-735.—"A three choice probability task was employed in which one of the three choices was reinforced 50 per cent of the times it was chosen and the other two were never reinforced. Children at two age levels (5 to 7 years and 9 to 13 years) served as Ss. One third of the Ss at each age level were instructed that it was possible to be correct on every trial, one third were told that it was not possible to be correct on every trial, and one third were given neutral instructions. Results indicated that the younger Ss chose the reinforcing knob more often than did the older Ss, while the instructional conditions did not influence the number of choices of the reinforcing knob. Analysis of the number of pattern responses revealed an age \times instructions interaction."—W. J. Meyer.

Abilities

4713. Beilin, Harry, & Franklin, Irene C. (Brooklyn, N. Y.) **Logical operations in area and length measurement: Age and training effects.** *Child Developm.*, 1962, 33(3), 607-618.—Piaget, Inhelder, and Szeminska's characterization of the development of length and area measurement was tested with 1st and 3rd grade children. A deliberate attempt to influence measurement concept acquisition by instruction was also tested in a transfer of training experiment. It was found that length measurement is achieved prior to area measurement, contrary to the Piaget et al. description. For the 1st and 3rd graders the achievement of measurement is affected by the test itself, and 3rd graders are influenced further by instruction in measurement concepts. Piaget's de-

velopmental theory is given support by the evidence that no 1st grader achieves operational area measurement even with training and instruction.—*Author abstract.*

4714. Chandra, Rukmani Ram. (Government Teachers Coll., Ajmer, India) **A study in children's vocabulary.** *U. Rajasthan Stud. (Educ.)*, 1960, 4, 1-20.—Spoken vocabulary of children of 7+ and 8+ was surveyed through observation of 30 children. 65 words having 75-100 percentage of child frequency were listed. 3 other preference lists were prepared. The vocabulary contained 63% nouns, 2% pronouns, 20% verbs, and 9% adjectives. The vocabulary of a nationalized textbook was also analyzed, revealing 52% nouns, 3% pronouns, 13% adjectives, and 18% verbs. Various suggestions for improving textbooks are offered.—U. Pareek.

4715. Dockrell, W. B. (U. Alberta) **The relationship between socio-economic status, intelligence and attainment in some Scottish primary schools.** *Indian psychol. Bull.*, 1959, 4, 1-6.—A test of the hypothesis that the correlation between socio-economic status and intelligence can wholly or partly be explained by differences in acquired skills. The Ss were children completing primary school in a Scottish city in 1957. Scores on the Moray House English test provided an English Quotient (EQ); on an arithmetic test, an Arithmetic Quotient (AQ); and on an intelligence test, an Intelligence Quotient (IQ). The mean social ratings made in school provided an index of Socio-Economic Status (SES). In a factor analysis of the data, the 1st orthogonal rotation of the loadings showed the groupings of SES and EQ. A 2nd orthogonal rotation yielded a larger common factor and a separate grouping of the 3 tests (intelligence, English, and arithmetic). Partial correlation coefficients were computed as follows: SES and IQ = .49, $p = .01$; SES and EQ = .62, $p = .01$; SES and AQ = .52, $p = .01$; IQ and AQ = .82, $p = .01$; EQ and AQ = .90, $p = .01$; other partial correlations were not significant.—A. K. Ganguly.

4716. Elkind, David, & Scott, Lee. (U. California Los Angeles School Medicine) **Studies in perceptual development: I. The decentering of perception.** *Child Developm.*, 1962, 33(3), 619-630.—126 nursery and elementary school children were tested with a set of 7 ambiguous pictures. Results showed that success in perceiving ambiguous pictures increased significantly with age, with the articulation of the pictures, and with IQ. Controls for test-content familiarity, test attitude, order of presentation, and sex were included in the study. The results were discussed in relation to the developmental theory of Piaget and the satiation theory of Kohler and Wallach. It was concluded that the Piaget theory gave the most consistent and economical account of the obtained results.—*Author abstract.*

4717. Hindley, C. B. (U. London) **Social class influences on the development of ability in the first five years.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 29-41.—170 children in greater London are being studied. Data on 80 cases are presented. IQs in upper classes seem to rise, middle class to remain constant,

and lower classes to fall. In addition, sphincter control and absence of sibling are associated with rising curves.—*B. T. Jensen.*

4718. Katsui, A. (Shizuoka U.) [A developmental study on the perception of direction in two-dimensional space.] *Jap. J. Psychol.*, 1962, 33(2), 63-70.—This study analyzed the ability of children to perceive spatial direction by presenting Ss with a standard figure tachistoscopically and then presenting him with a set of comparison figures, varying in their spatial orientation, from which to choose the same figure as the standard figure. It was found that frequency of errors was highest in a diagonal, less in a horizontal, and least in a vertical direction. Errors of the mirror type, i.e., reversal of right and left were most frequent, with reversal errors next, and errors of 45° rotation least frequent. It was suggested that the high frequency of right-left reversals may indicate that concepts of right-left are not well established in the 3-8-year-old group.—*A. Barclay.*

4719. Lovell, K. (U. Leeds) **Jean Piaget's views on conservation of quantity.** *Indian psychol. Bull.*, 1959, 4, 16-19.—An investigation carried out on 326 children of 7-11 in a junior school of a town in northern England to verify 3 successive stages in the development of children's concept of quantity. The general conclusion is that the 3 stages indicated by Piaget are there, but it is suggested that Piaget is wrong in making the operation of reversibility and/or the multiplication of relations the decisive issues. Reversibility and a consideration of dimensions may produce conservation in some children but they do not in others—some children attain conservation on other grounds. It appears that conservation arises out of the interlocking of several schemata and that we must look for a group of operations, not just the 2 proposed by Piaget.—*A. K. Ganguly & K. Ray-Chowdury.*

4720. Sutherland, M. B. (Queen's U., Belfast, Ireland) **A note on pre-sleep imagining in 10-year-old children.** *J. child Psychol. Psychiat.*, 1962, 3(2), 111-114.—A questionnaire was administered to 123 girls and 111 boys. About ½ of both sexes claimed they sometimes made up stories for themselves before falling asleep. A positive relationship between presleep imagining and teachers' estimates of imaginativeness and ability in dramatization was found with girls but not with boys.—*J. M. Reisman.*

4721. Tsimmerman, A. N. (Inst. Evolutionary Physiology, USSR Acad. Sciences) **K kharakteristike oboniatelnogo analizatora u detei doshkol'nogo vozrasta.** [Characteristics of the olfactory analyzer in preschool children.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 236-243.—Positive and negative CR to odors (anise, lemon, rosewood, pine tree) were established in children (age 4-7) using the method and the apparatus devised by Ivanov-Smolenskii. The first CR was hard to form but the elaboration of the following CR, both positive and negative, was easy. Although the olfactory analyzer is already fully developed at this age, the difficulty of elaborating the first CR is due to the fact that in Ss of this age connection between olfactory stimuli and motor response is uncommon and unusual.—*A. Cuk.*

4722. Curpillot, Eliane. **Détails caractéristiques et reconnaissance de formes familiaires.** [Characteristic details and recognition of familiar forms.]

Psychol. Franc., 1962, 7(2), 147-155.—A genetic study of the elemental aspects of perceptual syncretism was made on 75 children aged 4-11 years, using altered drawings of rabbits and sheep. The Ss were instructed to classify each drawing. The results indicated an increasing differentiation with age and a greater importance for some details than for others.—*C. J. Adkins.*

4723. Włodarski, Z. **Niektóre właściwości pamięci bezpośredniej i odroczonej u dzieci.** [Certain properties of immediate and delayed recall in children.] *Psychol. Wych.*, 1962, 5(1), 32-41.—The span of direct memory for school age children increased from 4 to 7 words. Nouns were reproduced easier than verbs and adjectives. The recognition of particular traits or activities of persons was difficult for preschool children. The ability to differentiate certain aspects of geometric figures was weak for most children.—*H. Kaczowski.*

Personality

4724. Bandura, Albert; Ross, Dorothea, & Ross, Sheila A. (Stanford U.) **Imitation of film-mediated aggressive models.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 3-11.—In a test of the hypothesis that exposure of children to film-mediated aggressive models would increase the probability of Ss' aggression to subsequent frustration, 1 group of experimental Ss observed real-life aggressive models, a 2nd observed these same models portraying aggression on film, while a 3rd group viewed a film depicting an aggressive cartoon character. Following the exposure treatment, Ss were mildly frustrated and tested for the amount of imitative and nonimitative aggression in a different experimental setting. The overall results provide evidence for both the facilitating and the modeling influence of film-mediated aggressive stimulation. In addition, the findings reveal that the effects of such exposure are to some extent a function of the sex of the model, sex of the child, and the reality cues of the model. (24 ref.)—*Journal abstract.*

4725. Boehm, Leonore. (Brooklyn Coll.) **The development of conscience: A comparison of American children of different mental and socioeconomic levels.** *Child Developm.*, 1962, 33(3), 575-590.—In a study of some aspects of conscience development in public schools (2 Catholic parochial schools and 1 Jewish parochial school), academically gifted children were compared with children of average intelligence, and upper middle-class children with children of the working class. Academically gifted children and upper middle-class children mature earlier in their moral judgments concerning distinctions between intention and outcome of an action. There is a greater difference between responses of the gifted and average children of the upper middle-class.—*W. J. Meyer.*

4726. Boehm, Leonore. (Brooklyn Coll.) **The development of conscience: A comparison of students in Catholic parochial schools and in public schools.** *Child Developm.*, 1962, 33(3), 591-602.—In terms of distinguishing between intent and results of an action, Catholic parochial school children, regardless of socioeconomic status or intelligence level, scored higher and at an earlier age than public school children. Academically gifted upper middle-class

children were similarly superior to children of average intellectual ability from the working classes. In terms of independence from adults, there was a tendency for middle-class children and for academically gifted upper middle-class children to score higher than their counterparts.—*W. J. Meyer.*

4727. Boehm, Leonore, & Naas, Martin L. (Brooklyn Coll.) Social class differences in conscience development. *Child Developm.*, 1962, 33(3), 565-574.—160 children from working class and upper middle class backgrounds were interviewed using Piaget's clinical method. 4 stories, designed to measure attitudes toward physical aggression, material values, lying, and integration of authority and authority dependence, were told each child. The stories did not differentiate between the social class levels. Girls were not superior to boys in terms of moral evaluations. There was a developmental trend in the direction of more mature moral evaluations with increasing age.—*W. J. Meyer.*

4728. Carrier, N. A., Orton, K. D., & Malpass, L. F. (Southern Illinois U.) Responses of bright, normal, and EMH children to an orally-administered manifest anxiety scale. *J. educ. Psychol.*, 1962, 53(6), 271-274.—Groups of children 10-14 years old differentiated (by WISC IQ) into bright (mean IQ 129), normal (mean IQ 102), noninstitutionalized educable mentally handicapped (EMH) groups (mean IQ 67), and an institutionalized EMH group (mean IQ 67) were given the Children's Manifest Anxiety scale (CMA scale) orally and individually. CMA scale scores generally differentiated the groups, and girls tended to have higher A scale and L scale scores than boys. Tentative evidence of a negative A scale IQ relationship as well as a possible acquiescence set in low-IQ Ss suggests caution in using the CMA scale.—*Journal abstract.*

4729. Cohen, Donald J. (Behavior Research Lab., Waltham, Mass.) Justin and his peers: An experimental analysis of a child's social world. *Child Developm.*, 1962, 33(3), 697-717.—A new instrument for the experimental analysis of social behavior is described. As an example of its usefulness, the performance of a normal 13-year-old is examined as he performs the task with different individuals (sister, close friend, mother, stranger).—*W. J. Meyer.*

4730. Coopersmith, S. (Wesleyan U.) Clinical explorations of self esteem. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 61-78.—5 types of youngsters were identified on basis of self and behavioral ratings, and these were compared with test battery performance. A brief description of each type is given in terms of 5 variables: ability, energy, affect and anxiety, orientation and awareness, and stability.—*B. T. Jensen.*

4731. Gellert, Elizabeth. (Yeshiva U.) The effect of changes in group composition on the behaviour of young children. *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 168-181.—"Fifty-five preschool-age children were observed in paired interaction while playing for a series of 20-minute sessions in a constant setting. The variability of individuals' dominance behaviour during three sessions wherein the partner remained constant, was compared with their variability during two sessions wherein the

identity of the playmate was varied. It was found that varying the identity of the playmate tended to decrease the stability of the test children's dominance behaviour significantly. There was also a significant tendency for individuals to display more dominance when paired with the less assertive of two playmates."—*C. M. Franks.*

4732. Groff, Patrick J. (San Diego State Coll.) Children's attitudes toward reading and their critical reading abilities in four content-type materials. *J. educ. Res.*, 1962, 55(7), 313-317.—This study suggested that the reading comprehension of an individual child is influenced by his attitude toward the content type of material being read. It pointed up the significant differences in attitudes toward reading due to sex characteristics. Attitude toward reading as a school activity has an important enough effect on the other variables of the study to warrant serious consideration.—*F. Goldsmith.*

4733. Heider, G. M. (National Inst. Mental Health) Vulnerabilities, sources of strength, and capacity to cope in the "normal" child. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 79-93.—A description of the approach used in the "Coping Project" in Topeka and some sources of strength and vulnerability therein identified.—*B. T. Jensen.*

Franc.*, 1962, 7(3), 216-222.—Preliminary, quasi-experimental study of a group of 9-14-year-old children at a holiday camp. Hypothesis: If 2 groups with unequal resources were in competition for the same goal, intragroup phenomena (reaction to authority, social atmosphere) would be different for the 2 groups. Results were inconclusive but provocative.—*C. J. Adkins.*

4735. Johnson, Ronald C. (U. Hawaii, Honolulu) Early studies of children's moral judgments. *Child Developm.*, 1962, 33(3), 603-605.—A review of certain studies concerned with the development of moral judgment, published prior to Piaget's analysis, lend support to the more recent formulations.—*W. J. Meyer.*

4736. Larder, Diane L. (U. Washington) Effect of aggressive story content on nonverbal play behavior. *Psychol. Rep.*, 1962, 11(1), 14-15 4-year-old children were reinforced with 2 min. of story reading for pressing either of 2 bars, one resulting in activation of an aggressive toy, the other, a nonaggressive toy. $\frac{1}{2}$ the group, reinforced with aggressive story content, made more aggressive toy responses than the $\frac{1}{2}$ with nonaggressive content.—*B. J. House.*

4737. Levin, Gerald R., & Simmons, John J. (Brown U.) Response to praise by emotionally disturbed boys. *Psychol. Rep.*, 1962, 11(1), 10.—For 15 severely disturbed boys tested in a free-operant, 2-choice marble-dropping task, "praise did not function as a reinforcer for the group as a whole or for a majority of Ss."—*B. J. House.*

4738. Pulver, Urs, & Lang, Alfred. (Burgunderstr. 65, Bern, Switzerland) Von der "Störbarkeit" zur "Schüchternheit" in der Entwicklung

des Kindes: I. Verhaltensweisen der Erstklässler. [From "irritability" to "timidity" in child development: I. Modes of behavior among first graders.] *Schweiz. Z. Psychol. Anwend.*, 1961, 20(4), 329-344.—21 children from the Bernese Longitudinal Study were tested for behavioral signs of timidity at the age of 8 years. The experiment consisted of (a) a short interview and 10 minutes of a shopping game, during which several ratings and measurements of behavior were made and (b) a subsequent interview and a 10 minute continuation of the shopping game conducted by another E, who was not acquainted with the children. The hypothesized measure of timidity failed to differentiate between the children. However, 3 clusters of behavior were identified and one of them was held to represent the "basic attitude toward objects." (English summary)—J. W. House.

4739. Smock, Charles, & Holt, Bess Gene. (Purdue U.) Children's reactions to novelty: An experimental study of "curiosity motivation." *Child Develpm.*, 1962, 33(3), 631-642.—The purpose of this study was to test the hypotheses that environmental events which induce perceptual conflict will evoke behavior that maximizes perceptual contact with these "novel" objects, and that individual variation in perceptual rigidity will be negatively related to curiosity under these conditions. 44 1st-grade children (22 boys and 22 girls) were administered 4 tasks representing different types of perceptual conflict, stimulus ambiguity, stimulus incongruity, absence of stimulus support for conceptual structuring, and relative preference for the unknown, in addition to a measure of rigidity. Results generally supported both hypotheses.—Author abstract.

4740. Witryol, S. L., & Alonzo, Alexander A. (U. Connecticut) Social manipulation of preschool children's paired comparisons incentive preferences. *Psychol. Rep.*, 1962, 10, 615-618.—Scale values were obtained for 5 incentive objects, bubble gum, balloons, charms, marbles, and paper clips, presented by the method of paired comparisons to 20 preschool children instructed to indicate preference. Original preferences were compared with results of a retest during which Ss were informed that the other children preferred paper clips. A significant increase in preference for paper clips on the retest was interpreted as a demonstration of socially determined value.—B. J. House.

Parent-Child Relations

4741. Becker, Wesley C., Peterson, Donald R., Luria, Zella; Shoemaker, Donald J., & Hellmer, Leo A. (U. Illinois) Relations of factors derived from parent-interview ratings to behavior problems of five-year-olds. *Child Develpm.*, 1962, 33(3), 509-535.—On the basis of interviews, the childrearing practices and general attitudes of mothers and fathers of 71 kindergarten children were rated on from 64 to 71 scales. Factor scores were determined for mothers and fathers separately which were related to factors derived from parent and teacher ratings of children. Parent attitudes showed considerable similarity; high parent hostility and use of physical punishment were related to aggression in the child; personality problems in children showed few linear relations to parent behavior.—W. J. Meyer.

4742. Brooks, Edna E., Buri, Jane; Byrne, E. A., & Hudson, M. C. Socioeconomic factors, parental attitudes and school attendance. *Soc. Wks.*, 1962, 7(4), 103-108.—A study of factors affecting school attendance found a significant correlation between parental attitudes towards the school and attendance by the child. No significant relationships were found between school attendance and family income, parental educational level, and other often hypothesized relationships.—G. Elias.

4743. Chorost, Sherwood Bruce. (U. Texas) Parental child-rearing attitudes and their correlates in adolescent hostility. *Genet. Psychol. Monogr.*, 1962, 66(1), 49-90.—Parental attitudes were assessed through an adaptation of the Parent Attitude Research Instrument scales. Adolescent fantasy was measured using a revised scoring system for the Rosenzweig P-F test. Maternal and paternal Authoritarian Control attitudes were positively correlated with overt adolescent hostility ($P < .05$) and Paternal Warmth attitudes tended to be negatively related to overt hostility ($P < .10$). Although the two attitudes factors proved to be orthogonal, the findings did not support the interaction hypotheses implied in Schaefer's two-dimensional model. Rather they supported Sear's identification model.—Author abstract.

4744. Crites, J. O. (U. Iowa) Parental identification in relation to vocational interest development. *J. educ. Psychol.*, 1962, 53(6), 262-270.—The purpose of this study was to derive and test 3 hypotheses about the relationship of parental identification to vocational interest development: (a) degree of identification with the father and mother correlates with vocational interest pattern, (b) kind of identification with the father and mother varies with vocational interest pattern, and (c) pattern of identification is associated with masculinity-femininity of interests. Tests of the hypotheses were made on 3 groups of Ss ($N = 100, 100, 150$). Results from the Semantic Differential and Strong Vocational Interest Blank indicated that a son's identification with both of his parents significantly affects the patterning of his interests, but that his identification with the father is more important. (29 ref.)—Journal abstract.

4745. Geber, Marcelle. (20 Rue de la Source, Paris, France) Développement psycho-moteur des petits Baganda de la naissance à six ans. [Psychomotor development of Baganda children from birth to six years.] *Schweiz. Z. Psychol. Anwend.*, 1961, 20(4), 345-357.—In Uganda, 107 newborn and 303 children from 1 month to 6 years were studied. They represented 3 types of social milieu: traditional, European, and Europeanized. The new-born children were examined by the method of A. Thomas and Saint-Anne Dargassies, between 1 month and 3 years by the Gesell test, and between 3 and 6 years by Terman-Merrill's test combined with the Gesell. There were no notable differences between children from European and Europeanized environments with respect to their psychomotor development. However, the psychomotor development of traditionally reared children initially progressed at a faster rate than their European counterparts and decelerated markedly after the age of 2 years, when abrupt weaning took place. Intensity of mothering, suddenness of weaning, strictness of upbringing, stimulation, and environment are

discussed in relation to psychomotor development. (English summary)—J. W. House.

4746. Glarborg, K. (Ministry for Greenland, Copenhagen, Denmark) **Child-rearing in West Greenland.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 106-120.—Native children today are more impudent and disrespectful; parents are more severe. The author discusses some social and technological changes that seem to be associated.—B. T. Jensen.

4747. Greenbaum, Marvin. (U. Oregon Medical School) **The displaced child syndrome.** *J. child Psychol. Psychiat.*, 1962, 3(2), 93-100.—The displaced child is one who passively experiences frustration engendered by an abrupt diminution in parental nurturance and affiliation. Observations of 23 cases indicate varying symptoms but chiefly irritability, discouragement, clinging to parental figures, and jealousy of younger siblings. Many of the children rapidly improved when their parents were able to reinstitute a closer relationship based on a valuation of the child himself.—J. M. Reisman.

4748. Haber, L. D. (Look Magazine) **Age and integration setting: A re-appraisal of "The Changing American Parent."** *Amer. sociol. Rev.*, 1962, 27(5), 682-689.—"An unforeseen consequence of the method of classification of the entrepreneurial and bureaucratic families in [Miller and Swanson's] *The Changing American Parent* [see 33: 8015] is that it produced differences in the age distributions of the two groups studied. The history of changes in child care advice suggests an alternative and on the whole a more successful explanation of the reported findings. The differences between entrepreneurial and bureaucratic families in child rearing practices presented in the Detroit study are readily predictable from the knowledge that the two groups differ in age, since this implies that the parent socialization of the two groups occurred in different historical climates. While this appraisal does not eliminate the possibility that integration setting may be complementary to the historical variable in parent socialization, the hypothesis presented in the book—that occupational types influence child care practices—must be viewed, at best, as not yet validated."—L. Berkowitz.

4749. Hoffman, Martin L. (Merrill-Palmer Inst.) **The role of the parent in the child's moral growth.** *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 18-33.—The effects of parental influence on child's moral growth are discussed.—S. A. Walters.

4750. Lynn, David B. (Coll. San Mateo) **Sex-role and parental identification.** *Child Developm.*, 1962, 33(3), 555-564.—The nature of the achievement of an appropriate sex-role and the process of parent identification differ for males and females. Thus males tend to identify with a cultural stereotype of the masculine role, whereas females tend to identify with aspects of their own mother's role specifically. An additional hypothesis suggests that in learning the appropriate identification each sex acquires separate methods of learning. An examination of the relevant research supports the theoretical assertions.—W. J. Meyer.

4751. Purcell, Kenneth. (Children's Asthma Research Inst. & Hosp., Denver, Colo.) **A method to**

assess aspects of parent-child relationships. *Child Developm.*, 1962, 33(3), 537-553.—"The present paper reported 3 experiments designed for preliminary evaluation of a research method to assess certain aspects of parent-child relationships. The method involved observing the effect of portrait color photographs of various maternal facial expressions upon S's performance in different experimental situations. Maternal cues appeared to exert a significant influence upon S's behavior in a learning task, a pseudo-ESP test, and a size estimation task."—W. J. Meyer.

4752. Schulman, R. E., Shoemaker, D. J., & Moelis, I. (U. Illinois) **Laboratory measurement of parental behavior.** *J. consult. Psychol.*, 1962, 26(2), 109-114.—41 boys, 8-12 years old, and their parents are observed in a laboratory situation. Parents of conduct problem children were rated as significantly more rejecting and hostile toward the children.—E. R. Oetting.

4753. Shaw, Merville C., & Dutton, Bert E. (Chico State Coll.) **The use of the Parent Attitude Research Inventory with the parents of bright academic underachievers.** *J. educ. Psychol.*, 1962, 53(5), 203-208.—Responses to the Parent Attitude Research Inventory of parents of bright 10th- and 11th-grade academic achievers were compared to the responses of parents of bright academic underachievers. The responses of mothers and fathers (a total of 151 participants) were considered separately and in accordance with the sex of the child. Parents of underachievers had significantly stronger negative attitudes toward their underachieving child. Particularly pronounced was a trend toward Suppression of Sexuality among parents of underachievers.—*Journal abstract.*

4754. Skard, A. G. (U. Oslo) **Longitudinal observations of changing family relations.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 13-18.—"... parents as human beings change with age and are changed by the circumstances that life gives them." Reference is made to changes in sibling as well as parent attitudes.—B. T. Jensen.

4755. Stott, D. H. (Glasgow U.) **Abnormal mothering as a cause of mental subnormality: I. A critique of some classic studies of maternal deprivation in the light of possible congenital factors.** *J. child Psychol. Psychiat.*, 1962, 3(2), 79-91.—A neglected factor in these studies is stress experienced by the mother during pregnancy which research indicates might lead to physical illnesses and defects and personality impairments in offspring. It is hypothesized that the institutionalized child is often the victim of congenital damage due to his mother's unhappy and/or unhealthy pregnancy and that this variable, rather than maternal deprivation, is crucial.—J. M. Reisman.

4756. Zurich, M. (Texas Woman's U.) **The relation between parental attitudes toward child rearing and child behavior.** *J. consult. Psychol.*, 1962, 26(2), 197.—Relationship between the Parental Attitude Research Instrument given to parents and a time sampling of child behavior are significant only in a percentage attributable to chance.—E. R. Oetting.

ADOLESCENCE

4757. Bergler, Reinhold. (Nuremberg) *Die psychologische Struktur der Leitbilder jugendlicher*. [Psychological structure of life-goals in adolescence.] *Vita hum.*, Basel, 1962, 5(1), 34-60.—This study compares the life-goals of a group of adolescents with those of a representative sample of adult West Germans by means of projective interviews. It was found that the adolescents tend unconsciously to subscribe to the behavior pattern approved and structured by the adult world. At the same time they tend to feel consciously isolated from the adult community. The results are discussed in terms of a theory of life-goals.—J. L. Yager.
4758. Bronfenbrenner, Urie. (Cornell U.) *Soviet methods of character education: Some implications for research*. *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 45-61.—The influence of the peer group upon character development of youth in Soviet Russia is discussed.—S. A. Walters.
4759. Clarke, H. Harrison, & Degutis, Ernest W. (U. Oregon) *Comparison of skeletal age and various physical and motor factors with the pubescent development of 10, 13, and 16 year old boys*. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 356-368.—The findings of this study indicated that physical maturation was differentiated most effectively at 13 years of age, although it was not so sensitive to maturational changes as was skeletal age; at 16 years, maturational differentiation was much more limited; and at 10 years, little or no value can be attributed to this method. The 13- and 16-year-old boys who were advanced in pubescent development had higher mean scores on all physical and motor tests studied with few exceptions; generally, the differences between the means were significant. In terms of physique types, the only significant difference was found at 16 years of age, where a greater percentage of ectomorphs was found in pubescent Group 4 than in Group 5.—*Journal abstract*.
4760. Goppert, H. (Psychiatrische Nervenklinik, U. Freiburg, Germany) *Sexual krisen bei Jugendlichen*. [Sexual crises in adolescents.] *Z. Psychother. med. Psychol.*, 1962, 12(3), 112-122.—Masturbation and exhibitionism in adolescents are viewed from the frame of reference of an extended concept of the "Freudian libido." Sexual crises in adolescents basically represent disturbances in this process of maturation which could be termed "becoming."—I. Neufeld.
4761. Graubard, Stephen R. (Ed.) *Youth: Change and challenge*. *Daedalus*, 1962, 91(1), 1-239.—This is a collection of papers on the nature of youth, the problems of identity and development encountered by youth, and on the similarities and differences in the cultural patterning of the opportunities and problems of youth. Papers are included by Bruno Bettelheim, Reuel Denney, S. N. Eisenstadt, Erik H. Erikson, Kenneth Keniston, Robert J. Lifton, Kasper D. Naegele, Talcott Parsons, George Sherman, and Laurence Wylie.—K. E. Davis.
4762. Havighurst, Robert J., Bowman, Paul H., Liddle, Gordon P., Matthews, Charles V., & Pierce, James V. *Growing up in River City*. New York: Wiley, 1962. xiii, 189 p. \$4.50.—This, the 1st of a series, describes a longitudinal study carried on from 1951 to 1960 with an initial group of 6th graders in a midwestern community of 45,000. Through the present report is concerned primarily with the control group, it describes in detail how boys and girls grow up in a "typical" community. The main emphasis is on how the family, the school, and the community organize their entire resources to provide these youth with the best possible chance to grow into adequate adults regardless of abilities and social-class backgrounds.—H. Angelino.
4763. Kennedy, W. A., Turner, A. J., & Lindner, R. (Florida State U.) *Effectiveness of praise and blame as a function of intelligence*. *Percept. mot. Skills*, 1962, 15(1), 143-149.—High school students were tested on a visual discrimination task. It was found that for intellectually average or slightly above high school children, blame has a somewhat variable but generally strong inhibiting effect on performance. At the upper end of the intelligence scale this does not hold and there is no difference between the effects of praise and blame.—W. H. Guertin.
4764. Lesser, Gerald S., Krawitz, Rhoda N., & Packard, Rita. (Hunter Coll.) *Experimental arousal of achievement motivation in adolescent girls*. *J. abnorm. soc. Psychol.*, 1963, 66(1), 59-66.—2 groups of female high school students (40 achievers and 40 underachievers, matched for IQ) were exposed to 2 experimental conditions (Neutral and Achievement Oriented) and 2 types of pictures (those depicting males and those depicting females). The overall effect of the experimental achievement arousal conditions for all girls was nonsignificant. However, a highly significant 2nd-order interaction effect was obtained: the achievement motivation scores of achievers increased significantly in response to Achievement Oriented conditions when they produced stories to pictures of females but did not increase in response to pictures of males; by contrast, the achievement motivation scores of underachievers increased significantly in response to Achievement Oriented conditions when they produced stories to pictures of males but did not increase in response to pictures of females. (43 ref.)—*Journal abstract*.
4765. Livson, N., & McNeill, D. (U. California, Berkeley) *The accuracy of recalled age of menarche*. *Hum. Biol.*, 1962, 34(3), 218-221.—At about age 30 the mean recalled age of menarche of 43 women, whose mean actual age of menarche was 12.8 years, was 12.3 years. Although by t-test the difference was significant ($P < .001$), it is likely that it would have been less had an improved recall procedure been employed.—P. Swarts.
4766. Miller, E. *Individual and social approach to the study of adolescence*. *Brit. J. med. Psychol.*, 1962, 35(3), 211-224.—"Adolescence as we have noted repeatedly is a process of socialization parallel with the acquisition of ego-identity, and therapy must have its roots in individual psychopathology and in social dynamics." There are special issues in the treatment of the adolescent having to do with the training, age, and sex of the therapist. Often, group therapy is especially useful.—C. L. Winder.
4767. Remmers, H. H. (Purdue U.) *Cross-cultural studies of teenagers' problems*. *J. educ. Psychol.*, 1962, 53(6), 254-261.—This paper reports findings from representative stratified samples of more than 5000 teenagers in school in the United States,

Puerto Rico, West Germany, and India who responded to the Science Research Associates Youth Inventory, a problem check list adapted to each of the cultures surveyed. Mean scores, reliability estimates, intercorrelations of subscale scores, and factor analyses of these matrices all lead to the conclusion that (a) the measuring instrument is highly reliable, (b) teenagers' self-perceived problems can be comparably measured across widely different cultures, (c) rankings of problem areas across cultures are highly similar, (d) health problems are of least concern and post-highschool problems of most concern. The amount and intensity of worry varies greatly across cultures.—*Journal abstract.*

4768. Tanner, J. M., & O'Keeffe, B. (U. London, England) Age at menarche in Nigerian school girls, with a note on their heights and weights from age 12 to 19. *Hum. Biol.*, 1962, 34(3), 187-196.—The mean menarcheal age of high economic status Ibo girls attending 3 Roman Catholic residential secondary schools in Eastern Nigeria was 14.1 years. For 95% of the girls menarche was experienced within the age range 11.2-17.0 years.—P. Swartz.

4769. Vernon, P. E. (U. London) Intelligence and intellectual stimulation during adolescence. *Indian psychol. Bull.*, 1957, 2, 1-6.—The present article reports briefly 3 investigations in which, not quantity, but quality of schooling during adolescence was shown to influence intellectual development. The general implications of these studies are that we should cease to classify the abilities of adolescents and young adults under the simple headings of attainments (affected by schooling) and "g" or intelligence (dependent purely on maturation or innate factors). Certain aspects of intelligence, in particular flexibility of thinking, are as much, or more, affected by the stimulation that different environments and different types of schooling provide as are the conventional attainments.—A. K. Ganguly & K. Ray-Chowdhury.

4770. Withey, Stephen B. (U. Michigan) The influence of the peer group on the values of youth. *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 34-44.—Peer group impact upon values of American youth is discussed.—S. A. Walters.

MATURITY & OLD AGE

4771. Anderson, J. E., Jr. (Florida State U.) Aging and educational television: A preliminary survey. *J. Gerontol.*, 1962, 17, 447-449.—". . . it is possible to state with some certainty that there is an audience for special interest programs designed to reach the senior citizen and that educational television is a medium whereby these citizens can be made accessible."—J. Botwinick.

4772. Birren, J. E., & Speith, W. (National Inst. Mental Health) Age, response speed, and cardiovascular functions. *J. Gerontol.*, 1962, 17, 390-391.—33 psychological and physiological measures were made on 161 male Ss between the ages of 23 and 60 years. The correlational matrix and factor analysis of these variables indicated higher relations between age and psychological measures than between age and physiological measures. Cardiovascular functions were not correlated with cognitive and psychomotor functions.—J. Botwinick.

4773. Davis, R. W. (Portland U.) The relationship of social preferability to self-concept in an aged population. *J. Gerontol.*, 1962, 17, 431-436.—The factors Self-concept, Personal Adjustment, and Social Functioning were investigated in a sample of 33 ambulatory residents of a home who ranged in age from 70 to 96 yrs. A relationship was found between self-estimates and effectiveness in social interaction.—J. Botwinick.

4774. Dean, Lois R. (Portland State Coll.) Aging and the decline of affect. *J. Gerontol.*, 1962, 17, 440-446.—4 affective states (anger, irritation, boredom, and loneliness) as they change with age were investigated by questionnaire. Loneliness increases in later life and the other 3 states decrease.—J. Botwinick.

4775. Gilbert, Jeanne G., & Hall, M. R. (Mt. Carmel Guild Guidance Inst., Newark, N. J.) Changes with age in human figure drawing. *J. Gerontol.*, 1962, 17, 397-404.—Quantitative and qualitative changes in the human figure drawings of 400 normal persons between the age of 10 and 91 years and 210 hospitalized schizophrenic patients between ages 20 and 50 years were described.—J. Botwinick.

4776. Hodgkins, Jean. (California U.) Influence of age on the speed of reaction and movement in females. *J. Gerontol.*, 1962, 17, 385-389.—RTs and movement times were measured of 480 female Ss ranging in age from 6 to 84 years. RTs improved from childhood to 19 years, remained constant to 26 years, and slowed with age thereafter. RT and movement time were "uncorrelated in all age level groups studied, with one exception, that of the group between the ages of 23-37."—J. Botwinick.

4777. Jeffers, Frances C., Eisdorfer, C., & Busse, E. W. (Duke U.) Measurement of age identification: A methodologic note. *J. Gerontol.*, 1962, 17, 437-439.—Self-age category placement by Ss in the present study was compared to that by Ss in a standardized inventory of activities and attitudes. Differences were found.—J. Botwinick.

4778. Johnson, L., & Strother, G. B. (Washington State Coll.) Job expectations and retirement planning. *J. Gerontol.*, 1962, 17, 418-423.—Several hypotheses regarding relations between attitudes towards retirement and attitudes and experiences of job were examined by a structured interview and attitude checklists. The results were discussed in the context of the hypotheses and in relation to differences between age groups.—J. Botwinick.

4779. Pollack, M., Karp, E., Kahn, R. L., & Goldfarb, A. I. (Dept. Mental Hygiene, Queens Village, N. Y.) Perception of self in institutionalized aged subjects: I. Response patterns to mirror reflection. *J. Gerontol.*, 1962, 17, 405-408.—Response to self-mirror reflections was studied in Ss 65 years or older. Data of 696 Ss suggested that the technique of mirror reflection is a useful adjunct to the mental examination of the elderly.—J. Botwinick.

4780. Schaie, K. Warner. (U. Nebraska) A field-theory approach to age changes in cognitive behavior. *Vita hum.*, Basel, 1962, 5(3), 129-141.—"A view of aging in cognitive behavior is offered, which traces the process as a function of developmental changes in the restraint-coping ability of the individual to the widening and constriction of his

life-space. Three principal restraint dimensions were suggested and operations from the study of rigidity-flexibility were offered as possible measures of the individual's ability to cope with the specified restraints. The concepts of differentiation and regression were also examined in the context of a field-theory oriented developmental framework."—J. L. Yager.

4781. Thumin, F. J. (Washington U., St. Louis) **Reminiscence as a function of chronological and mental age.** *J. Gerontol.*, 1962, 17, 392-396.—Reminiscence of a pursuit rotor problem was measured on 234 Ss divided into 5 CA groups. The youngest 3 CA groups were subdivided into 3 MA groups. "Amount of reminiscence increased between late childhood and early adulthood, then decreased through advanced adulthood." The curve of reminiscence in relation to CA "was strikingly similar to that of the mental growth curve."—J. Botwinick.

4782. Weiss, J. M. A., Willis, B. B., Jones, J. M., Schaie, K. W., Robins, A. J., & Fields, G. L. **Predicting the psychiatric problems of older persons: A follow-up study.** *Comprehens. Psychiat.*, 1961, 2 (6), 350-357.—The Psychiatric Evaluation Index (PEI) was administered to a group of psychiatric clinic outpatients 2 years after it had first been given. Patients were also interviewed and scored on social functioning. The PEI is useful as a predictor of future social functioning. This is a pilot study on gathering data for programs of prevention, treatment, and rehabilitation.—D. Prager.

4783. Zborowski, M., & Eyde, Lorraine, D. (Age Cent. New England) **Aging and social participations.** *J. Gerontol.*, 1962, 17, 424-430.—"The 204 men and women who were interviewed with regard to their experiences and attitudes in the area of social participation did not suggest many changes as they grew older."—J. Botwinick.

SOCIAL PSYCHOLOGY

4784. Albou, Paul. **Problèmes actuels de la psychologie économique.** [Real problems of economic psychology.] *Psychol. Franc.*, 1962, 7(3), 190-200.—Outline and discussion of economic psychology as a new branch of social psychology.—C. J. Adkins.

4785. Back, Kurt W. (Duke U.) **Social research as a communications system.** *Soc. Forces*, 1962, 41(1), 61-68.—An illustration of the "logical stability" or systems approach to questionnaire design, interviewing, analysis of data, and theory.—A. R. Howard.

4786. Brim, Orville G., Jr., Glass, David C., Lavin, David E., & Goodman, Norman. **Personality and decision processes: Studies in the social psychology of thinking.** Stanford, Calif.: Stanford Univ. Press, 1962. ix, 336 p. \$8.00.—In a systematic investigation of the processes involved in decision-making, 96 couples in 3 categories (middle class, lower class, and interaction) were given a number of personality tests and the Decision Process Test (DPT). The DPT concerns the actions parents might take in situations involved with masturbation, homework, obedience, and stealing. Part I describes the theory and method, Part II correlates personality and socioeconomic characteristics, Part III analyses

the differences between couples who worked together on the decisions (interaction sample) from those who did not, and Part IV relates formal decision theory to the decisions made by the middle-class couples. (2 appendixes)—E. D. Lawson.

4787. Couch, A. S. (Harvard U.) **The psychological determinants of inter-personal behavior.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 111-127.—The article presents and expands upon the theory that "every act of complex social behavior has multiple determinants that arise from two different realms—the personality system and the surrounding social environment."—B. T. Jensen.

4788. Fink, Joseph. (Systems Development Corp., Santa Monica) **Life in a missile community.** *J. soc. Issues*, 1961, 17(2), 29-35.—An overview of the impact of space on the social, economic, and educational institutions of communities involved with space agencies and their associated technological support systems. In general, such impact has been negligible and public acceptance is matter of fact.—A. Barclay.

4789. Goodwin, L. **The historical-philosophical basis for uniting social science with social problem-solving.** *Phil. Sci.*, 1962, 29(4), 377-392.—Although "these are powerful arguments for considering the social scientific endeavor as fundamentally separate from social problem-solving," the reflexive impact of the knowledge of social science requires that we adopt an experimental attitude toward social problems. "The uniting of certain aspects of Galilean-Newtonian and Hegelian-Marxian thought provides a genuinely experimental social science in which abstract hypothesis testing is united with social action."—M. Turner.

4790. Guetzkow, H. (Northwestern U.) **Undergirding peace strategies through research in social science.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 88-96.—A relatively small amount of basic research in the social sciences has reference to war and peace. This article gives some areas of knowledge in which work is needed and suggests alternative procedures for accelerating social science research.—B. T. Jensen.

4791. La Barre, Weston. (Duke U.) **They shall take up serpents: Psychology of the southern snake-handling cult.** Minneapolis, Minn.: Univ. Minnesota Press, 1962. 208 p. \$3.75.—The snake-handling cult is spontaneous and unstructured like the holy rollers. Faith healing; speaking in tongues; and by the elect, the handling of copperheads and rattlesnakes along with dancing and singing, give the people an emotional outlet. The snake as a phallic symbol has its counterpart in Egyptian, African, and Hebrew culture; circumcision symbolizes shedding of the snake's skin. "The joyfully guilty masturbatory handling of the phallic snake takes place freely in a cult asserting the power of mind over matter, and the same onanism is induced in his female communicants." The cult has been outlawed in most states since the death of several of its adherents from snake bites, but in leading people with meager and joyless lives through punitive cultural fictions, the

leader may be rendering a therapeutic service.—G. K. Morlan.

4792. Lewis, Lionel S., & Lopreato, J. (U. Nevada) **Arationality, ignorance, and perceived danger in medical practices.** *Amer. sociol. Rev.*, 1962, 27 (4), 508-514.—“The paper validates the hypothesis that arationality [the use of or belief in theologically accepted or magico-religious practices, or use of ineffective health foods, herbs, etc.] in the prevention or treatment of an illness stands in direct relation to perceived danger inherent in that illness, and in inverse relation to medical knowledge about it. . . . The supporting data are drawn from interviews with 104 mothers of children who have suffered one of four illnesses differing in various respects. Arationality is a likely function of stress, but rationality in turn seems to be a functional alternative to arationality. The conclusion is drawn that there is a trend in human society towards greater rationality. Various factors militating against this probability are recognized.”—L. Berkowitz.

4793. Mack, Raymond W., & Baker, George W. (Northwestern U.) **The occasion instant: The structure of social responses to unanticipated air raid warnings.** Washington, D. C.: National Academy of Sciences-National Research Council, 1961. (NAS-NRC Publ. No. 945, Disaster Study No. 15) xv, 69 p. \$2.00.—Data analyzed in this report are from 3 studies of responses to unanticipated air raid warnings in Oakland, California, in 1955; Washington, D. C., in 1958; and Chicago, Illinois, in 1959. There is an effort to ferret out similarities of response and to propose hypothetical generalizations. Questions are posed for future research, and implications are stated for civil defense agencies. “Regrettably, all the studies to date indicate that people seldom instantly adopt an adequate course of protective action after they have a disaster warning. However, since patterned human behavior is socially learned, we believe that dysfunctional post-warning behavior can be significantly modified and improved.”—R. Lawner.

4794. Martin, Edward A. **Psychology of funeral service.** (4th ed.) Grand Junction, Colo.: Sentinel, 1962. xv, 286 p.—Besides presenting in separate chapters the contents of general psychology, topics of particular interest to funeral directors are considered such as grief, sentiment, religion, public relations, and practice and theory of the funeral service.—D. J. Wack.

4795. National Academy of Sciences-National Research Council, Disaster Research Group. **Field studies of disaster behavior: An inventory.** Washington, D. C.: NAS-NRC, 1961. (NAS-NRC Publ. No. 886, Disaster Study No. 14) ix, 78 p. \$2.00.—“This document provides a relatively complete list of the field studies on human behavior in disaster that have been conducted by behavioral scientists.” An inventory of 114 field studies of human behavior in 103 different disaster situations is categorized on the basis of the disaster agents as follows: airplanes; blizzards; earthquakes, volcanic eruptions, and other land movements; epidemics and epidemic threats; explosions and fires; false alerts; floods; hurricanes and typhoons; mine disasters; tornadoes; toxicological substances; World War II bombings; and miscellaneous. Each study is described in terms of the event, date, location, and damage; number of inter-

views, research agency, and principal research personnel; and bibliographic reports and references. In addition, Appendix A presents the same type of analysis of laboratory studies of simulated disaster conditions; Appendix B, of studies of civil defense exercises. An “Index of Research Agencies and Principal Research Personnel” is provided.—R. Lawner.

4796. Osgood, C. T. (U. Illinois) **Toward international behavior appropriate to a nuclear age.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 1. Psychology and international affairs* (see 37: 4116). Pp. 109-132.—After discussing “dynamics of the cold war mentality” and the need to reduce tensions, tension reduction through unilateral action was proposed.—B. T. Jensen.

4797. Pfuetze, Paul E. **Self, society, existence: Human nature and dialogue in the thought of George Herbert Mead and Martin Buber.** New York: Harper, 1961. vi, 400 p. \$2.25.—A paperback edition of a book originally published in 1954.—C. T. Morgan.

4798. Rosenberg, Morris. (National Inst. Mental Health) **Test factor standardization as a method of interpretation.** *Soc. Forces*, 1962, 41 (1), 53-61.—“Interpretation,” the explanation of a relationship between 2 variables by means of an intervening variable (“test factor”), is a major tool in survey research. In some cases when it is a difficult method to employ, one can be aided by resorting to the technique of “standardization.” A simplified procedure for computing standardizations is offered.—A. R. Howard.

4799. Ruitenbeek, Hendrik M. (Ed.) **Psychoanalysis and social science.** New York: Dutton, 1962. xxvii, 226 p. \$1.65 (paper).—12 papers on the relationship between the social sciences and psychoanalysis are presented. Authors included are H. D. Lasswell, T. Parsons, H. Hartmann, G. Roheim, J. R. Seeley, M. Bonaparte, N. Kelman, Erik and Kai Erikson, E. Van Den Haag, and J. Meerloo. There is a selective bibliography at the end of the book for those interested in delving further into this topic.—F. J. Goldstein.

4800. Saul, L. J. **Some psychological bases of war and peace.** *Comprehen. Psychiat.*, 1961, 2(3), 134-139.—Hostility of man against man stems from patterns of disturbed relations during earliest childhood among family members or their substitutes. The preventive task to achieve permanent peace and brotherhood is to see that children are properly reared, especially from conception to years 5, 6, or 7. Religion, science, education, labor, and government must work together if this task is to be less than insuperable.—D. Prager.

4801. Szewczuk, W. **Ideologia, polityka i psychologia.** [Ideology, politics, and psychology.] *Psychol. Wych.*, 1962, 5(2), 121-132.—Because political systems embody philosophical views, particularly on the nature of man, a psychologist cannot escape a definite ideology; consequently, a certain political orientation. Using this premise, the author reviews the work of the 14th International Congress of Applied Psychology. He cites examples why it is utopian to think that psychology can be employed to reduce world tensions.—H. Kaczowski.

CULTURE & CULTURAL RELATIONS

4802. Ainsworth, Leonard H., & Ainsworth, Mary D. (Johns Hopkins U.) **Acculturation in East Africa: I. Political awareness and attitudes towards authority.** *J. soc. Psychol.*, 1962, 57(2), 391-399.—Sentence completion, thematic apperception, and figure-drawing tests were administered to 355 students of 6 secondary schools in Uganda and Kenya selected to represent different levels of acculturation. The more acculturated more frequently than the less acculturated: (a) felt hostile toward authority, (b) were mixed in opinions about authority, (c) were more aware politically and more actively discontent, and (d) were more nationalistic in identification. Degree of acculturation was nonmonotonically related to readiness to identify with Europeans and to a covert tendency to view them as dominant.—*Author abstract.*

4803. Ainsworth, Leonard H., & Ainsworth, Mary D. (Johns Hopkins U.) **Acculturation in East Africa: III. Attitudes toward parents, teachers and education.** *J. soc. Psychol.*, 1962, 57(2), 409-415.—Sentence completion and thematic apperception tests were given to 355 students of 6 secondary schools in Uganda and Kenya selected to represent different levels of acculturation. The more acculturated tended to assign a higher value to education than did the less acculturated, although they were more critical of teachers, as indeed, according to earlier reports, they were more critical of other authority figures. A few differences in attitudes to parents followed the acculturation gradient, others seemed attributable to special acculturation influences associated with sub-cultures, and a few to the influence of the "old" culture.—*Author abstract.*

4804. Ainsworth, Mary D., & Ainsworth, Leonard H. (Johns Hopkins U.) **Acculturation in East Africa: II. Frustration and aggression.** *J. soc. Psychol.*, 1962, 57(2), 401-407.—The Rosenzweig Picture-Frustration, Sentence Completion, and Thematic Apperception tests were given to 355 students of 6 secondary schools in Uganda and Kenya selected to represent different levels of acculturation. In comparison with the less acculturated, the more acculturated: (a) were more frequently frustrated by authority and by the aggression of others, (b) were more frequently aggressive, (c) were more frequently in-punitive and need-persistent, (d) less frequently feared aggression or viewed it and rebellion against authority to be wrong, (e) were less frequently obstacle-dominant, especially extrapunitive obstacle-dominant, and impunitive.—*Author abstract.*

4805. Ainsworth, Mary D., & Ainsworth, Leonard H. (Johns Hopkins U.) **Acculturation in East Africa: IV. Summary and discussion.** *J. soc. Psychol.*, 1962, 57(2), 417-432.—This paper discusses the findings of 3 earlier papers on the effects of acculturation on the personality and attitudes of 355 students of 6 secondary schools in Uganda and Kenya under the following headings: (a) the common characteristics of the total sample, (b) differences attributable to "old" cultures, and (c) differences attributable to special acculturation influences of sub-cultures. Finally (d), the differences attributable to general level of acculturation were formulated in 11 propositions; 6 of these propositions were hypotheses originally guiding the study and supported by its find-

ings, while 5 may be viewed as "new" hypotheses growing out of the data.—*Author abstract.*

4806. Allen, Martin G. (Yale U.) **The development of universal criteria for the measurement of the health of a society.** *J. soc. Psychol.*, 1962, 57(2), 363-382.—Criteria for measuring the health and level of adjustment of a society are formulated through the use of the concept of ego strength. Ego strength refers to the ability to cope with the problems of reality—adequately, directly, realistically. The results of both empirical and theoretical studies which are concerned with healthy, mature, effective functioning are combined, and each variable used in the measurement of ego strength has both empirical and theoretical support. The criteria are presented in terms of both the activities of individuals in the social group and also the factors (values, attitudes, beliefs) underlying the social organization and determining social (and individual) behavior. A rating scale for measuring societies is also presented.—*Author abstract.*

4807. Back, Kurt W., Hill, Reuben, & Stycos, J. Mayone. **Population control in Puerto Rico: The formal and informal framework.** *Law contemp. Probl.*, 1960, 25(3), 558-576.—This paper is divided into 2 parts. The 1st part presents a formal analysis of the relationships between the feasibility of a social act and its conformance to a social norm which is derived from alethic and deontic modal logics. The 2nd part describes the historical development of the population problem in Puerto Rico, including the legal and administrative situation, the current status of birth control practices, and the distribution of attitudes toward and information about birth control as they are related to religious affiliation, educational attainment, and urban-rural background.—*K. E. Davis.*

4808. Cortis, L. E. **A comparative study in the attitudes of Bantu and European workers.** *Psychol. Afr.*, 1962, 9, 148-167.—The results of an interview form used to study Bantu ($N=78$) and European ($N=63$) attitudes are discussed and analyzed. Europeans are more concerned with prestige. The Bantus are more concerned with security, status, and opportunities for advancement. Further, the Bantus are more self-centered and show less group consciousness.—*J. L. Walker.*

4809. Cryns, Arthur G. J. (U. Detroit) **African intelligence: A critical survey of cross cultural intelligence research in Africa south of the Sahara.** *J. soc. Psychol.*, 1962, 57(2), 283-301.—A review of African-White differences in intelligence. Both quantitative and qualitative differences are discussed as well as the interpretation of these differences in terms of the "nature-nurture" issue. A concise review of Negro-white differences in brain morphology precedes the psychological studies. (53 ref.)—*Author abstract.*

4810. Demos, George D. (San Fernando Valley State Coll.) **Attitudes of Mexican-American and Anglo-American groups toward education.** *J. soc. Psychol.*, 1962, 57(2), 249-256.—The study attempted to isolate attitude differences in pupils from Grades 7 through 12. 3 samples of 105 children were selected: Mexican-American; a randomly selected group of Anglo-American; and a group of Anglo-Americans matched with the Mexican-American sample on age,

grade, sex, social class, and intelligence. The method of successive intervals was used in developing the attitude scales. Significant differences of attitude are found among the Mexican-American and Anglo-American groups. In every case where a difference is found between the random samples, the Anglo-American groups have what was judged the more desirable attitude. In the matched sample comparisons, in only one case do the Mexican-American students have what is considered the more desirable attitude. The general agreement between the Mexican-American and Anglo-American Ss is greater than the disagreement. Matching of the Mexican-American and Anglo-American groups does reduce the number of differences of attitude but 6 differences remain significant.—*Author abstract.*

4811. DeRidder, J. C. *The personality of the urban African in South Africa: A Thematic Apperception Test study.* New York: Humanities, 1961. 180 p. \$4.00.—The personality functions of 2500 literate, male, Negro Johannesburgers are illustrated by sample extracts of test responses on the African TAT. Relationships between personality characteristics and cultural influences are analysed in detail, and recurrent themes are identified. A personality analysis of the African nationalist is delineated.—*C. W. Page.*

4812. Derossi Zaccone, F. *Valori culturali e sviluppo delle motivazioni: Il "need for achievement" e il "need for affiliation" in uno studio su 281 soggetti.* [Cultural values and development of motivations: The need for achievement and need for affiliation in a study of 281 subjects.] *Riv. Psicol. soc.*, 1962, 29(1), 101-11.—A comparison of cultural norms of need for achievement and need for affiliation for United States, Italy, Turkey, and Poland.—*L. L'Abate.*

4813. Faverge, J. M., & Falmagne, J. C. *On the interpretation of data in intercultural psychology.* *Psychol. Afr.*, 1962, 9, 22-36.—Research concerning the African (an educated "black") has been difficult. Simon Biesheuval has been a pioneer and leader. Schooling and familiarity with the European way of thinking greatly influence African test scores. (25 ref.)—*J. L. Walker.*

4814. Fuster, J. M. (St. Xavier's Coll., Bombay, India) *A study of the Edwards Personal Preference Schedule on Indian college students.* *J. soc. Psychol.*, 1962, 57(2), 309-314.—Edwards' normative population and a sample of 288 male and female Indian students of St. Xavier's College, Bombay, were compared on the EPPS. The masculinity and femininity patterns of Indian students coincide largely with the corresponding American patterns, but highly significant differences were found in the relative strength of the 15 personality tendencies.—*Author abstract.*

4815. Garrett, H. E. (Columbia U.) *Garrett's reply.* *Eugen. Quart.*, 1962, 9(3), 163-165.—In replying to Wallace (see 37: 4829) the author states that ideological pressures have harassed scientists during the last 30 years.—*S. G. Vandenberg.*

4816. Holleman, J. F., Mann, J. W., & Van den Bergh, Pierre L. (U. Natal) *A Rhodesian white minority under threat.* *J. soc. Psychol.*, 1962, 57(2), 315-338.—This study of a sample of white high-

school students on the Copperbelt took the form of an essay contest followed up by a questionnaire. The major aim was to assess attitudinal reaction to the drastic changes (Congo independence and abolition of the color bar in Northern Rhodesia) that took place between the 2 phases of the study. The main dimensions were racial attitudes, expectation and acceptance of change, and prospects of permanent settlement in Rhodesia. While African advancement was rejected to a greater extent than it was accepted, and while our Ss exhibited traditional white conservatism and anti-African prejudices, there was nevertheless a willingness to adapt to new conditions in order to remain in Rhodesia.—*Author abstract.*

4817. Jacobs, Norman. (Ed.) *Mass culture and mass media.* *Daedalus*, 1960, 89(2), 271-431.—A distinguished group of artists, historians, literary critics, sociologists, and social philosophers attempt to define mass culture, to determine whether or not our contemporary culture is a mass culture, and to assess the effects of the mass media upon our culture and particularly upon the functioning of creative artists.—*K. E. Davis.*

4818. Jahoda, Gustav. (U. Glasgow) *Traditional healers and other institutions concerned with mental illness in Ghana.* *Int. J. soc. Psychiat.*, 1961, 7(4), 245-268.—"Leighton may or may not be right when he claims that rapid acculturation results in an increase of mental illness; as far as Ghana is concerned he is definitely wrong in his view that natural counsellors (wise men, religious leaders, professional healers, etc.) are no longer able to exert their beneficent activity." The outstanding finding in this Ghana study was its demonstration of how extensively traditional institutions have adapted themselves to cope with new needs, and also how new institutions have sprung up for serving such needs. The lesson from this study is that any attempt at enlightenment ought to be cautious in condemning traditional healers and similar institutions, because they perform an extremely important function.—*R. M. Frumkin.*

4819. Katz, F. M. (U. New England, Australia) *A cross-cultural study of adolescent aspirations.* *J. soc. Psychol.*, 1962, 57(2), 277-281.—Using answers to several questions, designed to ascertain the vocational expectations of adolescent boys, an "index of orientation" was constructed. A comparison of the English and Australian samples on this shows that the majority of both samples indicate no expectation of changing their occupational status throughout their working life. A significantly larger proportion of Australian boys expect to achieve occupational mobility. It is suggested that this reflects a difference in the cultural frame of aspirational reference.—*Author abstract.*

4820. Klinger, M. Robert B. *Moral values across cultures.* *Personnel Guid. J.*, 1962, 41(2), 139-143.—Through a questionnaire based on the Scale of Student Behavior by Mueller, suggestions are offered to foreign student counselors to help them distinguish between foreign student groups and American students as to expressed moral values and to clarify the structures and dimensions, organizing expressed values into larger entities. Results based on American graduate Protestants, Arab Moslems, Chinese non-Christians, Indian Hindus, South American Roman

Catholics, Turkish Moslems, and American pre-freshmen Protestants are presented.—S. Kavruck.

4821. Landy, David. (U. Pittsburgh) **Man's adaptive processes: Cultural influences on behavioral change.** *Correct. Psychiat. J. soc. Ther.*, 1962, 8(2), 83-89.—Focuses attention on changing culture patterns resulting from environmental changes and pressures. It is noted that group integrity requires mechanisms of social control which are related to mechanisms for behavioral change.—L. R. Witt.

4822. Mundy-Castle, A. C., & Nelson, G. K. **A neuropsychological study of the Knysna forest workers.** *Psychol. Afr.*, 1962, 9, 240-272.—A neuropsychological test battery was administered to 80 white forest workers who lived in isolated communities. They performed poorly on tests of mental ability and showed a high incidence of EEG abnormalities. (51 ref.)—J. L. Walker.

4823. Murray, Henry A. (Ed.) (Harvard U.) **Myth and mythmaking.** *Daedalus*, 1959, 88(2), 211-380.—The entire issue is devoted to a collection of 11 papers by psychologists, anthropologists, literary critics, and folklorists who attempt to define "myth," to explore the implications of different definitions, and to raise questions concerning the existence and value of myths in the contemporary world. The papers likely to be of most interest to psychologists are H. A. Murray's introduction, C. Kluckhohn's "Recurrent Themes in Myths and Mythmaking," and J. S. Bruner's "Myth and Identity."—K. E. Davis.

4824. Ponzo, E. **Osservazioni in margine ad una spedizione italiana fra gli Indios Piaroa.** [Marginal observations of the Italian expedition to the Piaroa Indians.] *Riv. Psicol. soc.*, 1962, 29(1), 43-53.—Cultural, familial, and personality characteristics of Piaroa Indians were derived from observations and from their graphic expressions.—L. L'Abate.

4825. Ray-Chowdhury, K. (Muslim U., Aligarh, India) **Psychology and Gandhi's non-violent non-cooperation.** *Indian psychol. Bull.*, 1956, 1, 3-8. The statement that "frustration without aggression is a lost personality" is not applicable to Gandhi's case. The noncooperation of psychotics and of normals must be distinguished. It is suggested that failure to do so may be due to a neglect of Kropotkin's "mutual aid" principle and to an overemphasis on Darwin's approaches to the problem.—C. T. Morgan.

4826. Ray-Chowdhury, K. (Muslim U., Aligarh, India) **Allport-Vernon Study of Values (Old Form) in Indian situation: I. Religious group differences in values.** *Indian psychol. Bull.*, 1958, 3, 55-67.—2 groups of college women at Aligarh, one of Hindus (N=23) and the other of Muslims (N=57) were given an experimental version of the Allport-Vernon-Lindzey Study of Values (1951 edition). Statistical analysis indicated that (a) a significant difference exists between the groups in social, political, and religious values; (b) Muslim women showed greater interest in religious values whereas the Hindu women showed greater interest in social and political values. The sociocultural patterns of the highly cultured Hindus are much closer to the Anglo-Americans than those of the Muslims.—A. K. Ganguly & S. L. Mishra.

4827. Rosen, B. C. (U. Nebraska) **Socialization and achievement motivation in Brazil.** *Amer. sociol. Rev.*, 1962, 27(5), 612-624.—"This study examined the relationship of family structure to socialization and achievement motivation in Brazil. A Thematic Apperception Test was used to measure achievement motivation in boys; observation, interviews and questionnaires were employed to obtain data on family structure, child-rearing practices and the boy's perception of his parents. The Brazilian data were compared with those obtained from a criterion group of American boys and their mothers, matched by age and social class. The data revealed that Brazilian mothers were less likely to train their sons in self-reliance, autonomy, and achievement than were American mothers. This de-emphasis on independence and achievement was associated with a common type of family structure in Brazil—the authoritarian, father-dominated family. The indulgence, over-protectiveness, and authoritarianism which boys experience in this type of family were regarded as significant factors responsible for the markedly low achievement motivation among Brazilian boys."—L. Berkowitz.

4828. Turner, R. H. (U. California, Los Angeles) **The problems of social dimensions in personality.** *Pacific sociol. Rev.*, 1961, 4, 57-62.—In studies of the relation between culture and personality, an implicit assumption often made is that personality is a closed system. Hence studies are conducted on the distribution of standard personality types or variables between different cultures. A different approach would be to ask to what extent a particular dimension, such as ascendance-submission, is relevant to some cultures. Turner argues that we have usually failed to consider societies as agents which organize personality in different ways—some of which are idiosyncratic, hence noncomparable. Turner illustrates his approach by distinguishing 5 bases for personality classification and by designating some social sources of personality organization.—K. E. Davis.

4829. Wallace, Bruce. (Cornell U.) **"Race and Reason."** *Eugen. Quart.*, 1962, 9(3), 161-162.—In this critical letter to H. E. Garrett, the author lists numerous incorrect, tendentious, propagandistic, or misleading statements in *Race and Reason* by Carleton Putnam. Garrett was one of the signers of the introduction to this book.—S. G. Vandenberg.

SOCIAL STATUS & STRUCTURE

4830. Atherton, Karyl R. (U. California) **A comparison of solutions obtained in factor analyses of socioeconomic variables.** *Psychol. Rep.*, 1962, 11(1), 259-273.—"Socioeconomic data for a sample of the population of Berkeley, California (1929), were subjected to factor analysis and the results compared with those of previous factor analyses of similar variables in studies by Knupfer and by Kahl and Davis. The comparison revealed a marked consistency among the three solutions, all of them yielding two highly correlated factors of which one appears to relate to the acquisition of income and the other to its expenditure on housing and other durable goods. . . . A distinction was drawn between the effects of social mobility (with an attendant lag in residence change) and those of the ordinary phases

of the family life cycle. The latter alone were held to be sufficient to produce the two factors in terms of age variations within the usual sample."—B. J. House.

4831. Cook, David R. **Prestige of occupations in India.** *Psychol. Stud., Mysore*, 1962, 7(2), 31-37.—Occupations with high prestige in India (engineer, doctor, military officer) have in common high salary potential, advanced education, and high social status. These are followed by businessmen, farmers, factory workers, and manual and skilled laborers. For rural people experience and favorable connotations determine occupational prestige.—U. Pareek.

4832. Driver, Edwin D. (U. Massachusetts) **Caste and occupational structure in central India.** *Soc. Forces*, 1962, 41(1), 26-31.—Interview data support the view that the caste system does not prevent occupational mobility. Such change, however, is generally limited to occupations of comparable rank. A positive relationship is noted between educational and occupational levels.—A. R. Howard.

4833. Dye, T. R. (U. Pennsylvania) **Popular images of decision-making in suburban communities.** *Sociol. soc. Res.*, 1962, 47(1), 75-83.—Residents and elected public officials in 16 suburban communities in the Philadelphia Metropolitan Area were questioned to determine whether they perceive community decision-making in an elitist or a pluralist fashion. Interesting differences in perceptions were observed between public officials and residents, and between residents of communities with differing educational and occupational compositions.—*Journal abstract*.

4834. Gibbs, Jack P., & Martin, Walter T. (U. Texas) **Mortality rates and participation in sustenance activities.** *J. Hlth. hum. Behav.*, 1962, 3(2), 112-120.—International comparisons for 35 countries were made concerning the proportion of males (15 years and over) economically active in the population, and 2 measures of mortality: (a) average life expectancy at birth, and (b) infant mortality rate. It was hypothesized that the proportion of economically active would vary directly with the infant mortality rate, and the proportion of economically active would vary inversely with average life expectancy. Both were supported by correlations at the .01 level. Another hypothesis "to the extent that an age group is not physically fit for participation in the labor force there will be a direct relationship among societies between the per cent of the age group in the labor force and age-independent rates of mortality." This too was upheld. However, interpretation of these findings await subsequent research.—L. A. Ostlund.

4835. Jackson, Elton F. (Yale U.) **Status consistency and symptoms of stress.** *Amer. sociol. Rev.*, 1962, 27(4), 469-480.—"The stressful impact of status inconsistency on the individual is examined with national survey data, using psychophysiological symptoms as the indicator of psychological disturbance. Inconsistency due to racial-ethnic rank superior to occupational or educational rank is associated with high symptom levels; although the opposite patterns of inconsistency are not, they have been shown in previous research to be associated with political liberalism. These findings are interpreted to mean that all forms of status inconsistency are psy-

chologically disturbing, but that response to this stress varies with the relative positions of the inconsistent person's achieved and ascribed status ranks and with his achieved status per se. Also, sex appears to influence response to education-occupation inconsistencies. These findings provide support for a multidimensional view of social stratification."—L. Berkowitz.

4836. Kramer, Bernard. (Tufts U. Medical School, Boston) **Man in his social environment: Social structure and behavioral change.** *Correct. Psychiat. J. soc. Ther.*, 1962, 8(2), 75-82.—Ability to change human behavior through manipulation of the social environment is explored. The author concludes that the power to change behavior depends on knowledge of social-environmental factors in behavior, and effective leadership for implementation of ideas.—L. R. Witt.

4837. Mapes, R. E. A. (Oxford U., England) **The development of certain social variables in an English rural context.** *Rural Sociol.*, 1962, 27(2), 208-212.—In 22 villages in the Oxfordshire region, upper class incidence, sociability index, and reading factors were significantly related.—H. K. Moore.

4838. Muir, Donal E., & Weinstein, E. A. (U. Louisville) **The social debt: An investigation of lower-class and middle-class norms of social obligation.** *Amer. sociol. Rev.*, 1962, 27(4), 532-539.—Interviews were held with 120 white adult female residents of Louisville, ½ from lower socioeconomic status (SES) census tracts and the rest residing in upper-middle tracts, in order to test hypotheses, from Simmel and others, derived from economic models of social behavior. "Respondents from both areas seemed to account social obligations, felt that obligations should be voluntarily repaid where possible, and disapproved of debtors who did not do so. . . . Despite disapproval, however, low-SES respondents were unlikely to cut off social credit, while high-SES subjects were likely to do so. . . . high-SES subjects were likely to feel especially willing to do favors 'in return,' while the majority of low-SES respondents reported that this made no difference." The pattern of answers from the low-SES women is indicative of a "modified altruism, in that one gives when able, expecting others to do the same. . . . By contrast, the middle-class pattern more closely paralleled the financial transaction."—L. Berkowitz.

4839. O'Donovan, T. R. (U. Southern California) **Intergenerational educational mobility.** *Sociol. soc. Res.*, 1962, 47(1), 57-67.—In the literature there is no counterpart in the study of educational mobility modeled after the Warner and Abeglen study of American trends in intergenerational occupational mobility. Warner's research has shown that opportunities to rise from the bottom, occupationally, into positions of high leadership in business have widened during the past generation. This analysis attempts to provide a framework for the development of such a model in intergenerational educational mobility. (19 ref.)—*Journal abstract*.

4840. Robins, Lee N., Gyman, H., & O'Neal, P. (Washington U.) **The interaction of social class and deviant behavior.** *Amer. sociol. Rev.*, 1962, 27(4), 480-492.—"Sociologists in investigating the relationship between class and deviance, have almost

exclusively viewed class as the independent and deviance as the dependent variable. This paper, using intergenerational occupational mobility as a measure of class and juvenile anti-social behavior as a measure of deviance, offers evidence that deviance determines class. Former child guidance clinic patients seen for severe anti-social behavior are found 30 years later to have more unfavorable occupational mobility than both former patients seen for other problems and normal school children. Juvenile anti-social behavior appears to affect later occupational status by interfering with educational achievement and by continuation into adulthood, when expressed by poor job performance. The disproportionate incidence of anti-social children in the lower classes apparently can be partially explained by their high rate of anti-social fathers, whose own deviance has determined their low occupational status."—*L. Berkowitz.*

4841. Sadler, P. J. Technical change and military social structure. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 312-324.—The increasing technical complexity of weapons and associated equipment, the increased destructive power of weapons, the rapidity of technical change, and the greatly increased cost of military equipment have all contributed to changes in the military social structure. These changes have largely occurred in the military status system and in the basis and forms of authority. Problems created by these changes need sociological analysis to aid military management in their eventual resolution.—*G. H. Mowbray.*

4842. Simpson, Richard L. (U. North Carolina) Parental influence, anticipatory socialization, and social mobility. *Amer. sociol. Rev.*, 1962, 27(4), 517-522.—Questionnaire data from boys in 2 southern high schools were analyzed for factors influencing boys toward high occupational aspirations. "Among boys aspiring to high occupations, the percentage whose parents had advised them to enter professions was much higher than the percentage among low-aspirers," indicating that parental influence is a factor in the upward mobility of middle-class as well as lower-class boys. "Mobile working-class boys were much higher than nonmobile working-class boys and somewhat higher than unambitious middle-class boys in the percentage who said that they had middle-class friends," and also in the number of extracurricular clubs to which they belonged, indicating that "anticipatory socialization into middle-class values by middle-class peer groups helps to explain the upward mobility of working-class boys. . . . A working-class boy was most likely to aspire to a high-ranking occupation if he had been influenced in this direction by both parents and peers, and least likely to be a high-aspirer if he had been subjected to neither of these influences. Among the middle-class boys, only those low in both influences differed significantly from the rest."—*L. Berkowitz.*

4843. Thomas, R. Murray, & Surachmad, Winarno. Social-class differences in mothers' expectations for children in Indonesia. *J. soc. Psychol.*, 1962, 57(2), 303-307.—A comparison of child-raising practices of 100 upper-middle-class with 100 lower-class mothers in Bandung, Indonesia, showed upper-middle mothers expected earlier weaning, reading, and writing. Lower-class mothers expected earlier counting. Differences in expectation for un-

supervised play and for a child's feeding himself were not significant.—*Author abstract.*

4844. Upchurch, Harley M. (Louisiana State U.) A tentative approach to the study of mortality differentials between educational strata in the United States. *Rural Sociol.*, 1962, 27(2), 213-217.—The survival advantage of the college educated decreases in old age, while the survival advantage of the high school graduate increases. Explanations are suggested.—*H. K. Moore.*

ATTITUDES & OPINIONS

4845. Anisfeld, Moshe; Munoz, Stanley R., & Lambert, Wallace E. (McGill U.) The structure and dynamics of the ethnic attitudes of Jewish adolescents. *J. abnorm. soc. Psychol.*, 1963, 66(1), 31-66.—A factorial analysis was carried out on a variety of measures obtained from 100 Jewish high school students in Montreal. A general factor composed of negative attitudes to Jews and to gentiles, a hostile disposition to people, and verbal aggression against nonconformists was isolated. This factor, reflecting a generally negative social orientation, is independent of 2 other factors representing attitudes to parents and attitudes to self. The factorial structure suggests that manifest hostility is a possible mediating variable linking all 3 factors. (23 ref.)—*Journal abstract.*

4846. Brown, L. B., & Pallant, D. J. (U. Adelaide) Religious belief and social pressure. *Psychol. Rep.*, 1962, 10, 813-814.—Measures of religious belief were obtained from [25] adolescents under conditions of positive and negative social pressure. Positive pressure produced a significant change in stated beliefs towards an 'expert's' opinion, showing that religious beliefs are susceptible to social influences, as are attitudes and opinions.—*B. J. House.*

4847. Bull, Nina. The body and its mind: An introduction to attitude psychology. New York: Las Americas, 1962. 99 p. \$3.50.—Presentation of a theory and system which "is a modification and extension of James' Theory and rests on his main contention that feelings in emotion are the feelings of bodily changes which occur as a direct response to stimulation. . . . The bodily changes that lead to feeling in emotion are shown as due to the initial step in a response—that is, to a preparatory motor attitude—held up from going into action." Experimental results supporting the theory are presented from 2 series of experiments with hypnotic Ss, one based on 10 Ss in 60 sessions, the other involving 100 experiments employing 5 normal Ss.—*E. D. Lawson.*

4848. Christenson, Reo M., & McWilliams, Robert O. (Eds.) Voice of the people: Readings in public opinion and propaganda. New York: McGraw Hill, 1962. 585 p. \$4.95.—"There has long been a need . . . for a nontechnical book of readings on public opinion and propaganda designed to contribute broadly to students' liberal education." Sample chapter headings are "The Nature of Public Opinion," "The Mass Media: The Role of the Press," "The Tyranny of Majority Opinion," and "The Nature of Propaganda." The book contains 107 separate essays written by a variety of authors including Plato, Bertrand Russell, Walter Lippman, Adlai Stevenson, John Stuart Mill, Harold D. Lasswell, Paul Lazars-

field, Aldous Huxley, Richard Nixon, Vance Packard, and many others.—*W. Koppe.*

4849. Cole, D. L., Hartry, Arlene, & Brebner, Linda. Attitudes to Caryl Chessman as a function of his reprieve and execution. *J. soc. Psychol.*, 1962, 57(2), 471-475.—Item analysis of responses to a 32-item attitude scale reflecting attitudes toward Caryl Chessman revealed changes which seemed related to steps in the progress of his case. Following a last minute reprieve there was considerable diversity of change. Following his execution, all of the shifts in item endorsements appeared to be in the direction of justifying the execution.—*Author abstract.*

4850. Das, J. P., & Nanda, P. C. (Utkal U., Cuttack, India) Mediated transfer of attitudes. *J. abnorm. soc. Psychol.*, 1963, 66(1), 12-16.—Attitudes cannot only be acquired, but may also be transferred like verbal conditioned responses. This was shown by associating a nonsense syllable with the name of a tribe, then developing a favorable or unfavorable attitude towards the nonsense syllable and subsequently testing whether such an attitude had been transferred to the tribe. 2 nonsens syllables and 2 names of tribes were chosen as stimuli in a counter-balanced, sensory preconditioning design, requiring 4 groups of 20 Ss. A notable feature was the use of probability learning during the conditioning period; the probability of occurrence of Good or Bad after a nonsense syllable being .85. Transfer, which was successful, was tested in 2 ways: by requiring Ss to choose 10 out of a mixed list of 20 favorable and unfavorable attributes for each tribe and by rating each tribe on a semantic differential scale of Good-Bad.—*Journal abstract.*

4851. Diab, Lutfy N. (U. Beirut) National stereotypes and the "reference group" concept. *J. soc. Psychol.*, 1962, 57(2), 339-351.—The Katz and Braly technique was used in an investigation of the stability and generality of stereotypes assigned to 13 national groups by 106 male undergraduate Arab students at the American University of Beirut. The results showed that, in general, stereotypes attributed to various national groups tend to persist and change very little, if any, with the passage of time. However, the stereotyping of a particular national group was found to be, in part, a function of the respondent's "reference group" membership. Thus, significant differences in the stereotyping of certain national groups were found to exist between Arab Christians and Arab Moslems. Furthermore, the S's political group membership was also found to affect significantly the stereotypes he assigns to certain national groups.—*Author abstract.*

4852. Ex, J., & Bezembinder, T. G. G. Ervaring van overeenstemming en kijk op de ander. [Feeling of similarity and understanding the other.] *Gawein*, 1962, 11(1), 1-14.—The feeling of similarity in behavior, experienced by one person judging another, was handled as an independent variable in an experiment. The results proved the opinion formed was influenced by this experience and based on actual assumption of similarity between judge and S. However, accurate judging is not necessarily founded on empathy or assumed similarity. (English summary) —*J. A. Lückner.*

4853. Facen, Geneva. (Grambling Coll., La.) Determination of the degree of tension produced

in white students when presented with certain materials regarding Negroes. *J. educ. Res.*, 1962, 55(7), 307-311.—Scores on the Purdue scale, computed for attitude toward Negroes, formed the basis for the selection of the Ss to be observed. The major thesis was that tensions would be created during a discussion pertaining to Negroes. This assumption was based on the idea that different attitudes toward the Negro would produce varying degrees of tension, which could be objectively measured. 3 major aspects of the emotional tension reactions were taken into account: the skeletal or overt behavior, visceral behavior, and emotional experience. Observable tension was produced in white Ss when presented with certain unfounded beliefs and with factual materials pertaining to Negroes.—*F. Goldsmith.*

4854. Feshbach, S. (U. Pennsylvania) The consequences of fear-arousal in public health education. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 99-112.—Sources of interference with the acceptance of recommendations are named; the arousal of fear is also discussed. An experiment on dental hygiene utilizing 3 intensities of fear arousal is described. Greatest conformity accompanied lowest fear appeal, as did resistance to counterarguments a week later. Other studies are mentioned and discussed. It is concluded that fear is an unsatisfactory appeal.—*B. T. Jensen.*

4855. Francesco, E. (Middleton, Wis.) A pervasive value: Conventional religiosity. *J. soc. Psychol.*, 1962, 57(2), 467-470.—Conventional religiosity appears to be pervasively related to personality inventory scales. It is possible to view these relationships as an opportunity to understand types of individuals in terms of their personality characteristics. On the other hand, from a point of view of understanding behavior it may be convenient and important to stress the institutional bases of behavior. Knowing the religious orientation of a client, a clinician may be able to anticipate important sectors of personality concomitants. The findings on a relatively specific institutional orientation reported here suggest that investment in research on institutional value orientations and personality correlates may be extremely fruitful.—*Author abstract.*

4856. Glock, Charles Y. (U. California, Berkeley) On the study of religious commitment. *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 98-110.—The identification of measurable dimensions in the analysis of religious commitment is discussed.—*S. A. Walters.*

4857. Goguel, C. Sur un essai d'application de la théorie des facettes de Guttman. [Essay on the application of Guttman's facet theory.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(4), 445-454.—"This theory is aimed at predicting the structure of a correlation matrix made from attitudes scales taken by pairs. In this study attitudes towards the army are evaluated by the mean of four scales using four types of questions with a definite semantic structure: stereotypes, norms, assumed behavior, previous behavior. The coefficients obtained do not exactly reflect the expected structure; several explanations are given. A second exposition of the facets stresses the interest of using them to analyze a problem and write a questionnaire provided particular attention is given to the semantic structure of the questions."—*V. Sanua.*

4858. Gorfein, David S. (Utah State U.) **Phenomenal regression and the need for control groups in attitude change studies.** *Psychol. Rep.*, 1962, 11(1), 23-24.—Following an attitude test, 2 experimental groups received advocacy at a point either close to or distant from initial opinion, while a control group received no advocacy. Upon retest, attitude change of the control group was greater than the close, but less than the distant advocacy group. Results are discussed in relation to dissonance theory, and the suggestion made that "apparent effects of distance of advocacy may be due to a limitation on movement by the placement of the advocacy."—B. J. House.
4859. Grunberger, Béla. **Der Antisemit und der Ödipuskomplex.** [The anti-Semite and the Oedipus complex.] *Psyche, Stuttgart*, 1962, 16(5), 255-272.—The anti-Semite experiences the Jew as the bad father, and simultaneously as the castrated father. Thus he can abreact his unresolved Oedipal hostility toward the Jew and preserve a good father image. In the history of religion such an attitude toward the Jew may be linked with the Hebrew establishment of the father as divine figure out of the historically antecedent matriarchal worship.—E. W. Eng.
4860. Handlin, Oscar. (Ed.) **Ethnic groups in American life.** *Daedalus*, 1961, 90(2), 220-349.—Of the 7 papers devoted to the title's theme, the paper by Handlin is a brief historical introduction; those by Kenneth D. Benne ("The Uses of Fraternity"), J. Milton Yinger ("Social Forces Involved in Group Identification or Withdrawal"), Milton M. Gordon ("Assimilation in America: Theory and Reality"), and Joshua A. Fishman ("Childhood Indoctrination for Minority-Group Membership") are primarily integrative and analytic treatments of different aspects of minority-majority relations. The papers by Ozzie G. Simmons and by Peter H. and Alice S. Rossi are research reports, the former dealing with mutually-held stereotypes in a southern Texas border town and the latter with some effects of parochial-school education.—K. E. Davis.
4861. Haward, L. R. C. **Attitudes towards respiratory apparatus and their relation to stress reactivity.** *Brit. J. med. Psychol.*, 1962, 35(3), 225-232.—Responses to face masks were studied in relationship to previous experience with and experimentally induced changes in attitudes toward gas anaesthesia. Ss were 60 male psychoneurotic patients varying in age from 20 to 40 years. Experience and attitudes were related to responses. "The implications of these findings—in relation to studies of suggestibility in placebo-reactions and hypnosis—are discussed. A plea is made for greater insight into the meaning which any experimental situation has for the subject."—C. L. Winder.
4862. Hochheimer, Wolfgang. **Vorurteilsverminderung in der Erziehung und die Prophylaxe des Antisemitismus.** [Reducing prejudice through education and the prevention of anti-Semitism.] *Psyche, Stuttgart*, 1962, 16(5), 285-294.—If education is to effectively work against anti-Semitism, it cannot limit itself to methods that leave out the expression of feelings and emotions.—E. W. Eng.
4863. Keats, J. A. (U. Queensland) **Attitudes towards idealized types in Australia and Malaya.** *J. soc. Psychol.*, 1962, 57(2), 353-362.—Attitudes towards ideal types of persons, saints, scholars, artists, and heroes were assessed by rank order methods for Australian and Malayan Ss. The "unfolding" method provided a common space within which these 2 cultures could be compared. Perceptual distortion of Ss at different positions in this space was demonstrated.—*Author abstract.*
4864. Kelman, H. C. (Harvard U.) **The induction of action and attitude change.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 81-110.—5 hypotheses as to why induced action should lead to attitude change are presented and the matter discussed in Lewinian terms.—B. T. Jensen.
4865. Leary, T. (Harvard U.) **How to change behavior.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 50-68.—Behavior is a game with roles, rules, etc. We play all kinds of games. Western and Eastern peoples have different understandings of the games of life. A study of 146 persons who used psilocybin is reported; 3 out of 4 reported happy and insightful reactions. It is suggested that new roles and rules could be taught when free of traditional limitations. The author describes an on-going experiment in rehabilitation of prisoners.—B. T. Jensen.
4866. Lindgren, Henry Clay. (San Francisco State Coll.) **Authoritarian, independence, and child-centered practices in education: A study of attitudes.** *Psychol. Rep.*, 1962, 10, 747-750.—"An analysis of the questionnaire responses of a sample of Laundromat customers [N = 150] showed significant and positive correlations among years of education completed and attitudes characterized by equalitarianism, independence, and acceptance of child-centered practices in education. Age was negatively correlated with these attitudes."—B. J. House.
4867. McCarthy, John, & Johnson, Ronald C. (San Jose State Coll.) **Interpretation to the "City Hall Riots" as a function of general dogmatism.** *Psychol. Rep.*, 1962, 11(1), 243-245.—"Two samples of Ss [157 students from two different colleges] indicated their attitudes regarding the causes of the "City Hall Riots" and were also administered Rokeach's dogmatism scale. Ss low in the dogmatism, as compared with the remainder of their sample, generally accepted the student account of the disturbance while Ss comparatively high in dogmatism more often accepted the police version of the events leading to the incident. Ss who were neutral in their opinions concerning the "Riots" fell between the other two groups in D score."—B. J. House.
4868. McNulty, John A., & Walters, Richard H. (U. Toronto, Canada) **Emotional arousal, conflict, and susceptibility to social influence.** *Canad. J. Psychol.*, 1962, 16(3), 211-220.—After completing an attitude inventory, electrodes were attached to S's wrist, forearm and neck for EMG and GSR recording, and he participated in a discussion with 2 confederates of the E. Ss who received anxiety-inducing instructions and were exposed to opinions that strongly conflicted with their own showed more muscle tension that did the others. They also revealed the greatest attitude change.—R. S. Davidson.

4869. Mitscherlich, Alexander. *Die Vorurteilsskrankheit: Einleitung zum Thema*. [Prejudice as illness: Introduction to the theme.] *Psyche, Stuttgart*, 1962, 16(5), 241-245.—Introduction to a symposium on the psychological and social conditions of anti-Semitism held at Wiesbaden on May 5, 1962 (see 37: 4859, 4862, 4878, 4880, 4881). Cultural control of aggression has had limited success. Prejudices, in this connection, can have contrasting kinds of effects; either for controlling aggression in the service of culture or decontrolling aggression in relation to imagined or actual enemies.—E. W. Eng.

4870. Morland, J. Kenneth. (Randolph-Macon Woman's Coll.) *Racial acceptance and preference of nursery school children in a southern city*. *Merrill-Palmer Quart.*, 1962, 8(4), 271-280.—Picture-choice data from 407 Negro and white nursery school children revealed few rejections and a high percentage of acceptance. Both Negro and white Ss tended to prefer the white children in the pictures, manifesting racial "bias" rather than prejudice. Age and social class differences were analyzed.—E. L. Robinson.

4871. Palmore, E. (Yale U.) *Sociologists' class origins and political ideologies*. *Sociol. soc. Res.*, 1962, 47(1), 45-50.—The class origins and political ideologies of sociology's founding fathers and of 405 modern sociologists are examined. It is found that the founders from the lower classes had leftist ideologies while those from the middle and upper classes had center or rightist ideologies. In contrast, modern sociologists from the lower classes vote Republican more often than those from the middle and upper classes. Possible explanations are discussed.—*Journal abstract*.

4872. Paul, B. D., Green, A. L., Simmel, Arnold; Kirscht, J. P., Knutson, A. L., Raulet, H. M., Sanders, I. T., Gamson, W. A., Irons, P. H., & Kegeles, S. S. *Trigger for community conflict: The case of fluoridation*. *J. soc. Issues*, 1961, 17(3).—This entire issue is devoted to an analysis of the psychological issues involved in community decisions about fluoridation. The content ranges from an attempt to identify characteristics of individuals who oppose or support programs of fluoridation to an attempt to isolate demographic variables that might differentiate among successful and unsuccessful attempts to institute fluoridation programs.—A. Barclay.

4873. Rao, N. C. S. *Factor analysis of social attitudes*. *Psychol. Stud., Mysore*, 1962, 7(2), 43-54.—A social attitude scale for conservatism-radicalism was constructed. The scale consists of 33 items and has a reliability coefficient of .90. Factor analysis with the centroid method with rotation gave 3 bipolar factors. 2 factors are identified as radicalism-conservatism and authoritarianism. The 3rd factor, consisting mostly of negative loadings, contributed only 6% to the total variance and its nature could not be clearly identified. The scale appears in the appendix.—U. Pareek.

4874. Rhyne, Edwin H. (Coll. William & Mary) *Racial prejudice and personality scales: An alternative approach*. *Soc. Forces*, 1962, 41(1), 44-53.—Questionnaire data from 325 college freshmen lend a greater degree of support to a sociological than to an "authoritarian personality" view of racial and ethnic prejudice. Despite expressed limitations, the

study favors a differential learning approach to the problem of individual variations in prejudice. Thus primary attention is directed to the structural situation in which prejudice emerges and away from an individualistic view.—A. R. Howard.

4875. Sartre, Jean-Paul. *Anti-Semite and Jew*. New York: Grove, 1962. 153 p. \$.50 (paper).—A paperback edition of a book published in 1948 under the title *Reflexions sur la Question Juive* (see 23: 4214).—C. T. Morgan.

4876. Schein, Edgar H. (Massachusetts Inst. Technology) *Man against man: Brainwashing*. *Correct. Psychiat. J. soc. Ther.*, 1962, 8(2), 90-97.—Description of the Chinese Communist methods of producing change in behavior and attitudes. Social support is viewed as the key factor in the attitude change process. That is, supports for old attitudes must be undermined, and supports for new attitudes must be introduced in order to make for lasting attitude change. The basic method of influence appears to be similar to that which is used in our own rehabilitative institutions, i.e., prisons and mental hospitals.—L. R. Witt.

4877. Schein, Edgar H., & Singer, Margaret T. (Massachusetts Inst. Technology) *Follow-up intelligence test data on prisoners repatriated from North Korea*. *Psychol. Rep.*, 1962, 11(1), 193-194.—"A sample of 60 repatriated prisoners of war from Korea were given the verbal scales of the Wechsler-Bellevue Adult Intelligence Scale I immediately after repatriation and again 3 to 5 yr. later. Differences found between alleged collaborators and non-collaborators at the time of first testing were smaller at the time of second testing, lending some support to the interpretation that the differences were due to situational factors rather than basic intelligence differences."—B. J. House.

4878. Silberman, Alphons. *Zur Soziologie des Antisemitismus*. [The sociology of anti-Semitism.] *Psyche, Stuttgart*, 1962, 16(5), 246-254.—The unsystematic character of research in anti-Semitism has contributed to its lack of social impact. In carrying out such research studies it is important to start from the specific manifestation of the anti-Semitism socially, then to develop an understanding of the prejudice in individual terms, and from this inferences about the anti-Semitic personality.—E. W. Eng.

4879. Tuddenham, Read D. (U. California, Berkeley) *Constancy of personal morale over a fifteen-year interval*. *Child Developm.*, 1962, 33(3), 663-673.—"Responses to a brief morale questionnaire showed a modest degree of temporal constancy across an interval of 15-plus years involving the age range from 18 years to 33 years. Items tapping attitudes toward education were most constant. . . . Opinions on other topics e.g., the fairness of the courts, the importance of the individual, etc., were less constant, yielding significant stability coefficients for one sex and not for the other. Items relating more to the individual . . . were notably lacking in temporal constancy. Sex differences were small. . . . There was a general tendency for adult judgments to be more homogeneous than was true for adolescents."—W. J. Meyer.

4880. von Baeyer-Katte, Wanda. *Nachträgliche Gedanken zu einem Symposium über die psychologischen und sozialen Voraussetzungen des Anti-*

semitismus. [After-thoughts to a symposium on the psychological and social presuppositions of anti-Semitism.] *Psyche, Stuttgart*, 1962, 16(5), 312-317.—The active anti-Semite must be seen in the context of a group. The young Nazi group sought to regressively reestablish the warm family group of which they had been deprived in early childhood. The actively anti-Semitic figure acted out their hostility for them, while at the same time certain other figures, "noble Nazis" to whom they looked up, served to mask from their awareness their participation in sadistic destruction.—E. W. Eng.

4881. Wangh, Martin. *Psychoanalytische Betrachtungen zur Dynamik und Genese des Verurteils, des Antisemitismus und des Nazismus*. [Psychoanalytic observations on the dynamics and development of prejudice, anti-Semitism and Nazism.] *Psyche, Stuttgart*, 1962, 16(5), 273-284.—Why did the young adults of the early Nazi period react to economic depression with regression, projection, and sadism? Hypothesis: a decisive predisposing factor lay in the personality effects of the 1st World War on the children of that period, as a consequence of paternal absence, increased maternal dependency, etc. Today an economic or social catastrophe could once more unleash such a massive regression among the war-disturbed young adults of Germany or other countries.—E. W. Eng.

4882. Winick, C. (Columbia U.) Space jokes as indications of attitudes toward space. *J. soc. Issues*, 1961, 27(2), 43-49.—An analysis of space jokes indicated that this form of humor can be seen as an attempt to assimilate the space phenomena into our own cultural frame of reference and perhaps to minimize the latent anxiety inherent in explorations of the unknown.—A. Barclay.

GROUP INFLUENCES

4883. Borah, Lee A., Jr. (Wagner Coll.) The effects of threat in bargaining: Critical and experimental analysis. *J. abnorm. soc. Psychol.*, 1963, 66(1), 37-44.—A 1st experiment replicated the main result of the Deutsch and Krauss experiment which showed that the presence of barriers in the bargaining situation led to poorer outcomes for the players. It also indicated, however, that the main results obtained by Deutsch and Krauss and the similar ones found in the present experiment are probably due to the spurious effect of the length of the longer pathway and the lack of comparability between conditions. In a 2nd experiment, the introduction of electric shock—whether given no interpretation, interpreted as a means of coercing the other to yield, or interpreted as a means of threatening future unpleasantness—did not significantly change the outcomes for the bargainers.—*Journal abstract*.

4884. Maisonneuve, Jean. *L'élaboration des sociogrammes individuels et l'analyse dyadique*. [The elaboration of individual sociograms and dyadic analysis.] *Psychol. Franc.*, 1962, 7(2), 156-160.—A new method of analysis is discussed.—C. J. Adkins.

4885. Mills, T. M. (Yale U.) A sleeper variable in small group research: The experimenter. *Pacific sociol. Rev.*, 1962, 5(1), 21-28.—Mills argued that the role of E and his relation to his Ss has seldom been considered in small group research and that this omission has led to inadequate analysis of the experi-

mental setting and faulty interpretations of data. The failure of the E to consider his effects on his results derives from 2 sources: (a) a defensive attempt to minimize his ignorance vis-a-vis the complex processes of social interaction and (b) a defensive attempt to minimize his own uncertainty about his adequacy as an E. To provide a concrete example, Mills reanalyzed Schachter's study, "Deviation, Rejection, and Communication" (see 25: 8043) and suggested that the data could be interpreted by assuming that the E had differentially violated group norms in different experimental conditions.—K. E. Davis.

4886. Moore, Omar K., & Anderson, Alan R. (Yale U.) Some puzzling aspects of social interaction. *Rev. Metaphys.*, 1962, 15, 409-433.—Certain activities referred to as "autotelic" are undertaken by human beings solely for fun. These fall into 2 categories: (a) puzzles, which are probabilistic and noninteractional and (b) games, which are interactional, strategic, and applicable to game theory. Neither applies to the constant changes in human interactions. Instead of attempting to predict and control human behavior through experiments dealing with artificially separated, minute aspects of behavior, "folk-model" type experimental situations should be set up in which actual creativity and inventiveness can be developed. (34 ref.)—L. W. Brandt.

4887. Penny, R., & Robertson, L. (U. Adelaide) The Homans sentiment/interaction hypothesis. *Psychol. Rep.*, 1962, 11(1), 257-258.—"Homans' hypothesis concerning the relationship between sentiment and interaction is confirmed by small groups experiment with previously unacquainted Ss who were concealed from one another and for whom communication was restricted to brief written messages."—B. J. House.

4888. Shaw, Marvin E. (U. Florida) Implicit conversion of fate control in dyadic interaction. *Psychol. Rep.*, 1962, 10, 758.—In a 2-S, 2-choice situation, responses of each S determined the rewards of the other. Of 5 dyads instructed to cooperate, all 5 stabilized responding on high outcome alternatives, while of 18 given no instructions, 2 dyads stabilized on high outcome, 7 on low outcome responses, and 9 failed to stabilize.—B. J. House.

4889. Shaw, Marvin E., & Shaw, Lilly May. (U. Florida) Some effects of sociometric grouping upon learning in a second grade classroom. *J. soc. Psychol.*, 1962, 57(2), 453-458.—This study investigated the relationship between sociometric structure (cohesiveness) of 3-person groups and learning to spell in a 2nd-grade class. 6 groups were tested 8 times on 4 different word lists and in 4 different sociometric structures. The results indicated that high cohesive groups are more democratic, friendly, and cooperative than are low cohesive groups. Learning to spell correlated positively with cohesiveness in the early phases of interaction, but not in later phases.—*Author abstract*.

LEADERSHIP

4890. Elkin, Frederick; Halpern, Gerald, & Cooper, Anthony. (McGill U., Canada) Leadership in a student mob. *Canad. J. Psychol.*, 1962, 16(3), 199-201.—Fraternity pledges were observed in 2 situations leading to mob action. Of 20, the 5 who demonstrated leadership in the contrived situa-

tion were among the 6 leaders in an episode at a football game. Given a Gordon Personal Profile, mob leaders scored higher than followers on ascendancy and sociability and lower on emotional stability.—*R. S. Davidson.*

4891. Lange, Carl J. **Leadership in small military units: Some recent research findings.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 286-301.—Several research studies dealing with the leadership process in small military units are described, and an outline is provided of a way of thinking about such problems. The results indicate that the leader plays an active part in facilitating performance and in reducing disruptive influences. A leadership training program was evolved that takes these findings into account.—*G. H. Mowbray.*

4892. Palmer, George J. (Louisiana State U.) **Task ability and effective leadership.** *Psychol. Rep.*, 1962, 10, 863-866.—"Sixteen male students took a 40-item multiple-choice examination for course credit. The examination was taken, first by each privately, then by consenses of four-man groups, then again privately by each student. Task ability was found to account for an average of 88% of the variance in effective leadership, thus supporting the hypothesis as to the significance of task ability for effective leadership."—*B. J. House.*

4893. Prentice, W. C. H. (Swarthmore Coll.) **Understanding leadership.** *Harv. bus. Rev.*, 1961, 39(5), 143-151.—A leader must accomplish a group goal by providing some direction to his human assistants, the group members. He must help each to see how a personal motive can be satisfied in the process of reaching the group goal. Some of the pitfalls in leader-follower relationships are explained.—*C. F. X. Youngberg.*

LANGUAGE & COMMUNICATION

4894. Bialek, Hilton M., Walker, Jerald N., & Hood, Joanne H. **Exploratory efforts concerned with a study of the interrogation process: Survey activities, conceptualization and pilot studies.** *HumRRRO res. Memo.*, 1962, Task Quiz. 21 p.—A survey of interrogation literature and practices was background for a pilot study showing that information obtained, Ss' reactions, and resistance can be quantified.—*R. Tyson.*

4895. Doob, Leonard W. **Communication in Africa: A search for boundaries.** New Haven, Conn: Yale Univer. Press, 1961. xvi, 406 p. \$7.50.—12 critical variables that affect communication are analyzed and illustrated by reference to sub-Saharan African societies: the communicator; his goal, the basic and extended media; the site; the restrictions; the communication itself; the mood, perception, reaction and behavior changes of the audience; and the effect of communication as perceived by the communicator.—*C. W. Page.*

4896. Novaes, Maria Helena. **Problemas de linguagem e comunicação.** [Problems of speech and communication.] *Arqu. Brasil. Psicotec.*, 1961, 13 (2), 13-19.

4897. Newbigging, P. L., & Hay, Janet M. (McMaster U., Canada) **The practice effect in recognition threshold determinations as a function of word frequency and length.** *Canad. J. Psychol.*,

1962, 16(3), 177-184.—Visual duration thresholds decreased with practice, an effect related to both the frequency and the length of the stimulus words. Thresholds for less frequent and long words showed the greatest decrement as a function of serial position. The results are consistent with an associative interpretation and inconsistent with one in terms of improved discrimination.—*R. S. Davidson.*

4898. Rosenzweig, Mark R., & McNeill, David. (U. California, Berkeley) **Inaccuracies in the semantic count of Lorge and Thorndike.** *Amer. J. Psychol.*, 1962, 75(2), 316-319.—A comparison of data from 4 publications (Lorge & Thorndike, Thorndike & Lorge, Lorge, & West) discloses many discrepancies and errors. Size of sample for the count is given variously in the different publications. The value given for a word in Thorndike and Lorge is sometimes greater than and sometimes less than that given by the other sources. A comparison of West with Thorndike and Lorge revealed a median difference in frequency of about 9% based on a sample of 54 words.—*R. D. Nance.*

Speech & Linguistics

4899. Delattre, Pierre. (U. Colorado) **Some factors of vowel duration and their cross-linguistic validity.** *J. Acoust. Soc. Amer.*, 1962, 34(8), 1141-1143.—"New facts and new arguments are furnished which reinforce the theory according to which: (a) many variations in vowel duration are physiologically conditioned, (b) and those variations that are conditioned, and not phonemically learned, are due to factors that are cross-linguistically valid."—*A. M. Small, Jr.*

4900. Floyd, Richard L. (U. Minnesota) **Semantic satiation: Replication and test of further implications.** *Psychol. Rep.*, 1962, 11(1), 274.—Doubtful support was found for a finding by Lambert and Jakobovits (see 35: 4474) that words repeatedly emitted suffer a "loss of meaning" as measured by pre- and post-test semantic differential ratings. There was no generalized satiation of semantically similar words.—*B. J. House.*

4901. Fulton, Robert T., & Spuehler, Henry E. (Purdue U. Speech & Hearing Clinic) **Effects of frequency filtering and delayed sidetone on vocal responses.** *J. speech hear. Res.*, 1962, 5(4), 382-386.—25 normal hearing college students were subjected to 15 conditions of sidetone varied by means of combinations of 5-band pass frequency filtering and 3 delayed sidetone conditions. Words per minute are more affected by delay conditions than are phonation-time ratios. Words per minute differ only with combinations of conditions employing delays.—*M. F. Palmer.*

4902. Glanzer, Murray. (School Medicine, U. Maryland) **Toward a psychology of language structure.** *J. speech hear. Res.*, 1962, 5(4), 303-314.—Recent linguistic work has been outlining a simple and orderly grammatical structure for language and has stimulated experimental work necessary for the construction of a general theory. 2 aspects of language that are considered are: (a) the rules, structures, and transformations that make up the syntax and, (b) the classes of items that the syntax orders. Such grammatical linguistics present a basis for psychological experimentation and the de-

scription and analysis of children's early word combinations, the tracing of changes in verbal performance, and the demonstration and analysis of the effects of grammatical categories on adult verbal performance.—*M. F. Palmer.*

4903. Harms, L. S. (Louisiana State U.) **Listener comprehension of speakers of three status groups.** *Lang. Speech*, 1961, 4(2), 109-112.—"Listeners of 3 [social] statuses attempt to reconstruct spoken messages of speakers of 3 statuses. Speakers of high status were most comprehensible. However, listeners achieved highest relative comprehension when speaker and listener status coincided."—*A. E. Horowitz.*

4904. Hedman, Charles R. **Design for interaction analysis in the classroom.** *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1962, No. 1, 4-5.—A condensed report on applying interaction analysis to the study of pupil and teacher verbal behavior. The resulting matrices are compared by the Darwin Analysis which is based upon the likelihood ratio criterion:

$$\frac{2(\sum_{jk} \log_e n_{jk1} - \sum_{jk} \log_e n_{jk} + \sum_{jk} \log_e n_{jk} - \sum_{jk} \log_e n_{jk})}{\sum_{jk} \log_e n_{jk} + \sum_{jk} \log_e n_{jk}}$$

—*J. G. Cooper.*

4905. Horton, David L., Marlowe, David, & Crowne, Douglas P. (U. Kentucky) **The effect of instructional set and need for social approval on commonality of word association responses.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 67-72.—This study investigated the effect of various instructional sets (speed, relaxed time instructions, and "set popular" instructions) on commonality of word associations. Findings were generally supportive of the hypotheses: significantly more common associations were given under speed as compared to relaxed instructions, Ss were able to significantly increase their commonality scores under a set to give popular responses, and need for social approval was differentially related to commonality under relaxed but not under speed instructions. Contrary to a suggestion of Jenkins, social sensitivity (as reflected in the need for approval measure) was not related to the ability to increase one's commonality score under "set popular" instructions. (17 ref.)—*Journal abstract.*

4906. Manley, Harold J. (Sylvania Electric Products, Waltham, Mass.) **Fourier coefficients of speech power spectra as measured by autocorrelational analysis.** *J. Acoust. Soc. Amer.*, 1962, 34(8), 1143-1145.—"Time-domain speech processors, that analyze the short-time autocorrelation function in terms of a set of orthogonal functions, are shown to yield parameters that are the coefficients of a generalized Fourier cosine series representation of the speech power spectrum."—*A. M. Small, Jr.*

4907. Maussen, L. H. M. **Taal en gesticiek.** [Language and gesticulation.] *Gawein*, 1962, 11(1), 15-47.—Verbal fluency appears related to variety of gestures (correlation coefficient 0.49 ± 0.28). S's amount of inner feelings, intellectuality, attitude towards himself in a certain situation, and his opinion of the person(s) he was talking to appeared to be very important factors.—*J. A. Lucker.*

4908. Olson, Harry F., Belar, Herbert, & de Sobrino, Ricardo. (RCA Lab. Princeton, N. J.) **Demonstration of a speech processing system con-**

sisting of a speech analyzer, translator, typer, and synthesizer. *J. Acoust. Soc. Amer.*, 1962 34(10), 1535-1538.—A public demonstration of a rudimentary speech-processing system consisting of a speech analyzer, language translator, type decoder, and speech synthesizer has been made. Each word spoken into the microphone was analyzed, converted to a syllable code, transmitted as a syllable code, synthesized to speech, or converted to the typed page either in the same language or other languages. The 2 language inputs were English and French, the synthesized speech outputs were English, French, and Spanish and the typed outputs were English, French, German, and Spanish.—*A. M. Small, Jr.*

4909. Rosenzweig, Mark R., & McNeill, David. (U. California, Berkeley) **Uses of the semantic count in experimental studies of verbal behavior.** *Amer. J. Psychol.*, 1962, 75(3), 492-495.—It is helpful to know how usage of a word is apportioned among its various meanings. The semantic count by Lorge and Thorndike in the 1930's is of limited practical use. A simplified abridgement by West is illustrated together with ways in which it may be used. It is demonstrated that a word presented in isolation is usually taken in the sense of its predominant meaning.—*R. D. Nance.*

4910. Saporta, Sol. (Ed.) (Indiana U.) **Psycholinguistics: A book of readings.** New York: Holt, Rinehart & Winston, 1961. xv, 551 p. \$7.50.—A set of 44 readings is offered to fulfil the purpose of facilitating "interdisciplinary communication by providing students of language with materials dealing with a variety of problems where collaboration between psychologists and linguists promises to be fruitful." The readings are organized into 8 categories: "The Nature and Function of Language," "Approaches to the Study of Language," "Speech Perception," "The Sequential Organization of Linguistic Events," "The Semantic Aspects of Linguistic Events," "Language Acquisition, Bilingualism, and Language Change," "Pathologies of Linguistic Behavior," and "Linguistic Relativity and the Relation of Linguistic Processes to Perception and Cognition."—*C. J. Adkins.*

4911. Szalay, Loránd. (Psychologisches Inst., U. Wien) **Untersuchungen zur semantischen Struktur der Zeitwörter.** [Investigations of the semantic structure of verbs.] *Z. exp. angew. Psychol.*, 1962, 9(1), 140-163.—20 psychology and German majors evaluated 160 verbs according to 15 categories. Word profiles and type profiles were constructed based on these judgments. The results indicated that verbs not only carry a particular meaning, that is, express specific characteristics in varying degrees of intensity, but that they determine also the relationship of the sentence elements to each other and influence their meaning.—*W. J. Koppitz.*

4912. Walters, Richard H., & Henning, G. Bruce. (U. Toronto, Canada) **Social isolation, effect of instructions, and verbal behaviour.** *Canad. J. Psychol.*, 1962, 16(3), 202-210.—High school boys, who volunteered to serve in an experiment on "Speaking ability and time judgments," spoke extemporaneously before and after a 3- or 6-hour period of either social isolation or interaction. Isolation had no consistent effect on rate of speech or number of affiliative statements during the final

speeches. Ego-oriented instruction led to more rapid speech and more affiliative statements than the task-oriented one.—*R. S. Davidson.*

4913. Winitz, Harris, & Bellerose, Betty. (U. Kansas) Sound discrimination as a function of pretraining conditions. *J. speech hear. Res.*, 1962, 5(4), 340-348.—Discrimination learning of 72 4th-grade children was studied as a function of 3 pretraining conditions: correct reinforcement, incorrect reinforcement, and no reinforcement. The learning involved a 2-bar successive discrimination of the [ʒa] and [çə] sounds. No evidence was obtained that discrimination was reduced following incorrect reinforcement. Ss assigned to the pretraining condition of incorrect reinforcement continued to utter the incorrect response when it was reinforced. Learning models appear to have implications for both teaching and understanding of articulatory modification.—*M. F. Palmer.*

Mass Communication

4914. Wertham, Fredric. (Queens Hosp. Cent., N. Y.) The scientific study of mass media effects. *Amer. J. Psychiat.*, 1962, 119(4), 306-311.—A number of recent books on the effect of mass media violence on children are criticized for concluding that there are no harmful consequences. From clinical evidence on over 200 cases, the author argues that "our younger generation is getting more and more teledirected," a prediction he says he made 15 years ago.—*N. H. Pronko.*

ESTHETICS

4915. Bloomsiter, Paul C., & Creel, Warren. (State University Coll., Albany, N. Y.) Ratio relationships in melody. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. 1), 1276-1277.—"Forced choice between the tempered scale and one of the just scales in an atypical melody does not provide an adequate test of tuning preferences. Experiments by other methods indicate that small whole number ratios do operate in melody."—*A. M. Small, Jr.*

4916. Butch, Charles, & Fischer, Hardi. (Zürich, Switzerland) Der "Music Preference Test" im entwicklungspsychologischen Verlauf. [The Music Preference Test in developmental psychology sequence.] *Schweiz. Z. Psychol. Anwend.*, 1961, 20(4), 317-328.—Cattell's Music Preference Test of Personality was administered to 917 Swiss youths between ages 10 and 21; 528 were male and 389 were female. Results are presented in graphic form according to age, sex, and personality factors. Conclusions are drawn regarding: (a) the variations of factor loadings over the period studied; (b) the degree of agreement between the meaning of factors, as postulated by Cattell, and prior statements of developmental psychology; and (c) the usefulness of music factors, including their definitions, for local conditions in Switzerland. (English summary)—*J. W. House.*

4917. Churcher, B. G. (Bowden, Cheshire, England) Calculation of loudness levels for musical sounds. *J. Acoust. Soc. Amer.*, 1962, 34(10), 1634-1642.—"The application to organ tones or other sustained musical sounds of the Stevens and the Zwicker methods for loudness-level calculation from observed sound spectra is examined. It is found that both

methods, although developed for dealing with noise of the continuous spectrum type, are applicable to organ tones, a particular class of discrete component sound, subject to the use in both methods of accepted equal-loudness contours."—*A. M. Small, Jr.*

4918. Kepes, Gyorgy. (Ed.) The visual arts today. *Daedalus*, 1960, 89(1), 1-268.—A special issue which contains personal statements by artists on their work and motives for working, and commentaries by philosophers, art historians and critics, and psychologists on the status of the visual arts and on various practical and esthetic issues. The commentaries of most interest to students of the psychology of aesthetics are: Paul Weiss, "Organic Form: Scientific and Aesthetic Aspects"; Andreas Speiser, "Symmetry in Science and Art"; Rudolf Wittower, "The Changing Concept of Proportion"; J. J. Gibson, "Pictures, Perspective, and Perception"; and E. H. Gombrich, "On Physiognomic Perception."—*K. E. Davis.*

4919. Kolb, H. (Psychological Inst., U. Würzburg, Germany) Dimensionen der Beurteilung von Illustrierten-Titelbildern. [Dimensions of judgments from illustrated and captioned pictures.] *Psychol. u. Praxis*, 1962, 6(3), 97-107.—30 women between ages 18 and 30 ranked captioned illustrated pictures under previously determined adjectival descriptions. Correlations ranged from .17 to .70 between judges' rankings of the 13 descriptions. Rank order correlations between the adjectival descriptions were also calculated. Thurstone's multiple-factor analysis identified (a) greatness and glamour, (b) amusing and pleasant, (c) commonplace, (d) elegant, and (e) nature loving, as important factors.—*H. Roemmich.*

4920. Meyer, Max F. (5308 Danville, Springfield, Va.) Listeners can be seduced to perceive the paradoxical ratio 51:87 as either one or another truly melodic interval. *J. Acoust. Soc. Amer.*, 1962, 34(9, Pt. 1), 1277.—"The ratio 51:87 (1.706), musically paradoxical, is found to be interpreted as 4:7 when surrounded by the terms 63, 76, and 101; and interpreted as 3:5 when surrounded by the terms 34 and 68."—*A. M. Small, Jr.*

4921. Munro, Thomas. What causes creative epochs in the arts? *J. Aesthet. art Crit.*, 1962, 21(1), 35-48.—The author concludes that there must be: "(a) innately potential geniuses; (b) materials and conditions adequate to implement and channel their voluntary energies into some artistic medium; (c) institutions capable of giving them technical training and some knowledge of their own artistic heritage; and (d) other persons with taste, power, and will to appreciate artistic merit and help to give it wider recognition."—*P. R. Farnsworth.*

4922. Stuart, I. R., & Eliasberg, W. G. (Hunter Coll.) Personality structures which reject the human form in art: An exploratory study of cross-cultural perceptions of the nude. *J. soc. Psychol.*, 1962, 57(2), 383-398.—In continuing to validate a series of postulates as to what constitutes pornography in visual or literary art today, with the purpose of constructing a valid instrument for making judgments, a cross-cultural study of the effects of a Latin culture on the selective perceptions of 148 male and female Ss attending the University of Havana was made. The correlation between rigidity

of personality structure as indicated on their F scale scores, and their judgments of a series of nudes accepted as works of great art, was not significant. This contrasted with the results of a study of American students. Reasons given for making a judgment of a picture were similar to American Ss. Categories defining pornography in literature and visual art were again validated.—*Author abstract.*

PERSONALITY & ABILITIES

4923. Cardno, J. A. (U. Tasmania) **Personality and self: Lewes and James.** *Psychol. Rec.*, 1962, 12(1), 45-52.—In the 2 standard bibliographies dealing with 19th-century writings on personality and self, W. James is mentioned and George A. Lewes is not. James has been renowned and Lewes almost forgotten. A long overdue reevaluation of Lewes' work, using Allport's definition of personality as a point of departure, points to a distinct underevaluation of Lewes. This view is seen as substantiated "in so far as structured impression and appraisal of a literary kind will admit."—*R. J. Seidel.*

4924. Humphreys, Lloyd G. (U. Illinois) **The organization of human abilities.** *Amer. Psychologist*, 1962, 17(7), 475-483.—There are "two unfortunate tendencies in recent work on human abilities: the proliferation of factors and the tendency to think of only the first-order factors as the primary ones. An alternative model is to place factors in hierarchical order as advocated by the British psychometricians, especially Vernon. The application of the hierarchical model to a logical hierarchy of possible tests of mechanical information is presented, some hypothetical correlations are factored in several orders, and the Schmid-Leiman transformation is used to convert the factors back into a single orthogonal matrix manifesting the hierarchical principle. Facet analysis would enable one to define a population of tests . . . [and] helps restate the need for homogeneity in a test."—*S. J. Lachman.*

4925. Kelly, G. A. (Ohio State U.) **The abstraction of human processes.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 220-229.—"Whatever channels of movement are expressed in a person's life, no matter how subtly, these are his personal constructs." They define the matrix to use in understanding personality.—*B. T. Jensen.*

4926. Koppe, W. A. **Social resources for character growth: A research progress report.** *Charact. Potential*, 1962, 1(1), 29-44.—Longitudinal research with parents and children who are making a creative effort to learn character and religious attitudes revealed that children actively search among their social resources for cues that contribute to their decisions and purposes. 5 general propositions concerning the individual's perception and use of his social resources emerged from the data. The advantages of longitudinal research based on open-ended responses of children, parents, and teachers are discussed and illustrations of some of the observations are given. The values of this approach for religious and character education are indicated.—*W. T. Penrod.*

4927. Kuppuswamy, B. **Bhagavad-Gita and mental health.** *Pratibha*, 1959, 2(1), 107-111.—There is a shift in the interpretation of Gita from renunciation to action. According to Gita the integrated personality is one who can find comfort in himself, and this is possible only when emotional stability is achieved. The characteristics of an integrated personality are: finding comfort for oneself in oneself; untroubled in sorrows and not longing for joys; freedom from desire, fear, and wrath; and removal of the motive of fruit-of-action. Self-control is given great importance.—*U. Pareek.*

4928. Ligon, E. M. **The tools for insight.** *Charact. Potential*, 1962, 1(1), 3-28.—27 years of research in character development have led to the formulation of 6 concepts—3 of personality and 3 of research design—which have proven to be fruitful in the search for the moral and spiritual potential of man. These concepts are related to the design of a family research workshop.—*W. T. Penrod.*

4929. Rao, B. S. Sridhara Rama, & Rao, S. K. Ramachandra. **The problem of individual differences.** *Pratibha*, 1959, 2(1), 124-125.—"The nature and extent of individual variation within the group and the significance of individual differences need to be unraveled, and the twin disciplines of psychodynamics and psychogenetics provide the hope in this direction." The findings of psychogenetics indicate need for intensive studies on personality development and its breakdown in various types of cultural environments: the hierarchy of integrative processes and the systems of stress in culturally influenced human variation.—*U. Pareek.*

4930. Simoes, Ruth Scheeffer. **Teoria de Carl Rogers sobre a personalidade e o comportamento.** [Carl Rogers theory of personality and behavior.] *Arqu. Brasil. Psicotec.*, 1960, 12(3), 65-70.

4931. Skawran, P. R. **Hayman's concept of primary and secondary function as a means of classifying temperaments.** *Psychol. Afr.*, 1962, 9, 119-132.—The concept of primary and secondary function as a means of classifying temperament is discussed. Heymans' concept is charted by personality, character, temperament, intellect, attention, and effect on the emotions. "A cognitive function cannot be accepted as basic factor for the classification of temperaments." It is necessary to arrive at a theory of temperaments. (32 ref.)—*J. L. Walker.*

4932. Wishner, J. (U. Pennsylvania) **Efficiency: Concept and measurement.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research.* (see 37: 4117). Pp. 161-187.—Efficiency is defined as a function of focused to diffuse behavior. Several relevant experiments are described. Efficiency could be a useful concept in personality study. (37 ref.)—*B. T. Jensen.*

NEW TESTS & TEST CONSTRUCTION

4933. Ammons, R. B., & Ammons, C. H. (Psychological Test Specialists, Missoula, Mont.) **Quick Test.** Missoula, Mont.: Psychological Test Specialists, 1962. \$8.00.—A very brief, standardized, individual intelligence test in 3 forms. It takes 10 minutes or less to administer, covers a range from 2 years to superior-adult levels, and can be used with

nonreaders and the physically handicapped as well as normals.—*E. L. Borrowman.*

4934. **Hanley, Charles.** (Michigan State U.) The "difficulty" of a personality inventory item. *Educ. psychol. Measmt.*, 1962, 22(3), 577-584.—MMPI items were reordered into a 5-page booklet. The 1st page contained instructions and 11 items. The other 4 pages were randomly assembled containing short items, standard-long items, short-controversial, or long-controversial items. The protocols of 72 women psychology students were used. By using response latency and posttest confidence judgments as indices of difficulty, data were obtained showing controversial items to be more difficult than standard items. Items answered nearly equally true or false by the standardization sample were considered to be controversial.—*W. Coleman.*

4935. **Longano, Alfred A., Cannon, L. Dennis, & Olson, Howard C.** SPANCON: Span of control. 1. Development of a knowledge-free span of control test. *HumRRO res. Memo.*, 1962, Subtask Spancon II, Task 11-28. ii, 51 p.—Apparatus and methods were developed to determine capacity for dealing with "the volume and character of the information which make up a particular situation." Appendices present construction and operation of the test, test manual, and test items grouped by factors.—*R. Tyson.*

4936. **Myers, Charles T.** (Educational Testing Service) The relationship between item difficulty and test validity and reliability. *Educ. psychol. Measmt.*, 1962, 22(3), 565-571.—Using items of relatively homogeneous difficulty did not yield higher validity coefficients than those obtained from tests with a greater range of item difficulty. Mean item difficulty was about the same. Tests containing more uniform items (in difficulty) were found to be more reliable although they were not homogeneous factorially.—*W. Coleman.*

4937. **Owens, William A.** (Purdue U.) Retest consistency and the writing of life history items: A first step. *J. appl. Psychol.*, 1962, 46(5), 329-331.—Retest consistency was employed as a criterion for the evaluation of life history items, and rules for item writing or selection such that this criterion may be better satisfied were suggested. The method employed required: an inspection of consistent and inconsistent items with a view to deriving rules, and the "blind" sorting of these items in accordance with a given rule by 5 independent judges to determine the coincidence of rule conformity with retest consistency. 4 rules satisfied a statistical criterion of significant association. These deal with brevity, with the definition of options, with the undesirability of "forcing," and with the pleasant or unpleasant implications of a response for the respondent.—*Journal abstract.*

4938. **Roberts, A. O. H.** The maximum reliability of a multiple-choice test. *Psychol. Afr.*, 1962, 9, 286-293.—"Starting with Horst's equation giving the maximum possible correlation between two multiple-choice tests, equations were derived which give the maximum possible reliability for a multiple-choice test with various distributions of difficulties. These equations reflect the dependence of reliability upon (1) average difficulty of items, (2) number of choices, and (3) length of test. In addition, a theoretical basis was established for Remmer's empiri-

cally-based observation that the increase in reliability due to an increase in the number of choices can be predicted fairly accurately, using the Spearman-Brown formula."—*J. L. Walker.*

4939. **Sastry, M. N. C., & Kasturi, H. Y.** (All-India Inst. Mental Health) Change of mental set in normals and mental patients. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 70-77.—A simple arithmetic test consisting of 2 parts of 100 items each was constructed. Each part contained 25 items on addition, 25 on subtraction, 25 on multiplication, and 25 on division. Each item of one part had a corresponding item in the other part in terms of the nature of the problem and the difficulty level. In the 1st part, the items were arranged systematically, a column for each 1 of the 4 fundamental mathematical operations. In the 2nd part, the arrangement of the items was done on a random basis. The 2 parts were administered to 25 normals and 24 patients.—*J. Di-Giovanni.*

4940. **Skawran, R. F.** The Willemse Board as a personality test. *Psychol. Afr.*, 1962, 9, 72-85.—The Willemse Board test is described together with its administration. It is believed to measure personal insecurity, a factor which is detrimental to success in flying. This factor was studied in relation to the test with 2 groups of pupil pilots ($N = 52$ and 50). Further research is needed but the test measures personality qualities "to an encouraging degree." It is not interrelated with other pupil pilot selection tests. Photographs are presented.—*J. L. Walker.*

TEST STANDARDIZATION & EVALUATION

4941. **Ammons, R. B., & Ammons, C. H.** (Montana State U.) The Quick Test (QT): Provisional manual. *Psychol. Rep.*, 1962, 11(1), 111-161.—"A detailed account is given of the development, standardization, and evaluation of The Quick Test, a brief individual intelligence test based on perceptual-verbal performance. Three single forms . . . cover abilities from the two-year level to the superior-adult level. Three to ten minutes are required to administer the QT. . . . Standardization was based on the responses of 458 children and adults, a sample controlled on a simultaneous quota basis for age, sex, educational level and own, or father's occupation. Single forms and combination forms . . . were found to be highly reliable (.66 to .95). These estimates were corroborated in several independent studies ($N = 111$), as were validity estimates (.77 to .96, correlations with the revised Stanford-Binet and the Wechslers). Ma, IQ, and percentile norms are included as well as a discussion of practical problems . . . and ideas for further research."—*B. J. House.*

4942. **Ferdinand, W., & Müller, F.** (Morsbach-Weg 21, Düsseldorf-Gerresheim, Germany) Der Intelligenz-Struktur-Test im 8. Volksschuljahr. [The Intelligence-Structure Test for eighth graders.] *Z. exp. angew. Psychol.*, 1962, 9(2), 176-189.—570 boys and girls were tested during their last year of public school. Besides establishing norms for this age level the testing demonstrated that more pupils were capable of continuing secondary schooling than were recommended by teachers.—*W. J. Koppitz.*

4943. **Keller, E. Duwayne, & Rowley, Vinton N.** (State U. Iowa) Junior high school and additional elementary school normative data for the

Children's Manifest Anxiety scale. *Child Developm.*, 1962, 33(3), 675-681.—The present study reports CMA scale normative data for junior high and additional elementary school white children. Junior high girls scored higher on the A scale than junior high boys, but no difference was found between elementary boys' and girls' scores. No overall difference between elementary and junior high children's A scale means was found. No difference was found between L-scale means of junior high boys and girls nor between elementary boys and girls. Elementary children were found to score higher on the L scale than junior high children. Correlations between the A and L scales were not significant.—*Author abstract.*

4944. Matthews, Charles G., Guertin, Wilson H., & Reitan, Ralph M. (Fort Wayne State School) **Wechsler-Bellevue subtest mean rank orders in diverse diagnostic groups.** *Psychol. Rep.*, 1962, 11(1), 3-9.—"Rank difference coefficients of correlation were computed between Wechsler-Bellevue subtest rank orders in 18 diagnostic groups including retardates, several categories of cerebral damage, and various neurotic and psychotic disorders. The resulting matrix of 153 coefficients was factor analyzed using Thurstone's centroid method. Most of the systematic variance was accounted for in two major factors"—verbal impairment, associated with groups with long standing disabilities, and performance impairment, associated with groups whose impairment appeared after an extended period of relatively normal growth and development. "Limitations and implications of the study were discussed in relation to previous Wechsler-Bellevue subtest pattern investigations."—*B. J. House.*

4945. Osborne, R. Travis, & Allen, Jerry. (U. Georgia) **Validity of short forms of the WISC for mental retardates.** *Psychol. Rep.*, 1962, 11(1), 167-170.—"The present study was undertaken to determine the WISC triads which would yield the smallest error in predicting Full Scale IQs for white mental retardates. The WISC was administered to a base group of 240 mental retardates. Full Scale-triad correlation coefficients were computed for all possible three-test combinations. The experiment was replicated with a comparable group of 50 Ss. Eight WISC triads which were found to hold up well for both the base and the validating groups are offered as valid predictors of Full Scale WISC IQs."—*B. J. House.*

4946. Phatak, Pramila. **Calculations of norms on Phatak's Draw-a-Man Scale for Indian children in Gujarat.** *J. Maharajah Sayajirao U. Baroda*, 1962, 11(1-2), 131-138.—Norms based on the scoring of 8000 drawings of children of 6-10 years are presented including means and SDs for 4 age groups and 5 educational levels. 75 critical ratios of the differences in means are given, out of which 53 were found to be significant.—*U. Pareek.*

4947. Ray-Chowdhury, K. (Muslim U., Aligarh, India) **Allport-Vernon-Lindzey Study of Values (Old Form) in Indian situation: II. Reliability and item-analysis.** *Indian psychol. Bull.*, 1959, 4, 7-15.—An experimental version of the Allport-Vernon Study of Values (1951 edition) was used in an investigation carried out in 1956-57 on 518 graduate men and women of Aligarh. The Kuder-Richardson reliability figures were as follows: Theo-

retical = .92; Economic = .93; Aesthetic = .97; Social = .94; Political = .91; Religious = .98. An item analysis suggested modifications for Indian graduates of 9 items in Theoretical, 9 in Economic, 11 in Aesthetic, 5 in Social, 5 in Political, and 7 in Religious categories.—*A. K. Ganguly & S. L. Mishra.*

4948. Ray-Chowdhury, K. (Muslim U., Aligarh, India) **Allport-Vernon-Lindzey Study of Values (Old Form) in Indian situation: III. Occupational group differences and norms in values at the college level.** *Indian psychol. Bull.*, 1959, 4, 20-29.—Norms for several occupational groups at the college level have been prepared for use in Indian situations. Several occupational group differences have been found to be significant in all the 6 categories of the Study of Values.—*S. L. Mishra & M. O. Husain.*

4949. Sax, Gilbert. (U. Hawaii) **Theoretically derived chance scores and their normative equivalents on a selected number of standardized tests.** *Educ. psychol. Measmt.*, 1962, 22(3), 573-576.—On some standardized tests, chance scores alone may place a child at a spuriously high normative equivalent. An example is given of an 11-year-old with a raw score equal to chance placing at the 80th percentile for his age group and with an IQ of 116 corresponding to the raw score. A table is presented for 8 widely used tests showing the chance scores and their normative equivalents. Test publishers, authors, and users need to be more cognizant of the role that chance scores play in test interpretation.—*W. Coleman.*

4950. Tesi, G., & Bouterline Young, H. **A standardization of Raven's Progressive Matrices 1938 (Revised Order, 1956).** *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(5), 456-464.—Italian standardization in centiles and stanines of Raven's Progressive Matrices with some discussion of differences between Italian and English samples as well as between boys and girls.—*L. L'Abate.*

INTELLIGENCE & CREATIVITY

4951. Allen, Robert M. (U. Miami) **The real question in digit span performance.** *Psychol. Rep.*, 1962, 11(1), 218.—Discussion of a study by Craddick and Grossman (see 37: 4953).—*B. J. House.*

4952. Barratt, Ernest S., Clark, Marjorie, & Lipton, James. (Texas Christian U.) **Critical flicker frequency in relation to Cattell's Culture Fair Intelligence score.** *Amer. J. Psychol.*, 1962, 75(2), 324-325.—None of the studies on critical flicker frequency (CFF) and intelligence reviewed up to 1956 employed measures of intelligence that were culturally free. Logically the nearer one gets to such measures, the more the variances of the tests will reflect neuro-physiological processes involving sensory input-systems. 42 5th-grade children were given both the Cattell test and a CFF test. The 2 were significantly related, the correlation being 0.43. For the same group, the correlation between CFF and total scores for the children's Wechsler test was -0.09.—*R. D. Nance.*

4953. Craddick, Ray A. (New Mexico State U.) **Reply to Allen on the real question in digit span performance.** *Psychol. Rep.*, 1962, 11(1), 238.—A

discussion of criticism by Allen (see 37: 4951) of a study by Craddick and Grossman.—*B. J. House.*

4954. Craddick, Ray A., & Grossmann, Klaus. (New Mexico State U.) Effects of visual distraction upon performance on the WAIS Digit Span. *Psychol. Rep.*, 1962, 10, 642.—No detrimental effect on Digit Span scores of undergraduates was observed as a result of distraction induced by E's looking directly into the eyes of S as he responded.—*B. J. House.*

4955. Galton, Francis. Hereditary genius: An inquiry into its laws and consequences. New York: Meridian Books, 1962. 446 p. \$1.45 (paper).—A paperback edition of Galton's work. The text is that of the 2nd edition, published in 1892.—*E. L. Borrowman.*

4956. Higgins J. V., Reed, Elizabeth W., & Reed, S. C. (U. Minnesota) Intelligence and family size: A paradox resolved. *Eugen. Quart.*, 1962, 9 (2), 84-90.—A study of 1016 families in which IQ values for both parents and one or more of their children were available, as well as for the unmarried or childless siblings of the parents. "The inclusion of these siblings allowed us to resolve the old paradox presented by the failure of the general intelligence level to decline in accord with the large negative correlation (-0.30) between intelligence and the number of children in the family." The solution lies in the fact that when nonreproducing siblings of the parents are included the negative correlation disappears. This higher reproductive rate of parents in the lower IQ rates is offset by the larger proportion of their siblings who never marry or fail to have children.—*S. G. Vandenberg.*

4957. Liddicoat, R., & Roberts, A. O. H. Interim standardization of the South African version of the Wechsler-Bellevue Adult Intelligence test. *Psychol. Afr.*, 1962, 9, 273-285.—An adaptation of the Wechsler-Bellevue for use in South Africa was begun in 1947. Interim norms for age groups from 18 to 44 have been developed. Testing will continue until 2948 protocols are available. The possible use of the test for clinical diagnostic purposes will then be investigated.—*J. L. Walker.*

4958. Mackinnon, D. W. (U. California) The personality correlates of creativity: A study of American architects. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 11-39.—40 of 64 invited architects participated in a weekend "intensive assessment." Ratings on creativity were compared with numerous personality assessments.—*B. T. Jensen.*

4959. MacKinnon, Donald W. (U. California, Berkeley) The nature and nurture of creative talent. *Amer. Psychologist*, 1962, 17(7), 484-495.—"Creativity . . . is a process extended in time and characterized by originality, adaptiveness, and realization." Except for mathematicians "where there is a low positive correlation between intelligence and the level of creativeness, we have found within our creative samples essentially zero relationship between the two variables." A research study of the characteristics and background of creative architects is extensively discussed. Implications of the nature of creative talent for the nurturing of it in school and college

through the processes of education are considered.—*S. J. Lachman.*

4960. McLeod, H. N., & Rubin J. (Toronto Psychiatric Hosp., Canada) Correlation between Raven Progressive Matrices and the WAIS. *J. consult. Psychol.*, 1962, 26(2), 190-191.—Correlation is slightly higher for males and proportional to level of intelligence. Regression allows prediction of Full Scale score within 10 points in 73% of cases.—*E. R. Oetting.*

4961. Mednick, S. A., & Mednick, M. T. (U. Michigan) A theory and test of creative thought. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 40-47.—Defining creativity as associating information, 3 ways of creating are described: serendipity, through noting similarity, and through making remote associations. A "Remote Associates Test" requiring the examinee to find terms to relate triads of work is described, and some relationships with other variables are presented.—*B. T. Jensen.*

4962. Ohira, Katsuma. (Kanazawa U.) [A study on the intelligence and the language proficiency of city and farm-village children.] *Jap. J. educ. Psychol.*, 1962, 10(2), 107-112.—"The enquiry suggests that a group verbal intelligence test may not give an accurate T-score assessment for farm-village children, unless their inferiority in language proficiency is taken into account."—*C. T. Morgan.*

4963. Orme, J. E. Intelligence and season of birth. *Brit. J. med. Psychol.*, 1962, 35(3), 233-234.—"In short, birth in summer and autumn is likely to go with greater ability than in winter and spring. It is suggested that more study should be made of this phenomenon which might lead to important findings with regard to individual variations in intelligence." The conclusion is based on 148 Ss ranging in IQ from 40 to 69, studied with the Coloured Progressive Matrices Test.—*C. L. Winder.*

4964. Ray-Chowdhury, K. (Muslim U., Aligarh, India) Imagery and performance tests of intelligence. *Indian psychol. Bull.*, 1957, 2, 25-30.—A study of the relation between individuals' imagery scores and their scores on performance tests. Barratt's technique of assessing imagery strength of various modalities was used to prepare a 5-point imagery questionnaire measuring 4 dimensions or areas of visualisation. 50 Ss were used and the questionnaire was given to them after their performance on Kohs Blocks, Passalong, and Dearhorn Form Board. The correlations between imagery scores and performance scores was significant beyond the .01 level, suggesting the usefulness of Barratt's technique under specified conditions.—*A. K. Ganguly & S. L. Mishra.*

4965. Riegel, R. M., & Riegel, K. F. (U. Michigan) A comparison and reinterpretation of factor structures of the W-B, the WAIS, and the Hawie on aged persons. *J. consult. Psychol.*, 1962, 26(1), 31-37.—Using transformation analysis, no differences in factor structure are apparent for different tests, age, or American-German populations.—*E. R. Oetting.*

4966. Samejima, F. (Nippon Research Cent.) [Theoretical correspondence between Lord's theory and Thrustone's theory.] *Jap. J. Psychol.*, 1962, 33

(2), 84-97.—The purpose of the study was to investigate Thurstone's theory of absolute scale in intelligence measurement from the standpoint of Lord's theory of test scores. It is concluded that the "modified absolute scale theory" proposed by Thurstone can be substituted for Lord's theory both in estimating the mean and standard deviation of an examinee group in mental ability and in obtaining an adequate substitute for the ability score, as far as tests consisting of items of high correlation with the ability measurement are concerned.—*A. Barclay.*

4967. Sandven, Johs. *Det teoretiske og metodiske grunnlag for modenhetssprøving.* [The theoretical and methodological basis for maturity testing.] *Pedag. Forsk.*, 1962, No. 3, 147-168.—The Norwegian maturity tests developed for children of school age and adolescents are described. The concept of maturity is considered superior to that of "intelligence" since, unlike the latter term, it generally does not carry the many undesirable connotations of something static, something that a person has or has not in a certain quantity, something that cannot be changed, etc. The tests mentioned (consisting of 6 series, 2 for ages 6-8, 2 for ages 9-11, and 2 for age 12 and up) are intended to depict the intellectual functions in the age ranges concerned, and within this frame to get as far down as possible to the ability factors that are basically characteristic of the person, with special emphasis on those that are important in school. The tests cover the memory function, verbal ability, space and form perception, reasoning ability, and quantitative ability. (English summary)—*L. Goldberger.*

4968. Sarason, I. G., & Minard, J. (U. Washington) *Test anxiety, experimental instructions, and the Wechsler Adult Intelligence Scale.* *J. educ. Psychol.*, 1962, 53(6), 299-302.—4 subscales of the WAIS were administered to 96 college students in an experiment in which there were 3 variables: (a) Ss' Test Anxiety Scale scores, (b) sex of S, and (c) preliminary conditions (achievement-orienting and neutral instructions). On the Vocabulary, Block Design, and Comprehension subscales low test anxious Ss were superior to high test anxious Ss. For Comprehension, this effect was largely attributable to the effects of instructions. High and low test anxious Ss did not differ on Digit Symbol, but a Test Anxiety X Sex X Instructions interaction was obtained for this subscale. The results were interpreted as indicating the relevance to performance of the 3 variables studied as well as the importance of the task variable in research and anxiety.—*Journal abstract.*

4969. Sperber, Z., & Adlerstein, A. M. (Children's Hosp., Philadelphia, Pa.) *The accuracy of clinical psychologists' estimates of interviewees' intelligence.* *J. consult. Psychol.*, 1961, 25(6), 521-524.—3 psychologists estimated IQs of mothers from transcripts of psychiatrists interviews, 2 from tape recordings. Mean *r* equals .70 with WAIS. More confident judges were more accurate.—*E. R. Oetting.*

4970. Thompson, Jack M., & Finley, Carmen J. (Sonoma County Schools) *The validation of an abbreviated Wechsler intelligence scale for children for use with the educable mentally retarded.* *Educ. psychol. Measmt.*, 1962, 22(3), 539-542.—WISC protocols for 173 educable mentally retarded

children were used to compute an IQ from weighted subtest scores. The predicted IQ scores agreed closely with the actual Full Scale scores. The authors conclude that the abbreviated WISC may be used as a valid predictor of the Full Scale IQ when educable mentally retarded children are to be tested.—*W. Coleman.*

4971. Torrance, E. P. (U. Minnesota) *Must creative development be left to chance?* *Gifted Child Quart.*, 1962, 6(2), 41-44.—Creative development, the author maintains, need not decline at Grade 4 as is commonly observed. Rather, certain teaching techniques increase original thinking. Evidence adduced from investigations in Samoa link decline in creativity to the low value placed on adventurousness and curiosity and the high value placed on promptness and competitiveness. Associated with cultural discontinuities, however, is a rise in creativity. Rapid technological changes generate research in and teaching of creative problem solving.—*N. M. Chansky.*

4972. Tripathi, T. P. *A factorial study of the differentiation of abilities.* *Shiksha*, 1962, 14(3), 122-133.—8 general ability tests were administered to boys of 13+. Results showed that 4 factors could be isolated: general mental ability, verbal ability, spatial ability, and number ability, in that order of importance. Educational implications are discussed.—*U. Pareek.*

4973. Vernon, P. E. (U. London) *Intellectual development in non-technological societies.* In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 94-105.—14,000 candidates for secondary school placement in the British West Indies were given the Moray House tests: smaller samples had other tests. It is estimated that the 95th percentile is at IQ 100. Environmental factors are apparently related.—*B. T. Jensen.*

PERSONALITY MEASUREMENT

4974. Andrey, Bernard. *Analyse d'éléments de la personnalité à travers un test de niveau verbal.* [Analysis of personality elements through a test of verbal level.] *Psychol. Franc.*, 1962, 7(2), 111-125.—The uses of intelligence and aptitude tests for the purpose of obtaining additional information are discussed. 4 cases are presented.—*C. J. Adkins.*

4975. Barton, Allen. (Columbia U.) *Measuring the values of individuals.* *Relig. Educ.*, 1962, 57(4, Res. Suppl.) 62-97.—The identification and limitation of value-concepts used in social science research, and procedures of quantifying variations in values by means of interviews, rating scales, tests, and other related methods are discussed.—*S. A. Walters.*

4976. Cairns, R. B., & Lewis M. (Indiana U.) *Dependency and the reinforcement value of a verbal stimulus.* *J. consult. Psychol.*, 1962, 26(1), 1-8.—3 measures of dependency.—The Edwards Personal Preference Schedule, Leary's Interpersonal Checklist, and a behavioural measure—were moderately related. Ss with low scores on the inventories judged the verbal reinforcement stimulus as negative or neutral. The low group shows a significant decrement when verbally reinforced for producing aggressive sentences, no differences for producing dependency words.—*E. R. Oetting.*

4977. Cattell, R. B. (U. Illinois) **Personality assessment based upon functionally unitary personality traits, factor analytically demonstrated.** In G. Neilson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology, Vol. 2. Personality research* (see 37: 4117). Pp. 198-219.—Applied psychology must be based on proper advances in pure science. Factor analysis indicates more meaningful "source traits" than does an approach comparing variable with criterion.—B. T. Jensen.

4978. Crovitz, H. F. (VA Hosp., Durham, N. C.) **On direction in drawing a person.** *J. consult. Psychol.*, 1962, 26(2), 196.—". . . the data support the hypothesis that drawing directionality is related to the hand used in drawing." S's reports suggest that wrist flexion in drawing the forehead may be critical.—E. R. Oetting.

4979. Ekman, G. (U. Stockholm, Sweden) **Measurement of moral judgment: A comparison of scaling methods.** *Percept. mot. Skills*, 1962, 15(1), 3-9.—Scales of moral judgment were obtained by (a) the indirect method of pair comparisons on the assumption of Thurstone's Case V, and (b) the direct method of ratio estimation. The logarithmic relationship found in previous studies was verified also for this subjective continuum.—W. H. Guertin.

4980. Goldfried, M. R., & McKenzie, J. D., Jr. (U. Buffalo) **Sex differences in the effect of item style on social desirability and frequency of endorsement.** *J. consult. Psychol.*, 1962, 26(2), 126-128.—Items written in 7 different styles are evaluated. Social desirability increased only with the Guilty style. Frequency of responding was lowered by the Trouble Controlling style for males and increased by the Like Most People and Tempted styles for females.—E. R. Oetting.

4981. Guilford, J. P., Christensen, P. R., Taaffe, G., & Wilson, R. C. (U. Southern Calif.) **Ratings should be scrutinized.** *Educ. psychol. Measmt.*, 1962, 22(3), 439-447.—5 supervisors rated 53 research scientists on 8 traits after receiving instruction. 11 cognitive test factors were correlated with ratings on 8 graphic scales. Only 14 of the 99 correlations were significant at the .05 level indicating "that trait ratings may often measure variables other than those it is intended that they measure or those it is believed that they measure."—W. Coleman.

4982. Gynther, M. D. (Washington U. Medical School) **Degree of agreement among three interpersonal system measures.** *J. consult. Psychol.*, 1962, 26(1), 107.—MMPI and sociometric data show no agreement; self-description and sociometric rating, and MMPI and self-rating, show agreement. "Our contradictory findings cast doubt on Leary's assertion [see 31: 2556] that these tests measure specified, distinct levels of behaviour."—E. R. Oetting.

4983. Kjeldergaard, Paul M. (Harvard U.) **Commonality scores under instructions to give opposites.** *Psychol. Rep.*, 1962, 11(1), 219-220.—114 graduate students "were given the Kent-Rosanoff word association test twice, first with the usual instructions and then with instructions to respond with an 'opposite' whenever appropriate." An increase in commonality scores was observed on the 2nd test. Results are compared with similar findings by Jenkins

when Ss are instructed to give "popular" responses.—B. J. House.

4984. Knehr, Edeltraut. **Konflikt-Gestaltung im Szenotest.** [Conflict formation in the Scene-Test.] Munich, Germany: Reinhardt, 1961. 17 cards, 94 p. DM 11 (cloth), DM 9 (paper).—The formation of conflicts as observed impressionistically by means of the Scene-Test is described.—J. C. Brengelmann.

4985. Kogan, W. S., & Fordyce, W. E. (VA Hosp., Seattle, Wash.) **The control of social desirability: A comparison of three different Q sorts and a check list, all composed of the same items.** *J. consult. Psychol.*, 1962, 26(1), 26-30.—A theoretical discussion of social desirability and personality inventories. 3 variations of Q sort and a check list, show practical equivalence in variable scores and in control of SD. The check list is somewhat more susceptible to variations.—E. R. Oetting.

4986. Lessler, K. (Michigan State U.) **Sexual symbols, structured and unstructured.** *J. consult. Psychol.*, 1962, 26(1), 44-49.—Both structured and unstructured (dark and rough vs. light and soft) symbols are successfully identified by the adolescent and college groups. Pre-adolescents identify only structured symbols. Females are more consistent with unstructured symbols. A discussion of multiple determination is presented.—E. R. Oetting.

4987. Linton, H. B., Epstein, L., & Hartford, H. (New York U.) **Personality and perceptual correlates of primary beginning strokes in handwriting.** *Percept. mot. Skills*, 1962, 15(1), 159-170.—Primary beginning strokes were defined as voluntary elaborations of the essential letter form, while secondary beginning strokes were described as the retention of patterns learned in the first years of school. Ss using many primary beginning strokes were similar to Ss using many secondary beginning strokes in their tendency toward authoritarian attitudes. But while users of secondary beginning strokes had been found to be passive, inadequate, and generally immature, users of primary beginning strokes were found to be actively seeking external stimulation and ways of asserting themselves in a framework of other-directedness and conformity.—W. H. Guertin.

4988. Loprieno, M. **Caratteri della visibilità delle scelte interpersonali.** [Characteristics of visibility in interpersonal choices.] *Riv. Psicol. soc.*, 1962, 29(1), 3-11.—Coefficients of correlation between sociability, popularity, and self-esteem are discussed from the viewpoint of interpersonal visibility.—L. L'Abate.

4989. Mogar, R. E. (Pennsylvania State U.) **Anxiety indices in human figure drawings: A replication and extension.** *J. consult. Psychol.*, 1962, 26(1), 108.—(See 36: 5622) Draw-A-Person anxiety indicators are significantly related to Rorschach Content scores. Neither is related to Manifest Anxiety.—E. R. Oetting.

4990. Nichols, R. C., & Strumpfer, D. J. W. (Purdue U.) **A factor analysis of Draw-a-Person Test scores.** *J. consult. Psychol.*, 1962, 26(2), 156-161.—Factor analysis of 2 groups, male college students and VA patients, shows a very large factor accounting for most of the variance. The factor is interpreted as overall quality of drawing and is unrelated to gross adjustment of the VA patients.

Smaller factors are defined and discussed.—E. R. Oetting.

4991. Ray-Chowdhury, K. (Muslim U., Aligarh, India) **Comparative study of American and Indian weight scores of Allport's Ascendancy-Submission Reaction Study.** *Indian psychol. Bull.*, 1958, 3, 45-46.—A study of product-moment correlations between the weighted scores obtained in America and those obtained by the author in an Indian situation. The correlations computed separately for men and for women were: men ($N=90$), $r=.893$; women ($N=30$), $r=.908$. The paper also reports no significant racial or national differences at the upper level of the Indian population on certain Anglo-American personality tests like the present one.—A. K. Ganguly & S. L. Mishra.

4992. Ryder, R. (U. Michigan) **Teaching reliable rating of a process variable.** *J. consult. Psychol.*, 1962, 26(1), 106.—A flash card method of training raters shows great improvement in ability to postdict criterion ratings.—E. R. Oetting.

4993. Sargent, S. Stansfeld, & Beardsley, Katharine Pease. (VA Hosp., Phoenix, Arizona) **Social roles and personality traits.** *Int. J. soc. Psychiat.*, 1960, 6(1-2), 66-70.—2 studies are reported. A modified version of the Allport Ascendancy-Submission test and a newly constructed version of an introversion-extroversion test were given to college women in introductory psychology classes. The results were subjected to an analysis of variance to assess the contribution of situational variables in ascendancy-submission and introversion-extroversion. Situational influences do operate significantly in these dimensions though a situational theory of social behavior is not supported.—C. T. Morgan.

4994. Scarborough, B. B. (Florida State U.) **Measurement of interest with pictures.** *Percept. mot. Skills*, 1962, 15(1), 122.—A statistical reanalysis is made of Young's prisoner's responses to the Pictorial Interest Inventory. The analysis is made by occupational groups to show that something other than chance accounts for the choices.—W. H. Guertin.

4995. Sonnemann, U., & Kernan, J. P. **Handwriting analysis: A valid selection tool?** *Personnel*, 1962, 39(6), 8-14.—In Europe, especially in West Germany, graphology is an accepted and widely used technique in personnel selection. In the United States there has been little enthusiasm for its use. The present paper is a report on the results obtained by 1 leading American company which successfully employed graphology.—V. S. Sexton.

4996. Stephenson, W. (U. Missouri) **Perspectives in psychology: XX. A note on the methodology of clinical explanation.** *Psychol. Rec.*, 1962, 12, 101-103.—Issue is taken with Meehl's position that actuarial prediction is better than clinical. An argument is presented that clinical research is concerned with explanation, not with prediction, as is the actuarial approach. Therefore, the methodologies of the two, clinical and actuarial, are incommensurate. Facts for the clinical approach are not actuarial, as Meehl intends, but are provided specially in terms of the single case. The Q-sort is given as an example of objective investigation of the single case. The data provided are "objective, reliable and remarkably valid."—R. J. Seidel.

4997. Sundararaj, N. **The discriminant function analysis: Its technique and use in psychology and psychiatry.** *Pratibha*, 1959, 2(1), 66-70.—Application of the technique in analysis of 80 Ss, 40 clinical and 40 nonclinical cases, shows that it is very useful both in establishing the groups and in classifying the individuals into 1 of such groups. The 2 groups studied were tested for attention, perception, motor behavior, and memory.—U. Pareek.

4998. Thomae, H. (U. Bonn, Germany) **Consistency and variability as fundamental problems in personality assessment.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 188-197.—Even "consistent" characteristics change. "Any assessment of personality . . . must include the assessment of degree, direction, and conditions of possible change." (28 ref.)—B. T. Jensen.

4999. Timaeus, E., & Wolf, S. (U. Göttingen, Germany) **Untersuchungen über den Rosenzweig P-F test.** [Research on the Rosenzweig P-F test.] *Z. exp. angew. Psychol.*, 1962, 9(2), 352-360.—The effect of previous nonstress activities was investigated with 4 groups of students. The task was card sorting. 1 group saw only aggressive statements on their cards, the 2nd only ascendancy statements, the 3rd submission statements. The control group sorted color names. No significant differences between the groups was found on the P-F test. This result is taken as evidence that the P-F test actually measures personality traits and is not affected by irrelevant variables.—W. J. Koppitz.

5000. Tsuru, Hiroshi. (U. Kobe) [A study of personality by means of discrepancy in mutual ratings by the members of a small group.] *Jap. J. educ. Psychol.*, 1962, 10(2), 78-89.—"By means of Brownfain's 25 items of self-concept, a group of seven university students (one male and six female) were assessed by making each of them rate against 5-point scales [yielding indexes of alienation, awareness, adaptation, and understanding]. . . . These indices obtained were then compared with the result of Y-G Test which was given to the same group as an external criterion, and the reliability of the devised indices were confirmed. The results indicated that these indices differentiated fairly well both interactions of the members of the group and their respective personality characteristics."—C. T. Morgan.

5001. Wahler, H. J., & Watson, L. S. (Ohio State U.) **A comparison of the Shipley-Hartford as a power test with the WAIS Verbal scale.** *J. consult. Psychol.*, 1962, 26(1), 105.—"When IQ is a minor variable in a decision complex and only a broad categorization is required for the circumstances, the findings support the position that a Shipley estimate can be sufficient."—E. R. Oetting.

5002. Zalkind, S. S., & Costello, T. W. (City Coll., New York) **Perception: Some recent research and implications for administration.** *Admin. Sci. Quart.*, 1962, 7(2), 218-235.—Recent work on interpersonal perception is examined and suggestions are presented concerning some implications for administrative practice. The authors note that there is no easy means to make objective what is essentially a subjective process. They feel that it is possible to indicate some guidelines and precautions to

use in this complex aspect of interpersonal relations. Understanding the process of interpersonal perception is one way of attempting to avoid gross errors in interpersonal judgments.—*V. S. Sexton.*

Inventories

5003. Anderson, C. C., & Traub, R. E. (U. Alberta) **A general factor of social desirability in the high school.** *Educ. psychol. Measmt.*, 1962, 22 (3), 463-471.—“A matrix of intercorrelations, based on social desirability judgments made by rural adolescents to 54 items associated with Murray's needs, was drawn up for six groups and the total sample. The seven matrices were factorized and rotated to oblique simple structure using the oblimax criterion. The first centroid factor became increasingly general with successive grade levels. . . . An analysis of the oblimax factors for Grade XII boys yielded six factors tentatively identified as Sociability, Socialized Anxiety inverted, Ascendancy, Control, Impulsivity, and Liking for Change.” A 2nd-order analysis yielded the 2 factors of extroversion and impulsivity. The factors extracted had little similarity to those obtained by Messick.—*W. Coleman.*

5004. Comrey, Andrew L. (U. California, Los Angeles) **A study of thirty-five personality dimensions.** *Educ. psychol. Measmt.*, 1962, 22 (3), 543-552.—From 35 personality variables that had been defined and included in a 216-item personality inventory, 19 factors were extracted. The most important factors were neuroticism, dependence, compulsiveness, friendliness, and hostility. The author feels further refinement is needed before he will have a useful inventory for research purposes.—*W. Coleman.*

5005. Braun, John R. (U. Bridgeport) **Differential susceptibility to faking of various Ghiselli Self-Description Inventory scales.** *Psychol. Rep.*, 1962, 10, 639-641.—“The effects of a number of different faking instructions on Ghiselli Self-Description Inventory scores were investigated using seven groups of university students as Ss. The various GSDI scales were found to vary greatly in their susceptibility to attempted faking. Of special interest was the supervisory qualities scale which withstood even the most specific faking set.”—*B. J. House.*

5006. Braun, John R. (U. Bridgeport) **Effects of a top management faking set on the Gordon Personal Inventory.** *Psychol. Rep.*, 1962, 10, 611-614.—20 students scored significantly higher on the GPI when instructed to fake answers so as to appear the best possible candidate for a top executive position than when given normal instructions. Factors influencing results of faking studies are discussed both in general and with respect to earlier studies with the Gordon Personal Profile.—*B. J. House.*

5007. Edwards, A. L., & Heathers, Louise B. (U. Wash.) **The first factor of the MMPI: Social desirability or ego strength?** *J. consult. Psychol.*, 1962, 26 (1), 99-100.—The 1st factor loading of the 31 MMPI scales correlates $-.93$ with the percentage of social desirability items on the scale.—*E. R. Oetting.*

5008. Edwards, Allen L., & Diers, Carol J. (U. Washington) **Social desirability and the factorial interpretation of the MMPI.** *Educ. psychol. Measmt.*, 1962, 22 (3), 501-509.—“First factor load-

ings on 58 MMPI scales were obtained under Standard (S) instructions, under instructions to give Social Desirable (SD) responses, and under instructions to give Social Undesirable (SUD) responses. The first factor loadings were stable over the three sets of instructions and highly correlated. The first factor loadings of the scales under S, SD, and SUD instructions correlated $.89$, $.92$, and $.94$, respectively, with the proportion of items keyed for socially desirable responses in the scales. The results indicate that the first factor of the MMPI can be interpreted in terms of social desirability.” Ss were 120 male students who took the MMPI with the S instructions and under SD instructions one week later. Another group of 150 Ss were given the MMPI with the SUD instructions.—*W. Coleman.*

5009. Golden, Jules; Mandel, Nathan; Glueck, Bernard C., Jr., & Feder, Zetta. (Albany Medical Coll., N. Y.) **A summary description of fifty “normal” white males.** *Amer. J. Psychiat.*, 1962, 119 (1), 48-56.—12 years ago, a study of all 9th-grade students in the Minneapolis public schools yielded 73 students with scores 55 or below on the MMPI. A follow-up 12 years later was conducted on 50 of the original group. A psychosocial analysis and description of this “normal” group is offered.—*N. H. Pronko.*

5010. Heilbrun, A. B., Jr. (State U. Iowa) **The psychological significance of the MMPI K scale in a normal population.** *J. consult. Psychol.*, 1961, 25 (6), 486-491.—“... there was some support for the hypothesis that K is a measure of psychological health in a normal population in the case of females only.” Relation to a defensiveness scale for the adjective check list suggests that it is a measure of defensiveness for maladjusted Ss in a normal population but not necessarily for normal Ss.—*E. R. Oetting.*

5011. Lasky, Julian J. (VA Hosp., Perry Point, Md.) **Effect of prestige suggestion and peer standards on California F Scale scores.** *Psychol. Rep.*, 1962, 11 (1), 187-191.—155 student nurses were divided at the median into high-F and low-F groups according to scores on the California F Scale, and each $\frac{1}{2}$ further divided into matched control and experimental groups. Before a retest 1 month later, high-F and low-F experimental groups were told that most student nurses had scored in the opposite direction to their own, while control groups were retested without comment. Experimental groups showed significant shifts in the direction of spurious peer performance data, while control groups did not shift. No effects due to test administrator-low or high status—were obtained.—*B. J. House.*

5012. Levinger, G. (Western Reserve U.) **Social desirability in the ratings of involved and neutral judges.** *J. consult. Psychol.*, 1961, 25 (6), 554.—A rating check list on 31 family triads shows positive correlations, in all cases, with social desirability of the items. Parents ratings of selves and children are consistently more favorable than teachers or clinicians. Studies of social desirability loadings should “concern themselves with the nature of the judge-object relationship.”—*E. R. Oetting.*

5013. Lubin, B., Levitt, E. E., & Zuckerman, M. (Indiana U. Medical Cent.) **Some personality differences between responders and nonresponders to a survey questionnaire.** *J. consult. Psychol.*, 1962, 26 (2), 192.—On the Edwards' Personal Preference

Schedule, sophomore student nurses are higher on the n Order and on the Dependency Ratio and non-responders on n Aggression.—E. R. Oetting.

5014. Nichols, Robert C. (Purdue U.) **Subtle, obvious and stereotype measures of masculinity-femininity.** *Educ. psychol. Measmt.*, 1962, 22(3), 449-461.—"Three experimental FM scales were constructed on the basis of sex difference in item response and the general expectation of a sex difference. The Subtle scale was composed of items showing sex differences which people are generally not aware of; the Stereotype scale was composed of items showing no sex difference but for which there was a general expectation of a sex difference; and the Obvious scale was composed of items showing a sex difference of which people are generally aware. . . . The Subtle and Stereotype scales correlated -.44 for female subjects and -.48 for male subjects. Possible explanations for this negative relationship, as well as other correlations among various MF scales, were discussed."—W. Coleman.

5015. Pumroy, Donald K. (U. Maryland) **Relationship between the Social Desirability scale and the California Psychological Inventory.** *Psychol. Rep.*, 1962, 10, 795-796.—"Correlations obtained between the Edwards SD scale and scales of the Gough California Personality Inventory indicate that, while social desirability is involved in the CPI scale, it is not as important a factor as with many other personality tests."—B. J. House.

5016. Quero, R., Caille, E. J. P., Boudon, R. C. P., & Lautman, J. F. **La mesure de l'adaptabilité sociale a partir de l'Inventaire de Temperament de Guilford-Zimmerman et du M.M.P.I.: Essai de construction d'un questionnaire d'adaptation sociale.** [The scale of social adaptability derived from the Guilford-Zimmerman Temperament Inventory and the MMPI: Attempt to construct a social adaptation questionnaire.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 275-285.—An experimental program is described in which various items from the Guilford-Zimmerman Temperament Inventory are combined with selected items from the MMPI to produce a 136-item questionnaire that is useful as a measure of social adaptability. A complete listing of all 136 items is given.—G. H. Mowbray.

5017. Rosenthal, R., Persinger, G. W., & Fode, K. L. (U. North Dakota) **Experimenter bias, anxiety, and social desirability.** *Percept. mot. Skills*, 1962, 15(1), 73-74.—10 naive Es conducted an experiment after having been biased to expect certain data from their Ss. Agreement of E's data with his bias was related to E's scores on Minnesota Multiphasic Inventory scales, L. K, and Pt, but not to age and grade-point average.—W. H. Guertin.

5018. Schultz, Charles B., Kogan, William S., & Chapman, Harry. (U. Washington) **Favorability, unfavorability, and content considerations in SD scales.** *Psychol. Rep.*, 1962, 10, 619-622.—"It was noted that HiSD and LoSD scales generally had lower intercorrelations than LoSD and LoSD scales. . . . To evaluate the influence of [several factors] . . . MMPI answer sheets for 252 psychiatric patients were scored for five especially contrived SD scales. The evidence shows that difference in content can make a significant difference in SD scale correla-

tions. It also shows that, when scales are matched on content, favorability or unfavorability of the items makes a significant difference in SD scale scores. This may be due to different implications of responses to the different items or to acquiescence."—B. J. House.

5019. Van de Castle, R. L. (U. Denver) **Perceptual immaturity and acquiescence among various developmental levels.** *J. consult. Psychol.*, 1962, 26(2), 167-171.—Items from the Welsh Figure Preference Test are selected for a perceptual maturity scale on the basis of differences between elementary pupils and college students with low Sc scores on the MMPI. Adult schizophrenics taking the scale score between 11-12-year-olds and normal adults. A revision to eliminate response bias improved differentiation. Theoretical discussion is included.—E. R. Oetting.

5020. Wahler, H. J. (Ohio State U.) **Response styles in clinical and nonclinical groups.** *J. consult. Psychol.*, 1961, 25(6), 533-539.—Consistent response styles, such as agree-disagree and social desirability sets, are found among college students and 2 differing groups of clinical Ss on a self-description inventory and 3 MMPI scales. Multiple interactions occur between response style, subpopulation differences, item desirability, and other differences such as types of content.—E. R. Oetting.

5021. Walder, J. N. (U. Washington) **An examination of the role of the experimentally determined response set in evaluating Edwards' Social Desirability scale.** *J. consult. Psychol.*, 1962, 26(2), 162-166.—Comparison of MMPI given normally and with instructions to maximize social desirability; significant changes occur in Edwards' SD scale, Wiggins' Sd scale, and the K scale. High SD Ss change less. Cutting scores are given.—E. R. Oetting.

5022. Webster, Harold. (U. California, Berkeley) **Acquiescence, social desirability and inhibition reflected by "response set" scales.** *Psychol. Rep.*, 1962, 10, 789-790.—"In this note it has been contended that responding 'false' to personality inventory items, and response in a socially desirable direction, are positively correlated aspects of personality; and, similarly, that endorsing such items and response in the socially undesirable direction are also positively related. Consequently, any analysis that attempts to treat personality acquiescence-denial and social desirability-social undesirability as independent runs grave risk of leading us astray."—B. J. House.

Projective Methods

5023. Burstein, A. G. (U. Michigan) **A note on time of first responses in Rorschach protocols.** *J. consult. Psychol.*, 1961, 25(6), 549-550.—A recommendation for the use of the median rather than the mean as the measure of central tendency for time of 1st response.—E. R. Oetting.

5024. Dagston, P. G., & McConnell, O. L. (Duke U.) **Stability of Rorschach penetration and barrier scores over time.** *J. consult. Psychol.*, 1962, 26(1), 104.—". . . the Fisher-Cleveland scoring system seems sufficiently objective and stable . . . to be of value."—E. R. Oetting.

5025. Epstein, S. (U. Massachusetts) **Food-related responses to ambiguous stimuli as a func-**

tion of hunger and ego strength. *J. consult. Psychol.*, 1961, 25(6), 463-469.—College students were given the Rorschach after periods of food deprivation up to 23 hours. Food imagery increased through 8 hours and decreased at 23 hours when strong food associations were eliminated. High ego strength Ss reported less hunger and produced fewer food-related responses, including a decrease at 23 hours. Food related activity responses were related to derivation; food object responses were not.—*E. R. Oetting*.

5026. Geertsma, Robert H. (U. California, Los Angeles) Factor analysis of Rorschach scoring categories for a population of normal subjects. *J. consult. Psychol.*, 1962, 26(1), 20-25.—A refactoring of Wishner's matrix (see 34: 5999) extracted 7 1st-order factors closely paralleling Rorschach scoring categories. 2 2nd-order factors were also produced.—*E. R. Oetting*.

5027. Ghosh, Molina. Influence of the presence of foreign elements in Murray TAT pictures in the contents of stories given by Indian subjects. *Shiksha*, 1962, 14(3), 98-102.—The original TAT was administered to Indian adolescents. Out of 95 Ss, only 35 seemed to be conscious of the foreign elements in the picture (60 did not make any mention). 21% of the preadolescents referred to the foreign elements. The adolescents saw most foreign elements in Picture 14 and the preadolescents in Picture 11.—*U. Pareek*.

5028. Kramer, Harvey J. Stimulus variables in auditory projective testing: I. An information theory method for measuring psychological ambiguity. II. Effects of varying ambiguity and type of content upon projection with blind and sighted. *American Found. Blind res. Ser.*, 1962, No. 9. 81 p.—2 independent but interacting investigations were conducted designed "to investigate the effects of varying ambiguity and type of content upon projective responses from auditory thematic apperception stimuli. The interactional effects of these two major stimulus variables upon projection and the effects of blindness upon the experimental relationships were measured."—*B. Lowenfeld*.

5029. Murstein, B. I., David, C., Fisher, D., & Furth, H. G. (Interfaith Counseling Cent., Portland, Ore.) The scaling of the TAT for hostility by a variety of scaling methods. *J. consult. Psychol.*, 1961, 25(6), 497-504.—100 undergraduate psychology students judged projected TAT cards for hostility. Judgments were scaled by several methods and 8 cards were selected. All of the methods could be used.—*E. R. Oetting*.

5030. Ramachandra, Rao, S. K. (All-India Inst. Mental Health) Studies with Thematic Apperception Test. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 84-106.—4 types of personality tests are enumerated: undisguised structured, disguised structured, undisguised unstructured, and disguised unstructured. Psychometric tests are structured, whereas the projective tests are unstructured and mostly disguised. 4 kinds of overviews of TAT methods are plausible: (a) the different purposes for which TAT analyses are pressed; (b) the manifold elements which are sifted out for analysis; (c) the work methods; and (d) the main approach—such as the normative, hero-oriented, intuitive, interpersonal, or perceptual.—*J. DiGiovanni*.

5031. Shentoub, V., & Shentoub, S. A. (Centre National Recherche Scientifique) Recherche expérimentale et clinique du thème "banal" dans le TAT. [Experimental and clinical research of the "banal" theme in the TAT.] *Psychiat. Enfant*, 1960, 3(2), 405-524.—Being structured to some extent, TAT pictures are expected to elicit dominant or "banal" themes. Deviations from such themes are believed to have clinical significance. The TAT protocols of 100 normal Ss and 60 psychiatric patients were compared. The results indicated that, in order to define the "banal" theme and thus deviations, the plot, conflictual level, and the degree of identification must be taken into consideration.—*R. Naar*.

5032. Tripathi, S. N., & Julka, Gulshan (Vidya-bhawan Teachers Coll., Udaipur, India) Content analysis of the Rorschach test. *U. Rajasthan Stud. (Educ.)*, 1960, 4, 21-34.—Rorschach protocols of 19 high school students were analyzed for content. The interpretations of Phillips and Smith are given followed by Indian findings. A summary of the analysis appears in the appendix.—*U. Pareek*.

PERSONALITY DIAGNOSIS

5033. Anker, J. M. (VA Hosp., Perry Point, Md.) A note on the factor structure of the neuropsychiatric chronicity scale (see 37: 3210). *J. consult. Psychol.*, 1962, 26(2), 198.—The 6 factors obtained "provide a meaningful description of the item response patterns likely to be produced by recently admitted neuropsychiatric patients destined to become chronic."—*E. R. Oetting*.

5034. Archibald, H. C., Bell, Dorothy; Miller, Christine, & Tuddenham, R. D. (VA Mental Hygiene Clinic, Oakland, Calif.) Bereavement in childhood and adult psychiatric disturbance. *Psychosom. Med.*, 1962, 24(4), 343-351.—In a comparative sample of 1000 psychiatric patients with the general population, it was found that the psychiatric group showed an appreciably greater frequency of bereavements in childhood. In direct contrast to the controls, the patients tended to lose their parents when younger. In the MMPs of 100 patients the Depression scores tended to be elevated.—*W. G. Shipman*.

5035. Defayolle, M., Matthieu, M., & Fustier, P. Essai d'une approche psychométrique du test de l'arbre. [Trial of a psychometric approach of the tree test.] *Psychol. Franc.*, 1962, 7(3), 223-229.—250 normal men of age 20, 35 delinquents, and 115 psychiatric patients were asked to draw a tree. The drawings were objectively scored and the scores factor analyzed. 2 factors were extracted. The normals were differentiated from the psychiatric cases except for some overlap with the anxiety cases.—*C. J. Adkins*.

5036. Goldfried, Marvin R. (U. Rochester) On differences in meaning between normals and neurotics. *Psychol. Rep.*, 1962, 11(1), 183-186.—A criticism of a study by Luria (see 34: 1521) which distinguished normal and neurotic groups on the basis of semantic differential responses. Ambiguities of interpretation arising from the method of selected instances are discussed, as well as some statistical questions.—*B. J. House*.

5037. Goucher, E. L., Riggs, L. E., Efron, H., Myers, R. F., & Scanlan, E. R. (VA Hosp., Lyons,

N. J.) **Lyons relationship scales: A study of reliability.** *J. consult. Psychol.*, 1961, 25(6), 556.—Reliability is demonstrated for both schedules of a 2-way scale for assessing patient family relationship.—*E. R. Oetting.*

5038. **Govindaswamy, M. V.** **Intuition or evaluation? Panic problems in psychiatric assessment.** *Pratibha*, 1959, 2(1), i-viii.—Psychiatric treatment must be evaluated scientifically with the patient as the central frame of reference. This is possible through dynamic diagnosis which takes into account factors like ego strength, areas of affection, intensity of the disturbance, nuclei around which signs and symptoms cluster, and the environmental situation. Present evaluations neglect the social factors in therapy. No attempt is made to trace the "message" of the symptoms to the past. The integrated approach of various disciplines can help psychiatry solve the problem.—*U. Pareek.*

5039. **Gynther, M. D.** (Washington U. Medical School) **The clinical utility of "invalid" MMPI F scores.** *J. consult. Psychol.*, 1961, 25(6), 540-542.—Among 246 white male court referrals, 39 had F scores over 16. Most of these were classified as behavior disorders. The remainder were judged as psychotics, none as neurotics.—*E. R. Oetting.*

5040. **Hathaway, S. R.** (U. Minnesota) **Problems of personality assessment.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 144-160.—The possibility exists that personality test development has been hampered by attempts to eliminate the observer. An approach based upon the type concept of personality, using a "rigorous combination of statistical and clinical processing" is proposed.—*B. T. Jensen.*

5041. **Jones, L. W., & Thomas, C. B.** **Studies on figure drawings.** *Psychiat. Quart. Suppl.*, 1961, 35(2), 212-261.—Review of the figure drawing literature from 1949 through 1959 shows an increased use of the Draw-A-Person Test with more emphasis on its research role. As yet there is no universally accepted scoring procedure. Witkin's major study has shown that reliable scoring and statistically significant correlations can be made between figure drawing scores and other test scores such as the Rorschach. The Draw-A-Person Test promises to become a simple and effective screening device for the personality appraisal of normal Ss.—*D. Prager.*

5042. **Manning, Mary Jane, & Glasser, Betty Ann.** (Roxbury Court & Clinic, Boston, Mass.) **The home visit in the treatment of psychiatric patients awaiting hospitalization.** *J. Hlth. hum. Behav.*, 1962, 3(2), 97-104.—In order to study the effects of a home visit on psychiatric patients awaiting treatment, 16 individuals were visited. Home visits were found to be an effective diagnostic and treatment tool. Moreover, the best time seemed to be after an initial intake office interview. While subsequent treatment of these 16 cases was relatively successful, the results were interpreted cautiously. Larger Ns in future studies should provide more conclusive results.—*L. A. Ostlund.*

5043. **Overall, John E., & Gorham, Donald R.** (Kansas State U.) **The Brief Psychiatric Rating Scale.** *Psychol. Rep.*, 1962, 10, 799-812.—"Descrip-

tion of a brief psychiatric rating scale is presented, along with recommendations for its use. The scale was developed in an effort to meet the need for an efficient, rapid and economical method of assessing treatment change in psychiatric research, although usefulness of the instrument for patient classification and other research is suggested. The instrument contains 16 ordered category rating scales to be completed following a 20-min. clinical interview. Each of the 16 scales was developed to assess patient symptomatology in a relatively discrete symptom area identified in previous investigations."—*B. J. House.*

5044. **Perez-Reyes, M., Shands, H. C., & Johnson, G.** (U. North Carolina Medical School, Chapel Hill) **Galvanic skin reflex inhibition threshold: A new psychophysiological technique.** *Psychosom. Med.*, 1962, 24(3), 274-277.—18 depressed patients were divided by standard clinical criteria into 2 groups: 10 psychoneurotics and 8 psychotics. Sodium thiopental was administered as a sedative to note the GSR changes that occur between the 2 groups. It was concluded that the GSR inhibition threshold is a simple and objective method that seems to differentiate, at a high level of reliability, between psychotically and psychoneurotically depressed Ss. (16 ref.)—*W. G. Shipman.*

5045. **Raush, Harold L., & Sweet, Blanche.** **The preadolescent ego: Some observations of normal children.** *Psychiatry*, 1961, 24(2), 122-132.—A discussion of a few aspects of ego functions and achievements which distinguish well-adjusted from hyperaggressive children, with illustrations and speculations.—*C. T. Morgan.*

5046. **Reitan, R. M., & Reed, H. B. C., Jr.** (Indiana U. Medical Cent.) **Consistencies in Wechsler-Bellevue mean values in brain-damaged groups.** *Percept. mot. Skills*, 1962, 15(1), 119-121.—Rank-order distributions of Wechsler-Bellevue subtest means were prepared for groups of Ss with lateralized cerebral lesions and for groups of Ss with diffuse cerebral dysfunction. The rank-order distributions of subtest means were then compared using rank-difference correlation coefficients. The results indicate that lateralized cerebral lesions result in differential impairment of Wechsler-Bellevue performances but that groups of Ss with diffuse or heterogeneous cerebral damage demonstrate a high degree of consistency in their Wechsler-Bellevue performances.—*W. H. Guertin.*

5047. **Riddel, S. A.** (Banstead Hosp., Sutton, Surrey, England) **The relationships between tests of organic involvement, memory impairment and diagnosis in elderly psychiatric patients.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 228-231.—"The performances of a group of elderly psychiatric patients on Inglis' Auditory Recall Test and Walton and Black's Modified Word Learning Test [MWLT] were examined in relation to one another and in relation to psychiatric diagnosis. Correlations between the tests were low. The MWLT, using Terman-Merrill Vocabulary [T-M], correlated significantly more highly with diagnosis than did the MWLT using the WAIS Vocabulary. The MWLT (T-M) also correlated more highly with diagnosis than did either form of the ART."—*C. M. Franks.*

5048. **Sperber, Z.** (Children's Hosp., Philadelphia, Penn.) **Rigidity and conformity tendencies**

of judges and their utilization of autobiographical material in making predictions. *J. consult. Psychol.*, 1962, 26(2), 144-148.—Using the California F Scale and Sanford and Wesley's Rigidity Scale, Ss' rigidity was positively related to a change in predicting Guilford's STDCR responses from the 1st $\frac{1}{2}$ and the complete autobiography. Accuracy of the less rigid Ss tended to improve.—*E. R. Oetting.*

5049. Vispo, Raul H. (Queen's U., Kingston, Ontario, Canada) **Pre-morbid personality in the functional psychoses of the senium. A comparison of ex-patients with healthy controls.** *J. ment. Sci.*, 1962, 108(Whole No. 457), 790-800.—Clinical study of 25 ex-patients and 25 controls indicates sharp differences in personality in earlier years, but not sufficient to allow prediction of breakdown from specific personality attributes. The approach of death presents a final challenge which the neurotic may be unable to meet.—*W. L. Wilkins.*

5050. Weiner, I. B. (U. Rochester School Medicine & Dentistry) **Rorschach tempo as a schizophrenic indicator.** *Percept. mot. Skills*, 1962, 15(1), 139-141.—4 indices of deviant Rorschach tempo were derived from normally expected response rates. In 2 samples of 82 and 83 patients, the presence of any one of these indices was significantly associated with a diagnosis of schizophrenia. This variable correctly classified $\frac{3}{4}$ of the total population as schizophrenic or nonschizophrenic.—*W. H. Guertin.*

5051. Whitaker, L., Jr. (Wayne Co. General Hosp., Mich.) **The use of an extended draw-a-person test to identify homosexual and effeminate men.** *J. consult. Psychol.*, 1961, 25(6), 482-485.—Of 236 men referred to a court clinic, those rated as homosexual and/or effeminate produced significantly more female figures as a free choice in a draw-a-person test extended to one more free figure. For predictive purposes, improvement over the base rate is minimal.—*E. R. Oetting.*

PERSONALITY ADJUSTMENT

5052. Bendig, A. W. (U. Pittsburgh) **Factor analytic scales of covert and overt hostility.** *J. consult. Psychol.*, 1962, 26(2), 200.—A 20-item scale for covert hostility and a 14-item scale for overt hostility are obtained by factor analysis from the Buss-Durkee Hostility Inventory. Reliabilities and intercorrelations are reported.—*E. R. Oetting.*

5053. Berkowitz, Leonard; Green, James A., & Macaulay, Jacqueline R. (U. Wisconsin) **Hostility catharsis as the reduction of emotional tension.** *Psychiatry*, 1962, 25(1), 23-31.—80 Ss were angered, with one group permitted to strike the frustrator and another group denied this opportunity. The Ss, believing that their frustrator had been harmed, experienced less tension than the others. The Ss who "catharted," however, did not appear to have become friendlier to the frustrator and in fact might be just as apt to be angered by the same individual in the future.—*H. M. Cohen.*

5054. Block, U. (U. California, Berkeley) **Ego strength and conflict discrimination: A failure of replication.** *J. consult. Psychol.*, 1961, 25(6), 551-552.—A replication of Korman's study (see 35: 2220) with normal Ss shows no significant relationship.—*E. R. Oetting.*

5055. Buss, A. H., Fischer, H., Simmons, A. J. (U. Pittsburgh) **Aggression and hostility in psychiatric patients.** *J. consult. Psychol.*, 1962, 26(1), 84-89.—Aggression and hostility are assessed by a number of different techniques. Ratings by psychologists, psychiatrists, and relatives tend to be unrelated but on factor analysis all show an Aggressiveness and a Hostility factor. The level of emitting hostile verbs and solutions to scrambled sentences may be better than all other measures. The Iowa Picture Interpretation Test is related to these measures. Rorschach hostility is not. Ratings of psychiatrists and female relatives are related to the Buss-Durkee Inventory.—*E. R. Oetting.*

5056. Carrier, Neil A. (Southern Illinois U.) **Need correlates of "gullibility."** *J. abnorm. soc. Psychol.*, 1963, 66(1), 84-86.—The gullibility of college students in accepting false personality analyses of themselves was found to be positively related to the achievement, deference, and introception variables of the EPPS among male Ss. Among female Ss, gullibility was positively related to abasement and introception and negatively related to endurance.—*Journal abstract.*

5057. Cattell, James P. **Deprivation and fantasy: Early experiences, later developments, and therapeutic connotations.** *Comprehen. Psychiat.*, 1961, 2(5), 304-307.—"The purpose of this communication is to point out that: 1) frequency, content, and later adverse reverberations of early fantasy are intimately related to specific deficiencies of opportunity for early environmental experiences and to distortion of reality communicated thru parental attitudes, conceptions, and patterns of behavior, and 2) it is pertinent to re-emphasize the therapeutic value of reclaiming these fantasies to consciousness and recognizing their relationships to early experiences and current functioning."—*D. Prager.*

5058. Collier, Mary Jeffery. (Kalamazoo Coll.) **The psychological appeal in the Cinderella theme.** *Amer. Imago*, 1961, 18(4), 399-411.—College women whose favorite childhood story was Cinderella attributed its childhood appeal to its generally wish-fulfilling character; the romantic love theme; the heroine's triumph over stepmother and stepsisters; her attractiveness, magically enhanced; and her eventual mastery of self and environment. As adults, they stressed the story's literary merits and moral truths and found it considerably less attractive except for presentation to children.—*W. A. Varvel.*

5059. Dorfman, Donald D., & Zajonc, Robert H. (U. Michigan) **Some effects of sound, background brightness, and economic status on the perceived size of coins and discs.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 87-90.—"Rich" and "poor" children estimated the size of coins and discs under sound vs. no sound conditions and 2 levels of background brightness. Contrary to prediction, no relation was found to exist between sound level and size estimation, although such a relation did exist for background brightness. The findings failed to replicate the data of Bruner and Goodman, whereas they were in substantial agreement with those of Carter and Schooler. These results were as follows: (a) large coins tended to be judged larger, and small coins judged smaller than neutral discs of comparable size; and (b) no differential effect was observed on the

estimations of coins and discs as a function of economic status. There was, however, a reliable tendency for the children of lower economic status to overestimate both coins and discs when compared with those of higher status. (17 ref.)—*Journal abstract*.

5060. Freitas, Euridice. Dinamicas da personalidade. [Personality dynamics.] *Arqu. Brasil. Psicotec.*, 1960, 12(3), 71-76.

5061. Garretson, Wynona S. (State U. Iowa) The consensual definition of social objects. *Sociol. Quart.*, 1962, 3, 107-113.—A consistent relationship was found between the type of answers given to the question, "Who am I?" and the question, "What is —?" where the blank was filled by the name of a social group to which the respondent belonged. Those persons describing themselves in terms of directly understandable social and classificatory attributes also described their groups the same way. Those persons emphasizing idiosyncratic attributes in their self-definitions also tended to mention more idiosyncratic aspects of their social groups.—K. E. Davis.

5062. Goldberger, L. (New York U.) The isolation situation and personality. In G. Nielson (Ed.), *Proceedings of the International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 128-143.—Some general and specific effects of perceptual isolation are described and the role of individual differences and personality in determining behavior discussed. (48 ref.)—B. T. Jensen.

5063. Gynther, M. D., Miller, F. T., & Davis, H. T. (South Carolina State Hosp.) Relations between needs and behavior as measured by the Edwards PPS and Interpersonal Check List. *J. soc. Psychol.*, 1962, 57(2), 445-451.—This study was designed to investigate the relations between scores on the Edwards PPS and the Interpersonal Check List (ICL), tests which are purported to measure needs and behavior, respectively. 95 undergraduate male students served as Ss. Significant, systematic relationships were found between scores on the 2 tests, suggesting that the relations between them are direct and, to some extent, predictable. For example, it was predicted and confirmed that the ICL Love variable is positively associated with EPPS needs Affiliation and Nurturance and negatively associated with needs Autonomy and Aggression. Extrapolation of these results to statements about the relations between needs and behavior may not be warranted due to the relative lack of objective support for such interpretation of the tests. The possibilities that the tests measure very nearly the same level of behavior or are both influenced by the social desirability factor were presented as alternative explanations of the results.—*Author abstract*.

5064. Hiltner, Seward, & Rogers, William R. (Princeton Theological Seminary) Research on religion and personality dynamics. *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 128-140.—Interaction of personality dynamics and religion is discussed.—S. A. Walters.

5065. Joshi, Devki. Some adjustment mechanisms. *Shiksha*, 1962, 14(3), 117-121.—Adjustment mechanisms can be grouped as adjustment by defence, adjustment by withdrawing, adjustment in-

volving fear and repression, adjustment by ailments, and persistent nonadjustive reactions.—U. Pareek.

5066. Krishnamurthy, N. (All-India Inst. Mental Health) The Sankhya conception of personality. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 115-121.—There are 2 distinct, though interdependent, entities postulated in the Sankhya system: (a) purusa (spirit), representing the psychic element, and (b) prakrti (nature), the physical element. Personality, therefore, consists of: (a) the experiencer or witness, (b) intellect or judgment derived from the primal cause, (c) ego-consciousness derived from intellect, (d) mind derived from ego, and (e) cognitive and conative organs.—J. DiGiovanni.

5067. Lindgren, H. C. (San Francisco State Coll.) Age as a variable in aversion toward food and occupations. *J. consult. Psychol.*, 1962, 26(1), 101-102.—"College students 21 and under tended to indicate dislike for more foods and more occupations than did students over 21. The tendency to reject foods was positively correlated with the tendency to reject occupations."—E. R. Oetting.

5068. Marlowe, D. (Dartmouth Coll.) Need for social approval and the operant conditioning of meaningful verbal behavior. *J. consult. Psychol.*, 1962, 26(1), 79-83.—Ss showing a high need for approval on the Marlowe-Crowne Social Desirability scale produce more positive self-references when these are verbally reinforced.—E. R. Oetting.

5069. McClelland, D. C. (Harvard U.) The achievement motive in economic growth. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 60-80.—Need for achievement as indicated in children's readers was compared to national economic growth, and positive relationships were found even in Communist countries. Also studied were managers and professionals in several countries.—B. T. Jensen.

Suppl.), 111-127.—A review of the controversy regarding the self-concept and a discussion of problems of measurement associated with study of values by means of self-concept approach.—*S. A. Walters.*

5076. **Shaw, D. M., & Campbell, E. Q.** (U. North Carolina) *Internalization of a moral norm and external support.* *Sociol. Quart.*, 1962, 3, 57-71.—210 male freshmen at Duke University and the University of North Carolina reported their parents' feelings about their use of alcohol, their own drinking behavior, their informal associations and religious attendance, and responded to a series of hypothetical dilemmas involving the use of alcohol. Those students who drank without parental approval were similar to those students who drank without parental opposition in the amount of drinking, their informal association, and their low frequency of attendance at religious services. Those who drank without parental approval were, however, similar to nondrinkers in their religious training and attendance prior to college and in some of their responses to hypothetical dilemmas. It was concluded that those who drank, even though they felt moral pressure not to, tended to seek support through their informal association for their deviant behavior.—*K. E. Davis.*

5077. **Yates, Aubrey J.** (U. Western Australia) *A comment on Bookbinder's critique of "Symptoms and Symptom Substitution."* *Psychol. Rep.*, 1962, 11(1), 102.—A discussion of criticisms (see 37: 1475) of a previous paper by Yates (see 33: 9431).—*B. J. House.*

Anxiety

5078. **Bergs, L. P., & Martin, B.** (U. Wisconsin) *The effect of instructional time interval and social desirability on the validity of a forced-choice anxiety scale.* *J. consult. Psychol.*, 1961, 25(6), 528-532.—Female college students show a high relationship between a forced choice anxiety scale scored to reduce variance from social desirability and a composite score in a mild stress situation based on skin conductance, blood pressure, and anx-

iety ratings. Relationship is highest when the directions specify "last six months." Correlations were not significant when scoring included social desirability. Males show no relationship.—*E. R. Oetting.*

5079. **Bowlby, John.** *Die Trennungsangst.* [Separation anxiety.] *Psyche, Stuttgart*, 1961, 15(7), 411-464.—English version published in the *International Journal of Psycho-Analysis* (see 35: 2309).—*E. W. Eng.*

5080. **Craddick, R. A., Deipold, W. D., & Cavas, P. D.** (U. North Dakota) *The relationship of shading on the Draw-a-Person Test to Manifest Anxiety scores.* *J. consult. Psychol.*, 1962, 26(2), 193.—Ratings of shading and ratings of anxiety from the test are reliable and related. MA is not related to either.—*E. R. Oetting.*

5081. **Di Lollo, Vincent, & Lumsden, James.** (U. Western Australia) *The Crespi effect: A replication.* *Psychol. Rep.*, 1962, 11(1), 25-26.—"Elation and depression effects were demonstrated using appropriate controls. The results do not support Spence's objections regarding the genuineness of elation effects."—*B. J. House.*

5082. **French, John W.** (Educational Testing Service) *Effect of anxiety on verbal and mathematical examination scores.* *Educ. psychol. Measmt.*, 1962, 22(3), 553-564.—To determine whether excessive anxiety reduces the validity of a test, a "relaxed" test was given before or after the College Board aptitude test. Additional data were obtained from a broad questionnaire, 2 scales measuring generalized anxiety, and grades in 4 high school subjects. "The results show the effects of anxiety to be small. A comparison of scores on the relaxed tests with alternate test forms taken with the college entrance test indicates no effect of anxiety for boys, while anxiety seems to be associated with a slight but significant improvement of girls' mathematical scores relative to their verbal scores."—*W. Coleman.*

5083. **Hammes, J. A., & Osborne, R. T.** (U. Georgia) *Discrimination of manifest anxiety by the Structured-Objective Rorschach Test.* *Percept. mot. Skills*, 1962, 15(1), 59-62.—38 low-anxious and 31 high-anxious Ss selected on the basis of a manifest anxiety scale were given the Structured Objective Rorschach Test. Of 26 Rorschach factors, only 2 were found to be discriminative, Dd and S. The Fch factor, presumably a direct measure of anxiety, was nondiscriminative.—*W. H. Guertin.*

5084. **Robbins, Paul R.** (United States Dept. Health, Education & Welfare) *Some explorations into the nature of anxieties relating to illness.* *Genet. Psychol. Monogr.*, 1962, 66(1), 91-141.—A series of exploratory studies was conducted to learn more about the nature of anxieties people hold in regard to illness. The studies employed the intensive interview method and a provisional psychometric instrument called the Medical Attitude Inventory (MAI). From the intensive interview data, it was learned that there were considerable differences in the way the several diseases were perceived. A factor analysis of the MAI was undertaken which yielded 8 factors. 2 of these factors could not be meaningfully identified, 3 of the factors dealt with specific diseases, and 1 factor dealt with the concept of curability of illness.—*Author abstract.*

5085. Scheier, I. H., Cattell, R. B., & Sullivan, W. P. Predicting anxiety from clinical symptoms of anxiety. *Psychiat. Quart. Suppl.*, 1961, 35(1), 114-126.—2 studies, 1 of 186 and the 2nd of 86 normal college students. A total anxiety-symptom checklist (95 items) score correlated significantly with the anxiety criterion. About $\frac{1}{2}$ of the single anxiety symptoms, however, did not correlate significantly with the anxiety criterion index, perhaps because they were really not specifically related to anxiety but were associated with it as a result of other personality factors.—D. Prager.

5086. Shoenberger, Richard W., & Harris, C. Stanley. Subjective and behavioral "certainty" in a male population. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-5001, Subtask 12, Rep. No. 3. ii, 5 p.—In an investigation of the generality and relationship to manifest anxiety of several tests which purport to measure subjective and behavioral "certainty," Wolff, using female Ss, obtained largely negative results. This investigation extends Wolff's study, using male Ss. 2 "subjective certainty" measures, 2 "behavioral certainty" measures, and a manifest anxiety measure were used. Results with behavioral certainty were again essentially negative. However, unlike Wolff's results, statistically significant correlations were obtained among the subjective certainty measures and anxiety, presenting somewhat more evidence for the generality and relationship to manifest anxiety of subjective certainty among males than among females.—USN SAM.

Defenses

5087. Roth, N. (NYC) Ego defenses and perception. *Percept. mot. Skills*, 1962, 15(1), 117-118.—Particular psychiatric syndromes employ characteristic mechanisms of defense of the ego, which evoke specific perceptual dysfunction. In the case of vision, such perceptual defect is readily detected in dreams and verified in waking hours. An illustrative example is given of the defense of isolation and its accompaniment by impairment of stereoscopy and of the appreciation of perspective.—W. H. Guertin.

5088. Rouart, J. La temporisation comme maîtrise et comme défense. [Temporizing as control and as defense.] *Rev. Franc. Psychanal.*, 1962, 26(4), 383-422.—Behavior changes and ideas of time relations have long been seen simply as modifications in the nervous centers. Phenomenological studies, making a distinction between transitory and immanent time, indicate that time disturbances point to severe psychotic illness. The present study traces the genesis of the earliest manifestations of time integration in infancy. Clinical experience reveals particular time disturbances in obsessional neuroses. The frustration of oral expectation in infants predisposes to subsequent faulty phase development.—G. Rubin-Rabson.

5089. Zajonc, Robert B. (U. Michigan) Response suppression in perceptual defense. *J. exp. Psychol.*, 1962, 64(3), 206-214.—"The role of stimuli and responses in perceptual defense was examined by first obtaining recognition thresholds and GSRs to taboo and neutral words. Subsequently, Ss learned a paired-associate list with the original words serving as stimulus terms and a new set of words as response terms. Half of the neutral stimuli were

paired with neutral and half with taboo responses. The same was true of taboo stimuli. Following training, recognition thresholds and GSRs were again measured with one group required to indicate recognition by means of response terms and another by means of stimulus terms. Both recognition threshold and GSR were found to depend primarily on the response required of the Ss in indicating recognition.—J. Arbit.

PSYCHOANALYTIC THEORY

5090. Brückner, Peter. Sigmund Freuds Privatlektüre. [Freud's personal reading.] *Psyche, Stuttgart*, 1962, 15(12), 881-902.—In a review of source materials, references of Freud to his pleasure reading are noted. Special emphasis is given to Milton's *Paradise Lost*, Cervantes' *Don Quixote*, 18th-century England, Fielding's *Tom Jones*, and Sterne's *Tristram Shandy*.—E. W. Eng.

5091. Brückner, Peter. Sigmund Freuds Privatlektüre: Fortsetzung. [Freud's personal reading: Continuation.] *Psyche, Stuttgart*, 1962, 16(4), 721-743.—Discussion of Freud's reactions to his readings in Dickens, Thackeray, and Multatuli in terms of the development of his own thinking.—E. W. Eng.

5092. Dracoulides, N. N. (27 Hipiron, Athens, Greece) Interpretation psychanalytique d'un néographisme intégré à un néomorphisme. [Psychanalytical interpretation of a neographic word in a neomorphic drawing.] *Acta neurol. psychiat. Belg.*, 1962, 62, 250-263.—The author discusses G. Maccagnani and J. Bobon's recent paper (see 37: 1770). He considers that these drawings produce a therapeutic effect on the patient. He also gives examples of the verbal, plastic, and sensorial synergy in art and compares the "plastic signs" with the drawings of a Spaniard painter of sounds. This paper ends with a comparison between modern art and the manifestations of glossomania as exposed in another article of Bobon. The author concludes that puerility, absurdity, and abstractedness, as frequently found in modern art, are reactions for compensation of the collective anxiety of our time.—V. Sanua.

5093. Freud, Sigmund. (Trans. by J. Strachey) *The ego and the id*. New York: Norton, 1962. 80 p. \$.95 (paper).—A paperback edition of a book published in 1960.—C. T. Morgan.

5094. Heilbrunn, G. The neurobiologic aspect of three psychoanalytic concepts. *Comprehen. Psychiat.*, 1961, 2(5), 261-268.—Recent neurobiological findings affirm the patency of the pleasure-pain principle, repression, and the unconscious. At the same time these findings point in the direction from which basic innovations and modifications may be expected, namely quantification and eventually technical manipulation to expedite, implement, and/or substitute certain psychotherapeutic measures.—D. Prager.

5095. Kuiper, P. C. Probleme der psychoanalytischen Technik in bezug auf die passiv-feminine Gefühlseinstellung des Mannes, das Verhältnis der beiden Ödipuskomplexe und die Aggression. [Problems of psychoanalytic technique relative to the male passive-feminine attitude, the relation of the two Oedipus complexes, and aggression.] *Psyche, Stuttgart*, 1962, 16(6), 321-344.—Interpretation to men of their passive feminine attitude as a regressive defen-

sive maneuver calls for tact, directness, and timing. Like all interpretations it should be guided by how much the patient can accept at the time, and how much meaningful evidence there is in the therapy material for the interpretation at the time. Interpretation is made more difficult by the manifold alternations of sexual and aggressive impulses and positive and negative Oedipus complexes between positions of defense and drive gratification.—*E. W. Eng.*

5096. Kunz, Hans. *Die eine Welt und die Weisen des In-der-Welt-Seins: Teil I.* [The one world and the modes of being-in-the-world: Part I.] *Psyche, Stuttgart*, 1962, 16(1), 58-80.—Comments on the presuppositions of existence-analytic "anthropological" interpretations of psychopathological phenomena. The criterion for the validity of existence analytic is the sense of one's own existence revealed in the course of one's self-understanding as a human being, and not merely the understanding of Heidegger's concepts and their relations.—*E. W. Eng.*

5097. Kunz, Hans. *Die eine Welt und die Weisen des In-der-Welt-Seins: I. Fortsetzung.* [The one world and the modes of being-in-the-world: I. Continuation.] *Psyche, Stuttgart*, 1962, 16(2), 142-159.—By his assertion that reality is no less present in the dream than in waking life, Medard Boss gives up the integrality of the world to the plurality of forms of being. This is an instance of the difficulties of stating our understanding of the functioning of infra-ego cognitive processes in the terms characterizing conscious and individuated ego activities.—*E. W. Eng.*

5098. Kunz, Hans. *Die eine Welt und die Weisen des In-der-Welt-Seins: I. Fortsetzung.* [The one world and the modes of being-in-the-world: I. Continuation.] *Psyche, Stuttgart*, 1962, 16(3), 221-239.—The "integrity" of things is not to be confused with objects "on hand" derived from the means "at hand" as developed in our encounters within the world. The objectivated world of things "on hand" has emerged out of the active intensions of man in his denial of his openness and temporality. "Being," like "nothingness," is an achievement of human thought, even though the world of things in their suchness is simply given for us, and is by no means something achieved.—*E. W. Eng.*

5099. Kunz, Hans. *Die eine Welt und die Weisen des In-der-Welt-Seins: I. Fortsetzung.* [The one world and the modes of being in the world: I. Continuation.] *Psyche, Stuttgart*, 1962, 16(6), 378-400.—Questioning, doubting, denying are actions of thought which confront the perceived, imagined, believed, or supposed existence with its possible "not being" or "not being so." Such actions are ultimately grounded in the life-destroying power of factual death, which however, in accord with its provisionally inherent presence, manifests itself only as a potentially negative power. In this characteristic of human being is also rooted our distance to encounters with existence within the world.—*E. W. Eng.*

5100. Meng, Heinrich. *War Buddha schizophren?* [Was Buddha schizophrenic?] *Psyche, Stuttgart*, 1962, 16(6), 374-377.—In answer to Lange-Eichbaum's question, it is evident that the Buddhist meditative trance, although involving a withdrawal of libido from the object world, is nonetheless a way to

the overcoming of death anxiety and realization of the meaning of the past. Buddha and Freud both discovered a new language leading to greater understanding of the self and others.—*E. W. Eng.*

5101. Mitscherlich-Nielsen, M. *Probleme der psychoanalytischen Technik in bezug auf die passiv-feminine Gefühlseinstellung des Mannes, das Verhältnis der beiden Ödipuskomplexe und die Aggression: Korreferat.* [Problems of psychoanalytic technique relative to the male passive-feminine attitude, the relation of the two Oedipus complexes, and aggression: Co-report.] *Psyche, Stuttgart*, 1962, 16(6), 345-354.—Conflicts and reactions can only be successfully analyzed where, on the one hand, they are intensively experienced in awareness, and where, on the other hand, we succeed in securing for the patient distance from them by working them through.—*E. W. Eng.*

5102. Pellegrino, Helio. *Versuch einer Neu-Interpretierung der Ödipussage.* [A new interpretation of the Oedipus legend.] *Psyche, Stuttgart*, 1961, 15(7), 475-485.—Oedipus' hatred is basically directed to the mother, by whom he feels himself to have been thrown helpless into existence. So in the legend it is his mother Jocasta who agrees to his death by exposure as an infant, and who, in the end, finally kills herself. The Oedipus complex as described by Freud is an attempt to master this insecurity with the mother figure at a more advanced level of development.—*E. W. Eng.*

5103. Pieper, William J., & Muslin, Hyman L. (U. Illinois Coll. Med.) *A further note on the primal instinct theory.* *Amer. Imago*, 1961, 18(4), 383-390.—In his operational concepts, Freud was a dualist, but his theoretical bias rested on a physical-chemical monistic conception of man. The concepts of primal life and death instincts can not be included in an empirically oriented scientific psychology. These are "issues more properly philosophical, specifically metaphysical, and their verisimilitude has to be judged on this basis and not by the evidence biological data affords." The clinical phenomena underlying these problems are still in need of explanation.—*W. A. Varvel.*

5104. Scheffen, Albert E. *A common defect in extrapolation: Explaining psychic and social processes in terms of feeding.* *Psychiatry*, 1961, 24(2), 143-152.—"Faulty extrapolations are characteristic of psychotic and neurotic thinking, but they are by no means uncommon in everyday conjecture and in psychiatric theory. One extremely common type of faulty extrapolation [is examined]. . . . processes such as communication, learning, and emotion operate in the same manner as ingestion and incorporation."—*C. T. Morgan.*

5105. Zulliger, Hans. *Eine infantile Teufels-neurose.* [An infantile neurosis of demoniacal possession.] *Psyche, Stuttgart*, 1962, 16(3), 161-175.—In the effective psychoanalytic treatment of a 4-year-old boy by means of play therapy, his obsessive "devil" turned out to be a castrating parental fusion of a penis-endowed mother and the "bad father." Similarly, in the historical witch cult the devil endows his followers with supernatural powers and a substitute penis (broom or pitchfork) for which they must pay with loss of salvation, i.e., be once more castrated.—*E. W. Eng.*

PHYSIOLOGICAL CORRELATES

5106. Adsett, C. A., Schottstaedt, W. W., & Wolf, S. G. (U. Oklahoma Medical Cent., Oklahoma City) **Changes in coronary blood flow and other hemodynamic indicators induced by stressful interviews.** *Psychosom. Med.*, 1962, 24(4), 331-336.—30 male Ss, aged 29-69, were studied before and during stressful interviews. Coronary blood flow, blood pressure, and pulse rate, cardiac output and peripheral resistance were calculated. Changes in cardiac output, peripheral resistance, and coronary blood flow corresponded with judgments of the S's feeling states. Coronary flow increased in association with both anger and anxiety. (22 ref.)—W. G. Shipman.

5107. Cohen, H. (Childrens Hosp., Boston, Mass.) **Psychological test findings in adolescents having ovarian dysgenesis.** *Psychosom. Med.*, 1962, 24(3), 249-256.—10 adolescent girls with ovarian dysgenesis were studied by means of a Wechsler Intelligence Test, Draw-A-Person, TAT, and Rorschach. Average IQ was 96, with verbal higher than performance. The figure drawings were infantile. The TAT and Rorschach evoked vague, easy responses and indicated an avoidance of angry and/or sexual feelings.—W. G. Shipman.

5108. Davis, J., Morrill, R., Fawcett, J., Upton, V., Bondy, P. K., & Spiro, H. M. (Yale U. School Medicine, New Haven, Conn.) **Apprehension and elevated serum cortisol levels.** *J. psychosom. Res.*, 1962, 6(2), 83-86.—"Plasma hydrocortisone levels of 15 volunteer Ss were measured in a 'first time' situation when the Ss were unfamiliar with the blood drawing situation and control situations where the Ss were accustomed to the blood drawing procedures. There was a significant increase in the blood hydrocortisone levels in the 'first time' situation." The Leary Interpersonal Adjective Check List indicated that "first time" reactors were low on the following dimensions: managerial-autocratic, competitive narcissistic, and aggressive-sadistic.—W. G. Shipman.

5109. Gottschalk, L. A., Kaplan, S. M., Gleser, Goldine C., & Winet, Carolyn M. (U. Cincinnati Medical School) **Variations in magnitude of emotion: A method applied to anxiety and hostility during phases of the menstrual cycle.** *Psychosom. Med.*, 1962, 24(3), 300-310.—The sensitivity of a newly developed method of measuring immediate affect levels from small samples of speech is demonstrated in a study to detect the effect on personality of the biological rhythms of the menstrual cycle in 5 Ss. There was a tendency for the levels of anxiety and hostility inwards to decrease transiently around the time of ovulation and for these to individually vary. The presumed cause is some hormonal change not yet ascertained.—W. G. Shipman.

5110. Lairy, G. C. (Inst. National d'Hygiene) **EEG et neuropsychiatrie infantile.** [EEG and child neuropsychiatry.] *Psychiat. Enfant*, 1960, 3(2), 525-608.—Analysis of EEG records of children at various stages of maturation failed to reveal a specific relationship with intellectual, psychomotor, and personality factors. This is due to the fact that EEG records are obtained while the patient is in a state of psychomotor and psychosensory inactivity, yet are correlated with psychological variables interpreted in

behavioral terms. Interpretation of children's EEGs should be done in terms of inner states and the experimental situation as well. The physiological plasticity of the child's rhythmic pattern should also be taken into consideration.—R. Naar.

5111. Sloane, R. B., Inglis, J., & Payne, R. W. (Queen's U., Kingston, Ontario, Canada) **Personal traits and maternal attitudes in relation to blood lipid levels.** *Psychosom. Med.*, 1962, 24(3), 278-285.—48 healthy, college men, with a normal distribution of fasting blood cholesterol levels, were studied by psychiatric interview and self ratings. Their mothers did a child-rearing attitudes questionnaire. The psychiatrist's prediction of lipid level, from personality, correlated .58. High lipid levels were significantly associated with high ratings of needs for social achievement, autonomy, ambition, hostility, and inflexibility. The high cholesterol students rated themselves low in ambition. Their mothers favored a strict upbringing. (28 ref.)—W. G. Shipman.

THERAPY & GUIDANCE

5112. Flach, F. F. **A study of the reliability of the Social Behavior Chart.** *Comprehen. Psychiat.*, 1961, 2(2), 121-128.—28 of the 52 items on the Social Behavior Chart proved to be statistically reliable in providing emotional and behavioral profiles of 44 patients during the entire ward day. It is emphasized that these findings do not clarify the validity of the behavioral items.—D. Prager.

5113. Kanner, L. **American contributions to the development of child psychiatry.** *Psychiat. Quart. Suppl.*, 1961, 35(1), 1-12.—Historical chronicle of names and events in American child psychiatry.—D. Prager.

5114. Kouretas, D. **Aspects modernes des cures psychothérapiques pratiquées dans les sanctuaires de la Grèce antique.** [Modern aspects of psychotherapeutic cures practised in the sanctuaries of ancient Greece.] *Rev. Franc. Psychanal.*, 1962, 26(2-3), 299-309.—Illness was seen as punishment of divine origin. The limitations of medical science allowed only psychosomatic treatment by the priesthood. Starvation for the induction of trance states, liberal ablutions for purification, diverse fumigations to induce torpor and dreams, suggestion, distractions and games, sleeping in places sacred to the ill and near revered statues, apparitions, oracles, visions, etc., were part of the therapeutic armamentarium.—G. Rubin-Rabson.

5115. Masserman, Jules H. (Ed.) **Science and psychoanalysis. Vol. 5. Psychoanalytic education.** New York: Grune & Stratton, 1962. xi, 332 p. \$9.75.—Theoretical articles on Freud and the history of ideas, on biological sciences and human behavior, on values and truth in psychoanalysis, and on complementarity in psychodynamic theory are followed by articles on psychosomatic and social concepts in psychoanalytic education as well as research and communication processes in psychoanalytic education. Part III includes articles on psychoanalytic supervision; integration of psychiatric and psychoanalytic training; and on duration, perspectives, and lessons of psychoanalytic training. Part IV includes articles on identity values, femininity, and on psychoanalytic therapy as an educational process.—D. Prager.

5116. Rado, S. Towards the construction of an organized foundation for clinical psychiatry. *Comprehen. Psychiat.*, 1961, 2(2), 65-73.—Adaptational psychodynamics, behavioral physiology, behavioral genetics, physiological psychodynamics, ethological dynamics, physiological psychology, experimental psychology, and sociological, anthropological, and historical psychodynamics are all sciences basic to clinical psychiatry. Without psychodynamics, behavioral science has no worthwhile problems, and without physiology, it has no binding solutions. The behavioral physiologists will pick the psychodynamic scheme best suited for psychophysiological correlation.—D. Prager.

5117. Rioch, David M. The sense and the noise. *Psychiatry*, 1961, 24(2, Suppl.), 7-18.—"The field of psychiatry is entering a stage in which it will not be sufficient to learn only a technique of therapy or a system of analyzing behavior. Certain features of behavior are relevant to certain goals, others to other goals, and for any particular goal much that might be done in the name of therapy or that might be investigated or measured in the name of research is irrelevant or redundant."—C. T. Morgan.

5118. Studer-Salzmänn, Ulrike. (Ed.) Beiträge zur Diagnostik, Prognostik und Therapie des Schicksals. [Contribution to diagnosis, prognosis and therapy in the analysis of destiny.] *Beih. Schweiz. Z. Psychol. Anwend.*, 1962, No. 43. 280 p.—The 2nd Colloquium of the International Society for Research in the Psychology of Destiny is reported in 27 papers representing 9 countries. In Section I on therapy and prognosis, an 83% success rate in Szondi predictions is reported. Drive diagnosis (Section II) is treated statistically, particularly with regard to retardation. Sections III and IV contain highly speculative papers on psychosomatics, energetics, and cybernetics.—J. C. Brengelmann.

5119. Vance, Forrest L., & Volsky, Theodore C., Jr. (U. Minnesota) Counseling and psychotherapy: Split personality or siamese twins? *Amer. Psychologist*, 1962, 17(8), 565-570.—Psychotherapy is a process "implemented by interview techniques which seeks to alter the client's receptor or response system in such a way that healthy behavior will occur in situations where unhealthy behavior has been typical." An attempt will be made "to describe a kind of nonpathological emotional distress that is clearly the special province of the counseling psychologist." We "see psychotherapy and at least one type of counseling, psychological discordance reduction, as Siamese twins. These processes are two distinct but closely related entities that share some vital concerns. Perhaps one of both of these twins have split personalities, but the distinction between them is not delusional."—S. J. Lachman.

MEDICAL THERAPIES

5120. Bolter, Sidney. The psychiatrist's role in therapeutic abortion: The unwitting accomplice. *Amer. J. Psychiat.*, 1962, 119(4), 312-316.—Psychiatrists have no more right to break the law than any other citizen. They should remember this when called upon as consultants to make decisions concerning therapeutic abortion. They should consider grounds for contraindications rather than for indica-

tions to therapeutic interruption of pregnancy.—N. H. Pronko.

5121. Gruvstad, Mats; Kebbon, Lars, & Löf, Bengt Ax:son. (U. Uppsala, Sweden) Changes in mental functions after induced hypotension: Immediate and late effects of operations under hypotensive anesthesia on cerebral functions. *Acta psychiat. Scand., Copenhagen*, 1962, 37(Suppl. No. 163), 112 p.—Hypotensive anesthesia causes more impairment in mental functions than normotensive anesthesia, both on psychometric and psychiatric assessment. The degree of the impairment is dependent to a certain extent on the degree and duration of the induced hypotension. Functions involving mental speed and ability to shift seem to be most affected. The deterioration is small in comparison with the mental reactions which always follow major operation. A slight amount of deterioration can still be detected in some psychometric results a year or more after the operation. The impairment in mental functions after induced hypotension does not seem to have any effect of practical importance on the S's adjustment to society, working capacity, or subjective well being. These conclusions are based on 93 patients with herniation of lumbar discs; of these 32 were operated under hypotensive anesthesia using thimethaphan, 39 had had normotensive anesthesia, and the rest were unoperated controls. Extensive case reports are included. (150 ref.)—R. Kaelbling.

Drug Therapy

5122. Azima, H., Vispo, R. H., & McKenna, R. Anaclitic therapy induced by drugs. *Comprehen. Psychiat.*, 1961, 2(5), 281-293.—Anaclitic therapy including prolonged drug-induced light sleep aims to produce a massive and rapid regression to infantile, particularly oral, modes of object relations. The 2 parameters of technique are healthy mothering gratifications offered plus anaclitic interpretations. 10 patients studied from 2 to 4 years were 3 ulcerative colitis, 1 peptic ulcer, 1 asthma, and 5 psychoneurotics with a predominance of anxiety. Anaclitic therapy was a last resort. Except for one of the psychoneurotics and the asthmatic, all showed moderate to marked improvement on anaclitic therapy. The peptic ulcer patient is presented in detail to demonstrate the technique.—D. Prager.

5123. Bakker, C. B., & Amini, F. B. Observations on the psychotomimetic effects of sernyl. *Comprehen. Psychiat.*, 1961, 2(5), 269-280.—1 group consisted of 5 psychiatrists, 1 psychologist, and 1 graduate art student. A 2nd group consisted of 25 carefully selected prisoners. Placebo controls were used. Sernyl slowed thinking, changed body image and perceptions of outside world, resulting in stereotyped behavior, and impaired concentration and the ability to react actively to incoming stimuli. With toxic doses, catatonic-like stupor is produced. Direct comparison of model psychoses and spontaneous psychoses is not fruitful, but the use of drugs for investigation of CNS function and its behavioral correlates appears promising.—D. Prager.

5124. Björklund, Stig. (Sidsjön Hosp., Sundsvall, Sweden) Examens cliniques-chimiques de malades traités par la lévomépromazine (nozinan). [Clinical and chemical examinations of patients treated with levomepromazine (nozinan).] *Encephale*,

1962, 51(2), 181-197.—Clinical results are presented on 3 groups of patients: (a) 35 cases which were minutely examined for somatic complications, (b) 34 cases treated continuously for 11 months, and (c) a general group of 704 patients treated during the year. Only 2 cases of granulocytopenia were produced, and no symptoms of severe hepatic lesions were observed. No renal complications were observed. Moderate symptoms of Parkinsonism were observed in 2 cases. (17 ref.)—*W. W. Meissner*.

5125. Brooks, G. W., & Weaver, L. A., Jr. Some relations between psychiatric and psychomotor behavior changes associated with tranquilizing medications. *Comprehen. Psychiat.*, 1961, 2(4), 203-210.—26 severely and chronically disturbed schizophrenic women were placed successively on placebo, an experimental tranquilizer (SU-3822), trifluoperazine, and trifluoperazine plus antiparkinsonism agents. Psychiatric status steadily deteriorated under placebo and SU-3822 but improved with the trifluoperazine and antiparkinsonism medication. Reaction time tests and steadiness tests were sensitive to changes in psychiatric status but did not reflect the effects of the muscular dysfunction. On the other hand, the pursuit rotor, pegboard, and horizontal alternation tests were not sensitive to change in psychiatric status but did indicate effects resulting from muscular dysfunction.—*D. Prager*.

5126. Busfield, B. L. Jr., & Wechsler, H. (Massachusetts Mental Health Cent., Boston) Salivation rate: A physiologic correlate of improvement in hospitalized depressed patients treated with 3 antidepressant medications. *Psychosom. Med.*, 1962, 24(4), 337-342.—68 severely depressed hospitalized psychiatric patients were assessed independently by 2 psychiatrists. Each S was randomly assigned to a 4-8 week treatment of marplan, nardil or tofranil using a double-blind procedure. Those who improved had a higher pretreatment salivation rate, by the cotton dental role technique. Subjective perception of dry mouth does not correlate with treatment outcome.—*W. G. Shipman*.

5127. Dedieu-Anglade, G. Expérimentation du 3-3 pentaméthylène-4-hydroxybutyrate de sodium (S. 186). [Investigation of sodium 3, 3-pentaméthylène-4-hydroxybutyrate (S. 186).] *Encephale*, 1962, 51(2), 149-165.—The physical properties, toxicology, pharmacodynamics, and experimental results of the stimulating effect of S. 186 on the CNS are described. Clinical effectiveness is reviewed and the results of 28 cases (23 improved) are reported. The drug is effective in depressions, producing greater intellectual efficiency, a feeling of physical well-being, and permitting greater emotional control. The drug is classified as a thymoanaleptic, with action similar to that of imipramine. (16 ref.)—*W. W. Meissner*.

5128. Freyhan, F. A. On classifying psycho-tropic pharmaca. *Comprehen. Psychiat.*, 1961, 2(5), 241-247.—Classifications proposed by Delay and Kline are discussed. Delay distinguishes the psycholeptics as including hypnotics, neuroleptics, and tranquilizers. The psycholeptics depress mental activity. The psychoanaleptics which stimulate mental activity include drugs which are antihypnotic such as amphetamines and drugs which elevate and regulate mood level such as imipramine and MAO-inhibitors. Finally, the psychodysleptics are drugs causing devia-

tions of mental activity such as delusional aberrations, dream states, hallucinations, confusion, etc. Kline's classification consists of psychoinhibitors, psycho-activators and psychotomimetics. Freyhan submits that Delay's classification be adapted as the basic model for further consideration.—*D. Prager*.

5129. Lang, A., & Laroche, B. Réflexions sur l'utilisation du traitement au majoétil en milieu psychiatrique musulman. [Reflections on treatment with majoétil in Moslem psychiatry.] *Encephale*, 1962, 51(2), 166-180.—Treatment of 85 male Moslems (18-46 years old), suffering from a variety of neurotic and psychotic syndromes, with thioproperazine resulted in several side-effects, namely acceleration of pulse, hypothermia, hypotension, and hyper-sudation. Detailed observations of 2 cases with fatal outcome are included. Thioproperazine has a marked anti-psychotic activity, which is most effective and rapid deliria and chronic hallucinatory states, and most spectacular in hysteria.—*W. W. Meissner*.

5130. Pauk, Z. D., & Shagass, C. Some test findings associated with susceptibility to psychosis induced by lysergic acid diethylamide. *Comprehen. Psychiat.*, 1961, 2(4), 188-195.—Of 14 psychiatric patients receiving at least 3 doses of LSD, up to 9 micrograms per kilogram per dose, only 7 showed psychosis. Susceptibility to the LSD psychosis seemed to be reflected chiefly in early disturbance of performance in drawing tasks.—*D. Prager*.

5131. Pravdina-Vinarskaia, E. N., & Rudaia, G. B. (Inst. Neurosurgery, USSR Acad. Medical Sciences) Vosstanovitel'noe obuchenie pri narusheniakh gnostiko-prakticheskikh i rechevykh funktsii i "rastormazhivaiushche" lechenie galantaminom. [Rehabilitation training in cases of agnosic, apraxic, and aphasic dysfunctions and "disinhibitory" therapy with galantamine.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 6, 113-116.—19 adult Ss (no age reported) were administered, during rehabilitation training, different doses of galantamine. The effect was a general improvement in Ss' attitudes and dispositions. The drug seems to be acting both on the cortex and on the reticular formation.—*A. Cuk*.

5132. Roulet, Norman; Alvarez, Robert R., Duffy, J. Patrick; Lenkoski, L. Douglas, & Bidder, T. George. (University Hosp., Cleveland, O.) Imipramine in depression: A controlled study. *Amer. J. Psychiat.*, 1962, 119(5), 427-431.—"The antidepressant drug imipramine was evaluated by means of a double blind study. Therapeutic results were assessed on the basis of a rating scale, psychological tests, and clinical course. Differences favoring the drug were found in some of the psychological tests, but in no clinical area were there significant differences between drug and placebo."—*N. H. Pronko*.

5133. Sundararaj, N. (All-India Inst. Mental Health) Some features of drug use among mental patients. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 78-83.—A comparative study of a group of drug users with psychiatric symptoms with a group of mental patients not using drugs. Factors of age, economic status, occupation, marital status, etc., were considered. Patients using drugs episodically seemed to be more prone to suicidal attempts. Drug use was more in the married class and in the group of pa-

tients drawn from the illiterate class. The patients in the 4th and 5th decades showed a predilection to drug use. Patients using drugs seemed to be mostly in the labor and miscellaneous groups. Drug use was more common among the nonschizophrenic patients.—*J. DiGiovanni.*

5134. Waldrop, F. N., Robertson, R. H., & Vourlekis, A. A comparison of the therapeutic and toxic effects of thioridazine and chlorpromazine in chronic schizophrenic patients. *Compreh. Psychiat.*, 1961, 2(2), 96-105.—2 groups of 71 females each, similar in age, duration of hospitalization, and symptoms, were treated with mellaril and thorazine for 13 weeks. The actions of the 2 drugs on symptoms and behavior of these patients was very similar. Side effects were also similar except for more severe extrapyramidal symptoms in the group on thorazine. Both groups showed significant improvement in symptoms and ward behavior as rated by psychiatrists and nurses.—*D. Prager.*

5135. Whitman, R. M., Pierce, C. M., Maas, J. W., & Baldridge, B. Drugs and dreams: II. Imipramine and prochlorperazine. *Compreh. Psychiat.*, 1961, 2(4), 219-226.—10 volunteer Ss were used. Imipramine significantly decreased the number of dreams per night and significantly increased the expression of hostility per word of dreams. Compazine increased the expression of heterosexuality and phenobarbital increased the expression of homosexuality in dreams. All 3 drugs increased the appearance of dependency and anxiety in dreams and decreased intimacy.—*D. Prager.*

5136. Wilcott, R. C., Helper, M. M., & Garfield, Sol. L. (Western Reserve U., Cleveland) Some psychophysiological effects of chlorpromazine on emotionally disturbed children. *J. nerv. ment. Dis.*, 1962, 135(3), 233-238.—The effects of chlorpromazine vs. placebo were studied upon autonomic activity and muscle tension of emotionally disturbed children. Results showed that at the resting level, chlorpromazine gave a decrease in autonomic activity (palmar conductance) and a rise in heart rate. Under aroused conditions the drug had no significant effect on either measure, nor did it have any effect on the resting level or reactivity of frontalis EMG.—*N. H. Pronko.*

5137. Woods, Grace E. (Bristol, England) Double-blind trial of carisoprodol. *Develpm. Med. child Neurol.*, 1962, 4(5), 499-506.—Clinical judgments by the physiotherapist, by the speech therapist, and by the class teacher suggest that, in the 19 children so studied, some improvement attributable to the use of carisopodol, was observed.—*T. E. Newland.*

Shock Therapy

PSYCHOTHERAPY

5138. Baron, F. (Harvard U.) Psychotherapy and creativity. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 26-49.—After discussing the difficulty of doing objective research in psychotherapy and expressing his reluctance to interfere with the process to get information, the author states that the same problem exists in research on creativity. He then refers

briefly to mushrooms and psilocybin as means of freeing oneself from restrictions and becoming creative.—*B. T. Jensen.*

5139. Berna, Jacques. Die Indikation zur Kinderanalyse. [Indications for child analysis.] *Psyche, Stuttgart*, 1962, 16(2), 81-99.—These factors are important in determining the suitability of a child for psychoanalysis: symptom picture, personal and family history, developmental level, relative ego strength, transference potential, test findings, transference potential of parents, attitudes of the analyst, his countertransference control, and a trial analysis.—*E. W. Eng.*

5140. Brown, Charles T. (Western Michigan U.) Introductory study of breathing as index of listening. *Speech Monogr.*, 1962, 29(2), 79-83.—A psychotherapist's respiration responds to respiration changes of his patient. Other studies indicate relations between listening and breathing. The tested hypotheses were (a) a good listener would tend to imitate a speaker's breathing characteristics more than a poor listener and (b) listening breathing would differ in rate, depth, variability, and form from vegetative and speaking breathing. 6 good listeners and 8 poor listeners were selected on the basis of the Educational Testing Service Test of Listening and 2 other tasks. Each of the Ss listened to a speech independently; and pneumographs gave polygraphic recordings of abdominal breathing while listening and, on some Ss, while taking a test. The 1st hypothesis was not supported; the 2nd was.—*D. Lebo.*

5141. Chen, Chu-Chang. (National Taiwan U. Hosp., Taipei, Taiwan) Therapeutic effects of spontaneous patient subgroups formed on a state hospital ward. *Int. J. group Psychother.*, 1962, 12(3), 301-311.—"An investigation of the composition of subgroups and of inter-subgroup relationships was carried out for a period of twenty months on a male closed ward in a state hospital. The geographical locations chosen by the subgroups mirrored, to a large extent, the clinical pictures of their members. The shifting of a patient's location from one area to another could be an important indicator of change in his psychological state, and in most cases reflected 'upward mobility,' i.e., toward subgroups of patients presenting the better clinical picture."—*L. N. Solomon.*

5142. Cohen, Robert A., & Cohen, Mabel Blake. Research in psychotherapy: A preliminary report. *Psychiatry*, 1961, 24(2, Suppl.), 46-61.—"We scrutinized the first ten hours of treatment by breaking the material down into interchanges, and studied them from a number of points of view, including the actual historical material brought forth, the development of the relationship between patient and therapist, the effect of various types of behavior of each upon the other, and the effects of the psychoanalytic approach on the structure and meaning of the therapeutic relationship. . . . [The] level of anxiety in the patient was paralleled by the degree of responsiveness in the therapist. . . . [The] patient's responses to the therapist were meaningfully related to the kind of communication he made, in terms of the degree to which they accepted or attacked his defenses. . . . We were impressed by the great amount of information given by the patient during the early hours, and the striking contrast between this and the amount of

use which could be made of it therapeutically."—C. T. Morgan.

5143. Daniels, Robert S., & Prosen, Harry. (U. Chicago) The contribution of visual observation to the understanding of an interview. *Int. J. group Psychother.*, 1962, 12(2), 230-239.—"Interviews were observed by a small group through a one-way viewing screen without sound. . . . Statements by the observers could be organized in three categories: (a) the use of the physical setting by patients and therapists, (b) the characteristic physical appearance and the behavioral traits of the patients and therapists, and (c) the interpersonal relationship between patients and therapists. . . . This technique is a valuable training and research tool."—L. N. Solomon.

5144. Dibner, Andrew S., Palmer, Robert D., & Cohen, Benjamin. (VA Mental Hygiene Service, Boston, Mass.) Screening for psychotherapy by an open-ended group. *Int. J. group Psychother.*, 1962, 12(3), 373-374.—Patients enter an open-ended group on a trial basis before deciding upon further individual or group therapy. It was found that those who had this initial experience stayed in treatment 50% longer than did control patients.—L. N. Solomon.

5145. Frey, Louise A. Support and the group: Generic treatment form. *Soc. Wk.*, 1962, 7(4), 35-42.—A description of various ways in which patients in group therapy can profitably receive support from the therapist and from the group.—G. Elias.

5146. Garfield, S. L., & Affleck, D. C. (U. Nebraska Coll. Medicine) Therapists' judgments concerning patients considered for psychotherapy. *J. consult. Psychol.*, 1961, 25(6), 505-509.—Therapists agree highly on judgment of prognosis, personal feelings towards patients, and interest for taking patients on for psychotherapy. In listing assets of patients only 5 assets predominate. Patients remaining in therapy were rated as having a better prognosis. Ratings of preference and personal feelings are not related to actual duration of stay.—E. R. Oetting.

5147. Getter, H., & Sundland, D. M. (Columbus Psychiatric Clinic, O.) The Barron Ego Strength scale and psychotherapeutic outcome. *J. consult. Psychol.*, 1962, 26(2), 195.—Es correlates with age and sex but not with improvement, hours in therapy, or acceptance of treatment, for an outpatient psychiatric group. Findings contradict Barron (see 28: 6072).—E. R. Oetting.

5148. Gottesman, L. E. (U. Chicago) The relationship of cognitive variables to therapeutic ability and training of client centered therapists. *J. consult. Psychol.*, 1962, 26(2), 119-125.—2 groups of clinical psychologists (one in therapy training, another training in projective test analysis) categorize client statements on a modification of the Role Construct Repertory Test. Permeability (applying of constructs) and complexity (number of constructs) relate to judgments of therapeutic ability. The use of common constructs was greater in the therapy group, increased with training, and is negatively related to complexity. Agreement on concepts decreased with training.—E. R. Oetting.

5149. Howe, E. S. (U. Maryland School Medicine) Anxiety-arousal and specificity: Rated correlates of the depth of interpretive statements.

J. consult. Psychol., 1962, 26(2), 178-184.—48 psychiatrists rate 62 interpretive responses on 1 of 5 scales: Depth of Interpretation, Specificity, Anxiety-Arousal, and Implausibility are positively interrelated and reliable. Therapeutic Skillfulness is unrelated and not reliable.—E. R. Oetting.

5150. Kahn, Eugene. (Baylor U.) The past is not past. Springfield, Ill.: Charles C Thomas, 1962. 66 p. \$3.75.—20 essays concerning an individual's, particularly a patient's, experiencing of the past. The present and future stand upon an individual's past, and each individual is retrospectively changing some aspects and experiences of his past.—C. T. Morgan.

5151. Konstorum, S. I. Opyt prakticheskoi psikhoterapii. [An account of practical psychotherapy.] Moscow, USSR: State Institute of Psychiatry, 1962. 224 p.—This posthumous edition is devoted to a consideration of general psychotherapy and special topics therein. In the former, therapies discussed are restricted to the suggestive, hypnotic, and rational. The latter includes discussions of psychotherapy in schizophrenia, psychasthenic and hysterical reactions, occupational neuroses, sexual disorders, and alcoholism.—I. D. London.

5152. Kors, Pieter C. The existential moment in psychotherapy. *Psychiatry*, 1961, 24(2), 153-162.—A discussion of some of the differences between Freudian and existential psychiatry.—C. T. Morgan.

5153. Kubie, Lawrence S. Is preventive psychiatry possible? *Daedalus*, 1959, 88(4), 646-668.—The author concludes in the affirmative, but the tasks involved in making preventive psychiatry an actuality are considerable and are not open to any easy solutions. Primary among the difficulties to be encountered are (a) socially entrenched prejudices which feed on the neurotic process and which lead to some aspects of society being highly prized even though they support the neurotic process, (b) the limited availability of sensitive diagnostic and therapeutic techniques which can be applied early and of practitioners to apply them, and (c) the limited knowledge concerning means of reorganizing family structures and educational systems so that they do not reinforce the neurotic process.—K. E. Davis.

5154. LeShan, Lawrence, & LeShan, Eda. Psychotherapy and the patient with a limited life span. *Psychiatry*, 1961, 24(4), 318-323.—Therapy with patients dying with cancer, and the reluctance of therapists to treat such patients, is discussed.—C. T. Morgan.

5155. Lüders, W. Grundaspekte der psychologischen Behandlung. [Basic aspects of psychological treatment.] *Psychol. Rdsch.*, 1962, 13(3), 180-191.—The essential difficulty of psychological treatment lies in the fact that only the client knows the pathogenesis of his behavior. However, learning to understand the client's behavior through his own set of values is still not sufficient in helping him. This can only be achieved if the therapist is also capable of guiding the patient efficiently toward the therapeutic goal. The criterion for psychotherapeutic achievement is the competence of interaction in the social field.—W. J. Koppitz.

5156. Masserman, J. H. (Ed.) Current psychiatric therapies. Volume 2. New York: Grune &

Stratton, 1962, xi, 289 p. \$8.75.—A review of diagnoses, advances, and new schools of psychotherapy is followed by articles on child psychotherapy, brain-damaged children, and the George Junior Republic. Under techniques of psychotherapy are articles on the anaclitic factor, activity in psychotherapy, hypnosis, Adlerian techniques, countertransference, negative therapeutic reaction, the blind, and the management and treatment of the dying patient. The remaining sections are on the treatment of psychoses, legal psychiatry, part-time psychiatric services, full-time hospital therapy, and finally on psychiatry and the world order.—D. Prager.

5157. Nand, D. Satya. The methods of total psychoanalysis. *Pratibha*, 1959, 2(1), 1-4.—Total psychoanalysis uses all the psychological, psychiatric, and psychoanalytic methods of investigation and therapy. It requires the S to carry 3 cards in his pocket—biographical card, experience card, and research card. Total psychoanalysis emphasizes the dysnoia state of anguish. "Total psychoanalysis has the basic radical depth and total psychoanalytic processes of the phylogenetic dimension as well as the entomorphic, ectomorphic and totimorphic psychophysical parallel field states of the ontogenetic dimension. Soul-analysis has also to be studied. It studies all these field states and their content on the basic assumption of religion or religiosity."—U. Pareek.

5158. Opitz, E. Psychotherapie im höheren Lebensalter. [Psychotherapy at advanced age.] *Psychol. Rdsch.*, 1962, 13(4), 241-255.—Specific techniques of treating neurotic difficulties usually centered around apprehension of death are discussed. Death anxiety is seen as masked greed for life; a firm guidance of the therapist is advocated to direct the patient in a critical analysis of his thinking and behavior patterns in order to resolve this anxiety.—W. J. Koppitz.

5159. Rosenbaum, Max, & Hartley, Eugene. (Ass. Group Psychoanalysis) A summary review of current practices of ninety-two group psychotherapists. *Int. group Psychother.*, 1962, 12(2), 194-198.—The results of a questionnaire administered at the 16th Annual Conference of the American Group Psychotherapy Association are presented.—L. N. Solomon.

5160. Sargent, Helen D. Intrapsychic change: Methodological problems in psychotherapy research. *Psychiatry*, 1961, 24(2), 93-108.—The paper discusses problems of: process and outcome, reality, epistemology, calibration of the judge, and reliability and validity. "The research problem lies in developing more psychologically sophisticated concepts of objectivity and of the levels at which controls should be applied in relation to different problems. . . . In psychotherapy research, judgments may be discovered to have increased predictive utility when released from structures imposed by arbitrary unitization, the quest for unidimensionality, and control at the level of observation."—C. T. Morgan.

5161. Tomlinson, T. M., & Hart, J. T., Jr. (U. Wisconsin) A validation study of the Process Scale. *J. consult. Psychol.*, 1962, 26(1), 74-78.—Rating of taped interviews with the Process Scale shows higher scores for successful cases at the beginning and end of therapy. For successful cases the

2nd ½ of the interview tends to rate higher than the 1st ½.—E. R. Oetting.

5162. Waskow, I. E. (U. Maryland School Medicine) Reinforcement in a therapy-like situation through selective responding to feelings or content. *J. consult. Psychol.*, 1962, 26(1), 11-19.—In 3 groups of Ss the therapist selectively reinforced content, feeling, and feeling-content responses with psychology students as Ss. The content group shows major change with the 1st ½ of the 1st interview; others show no clear effects.—E. R. Oetting.

5163. Winder, C. L., Ahmad, F. Z., Bandura, A., & Rau, L. C. (Stanford U.) Dependency of patients, psychotherapists' responses, and aspects of psychotherapy. *J. consult. Psychol.*, 1962, 26(2), 129-134.—Therapists' behavior is evaluated with parents of emotional or adjustment problem children. Where expressions of dependency are approached, patient remains in treatment and frequency of dependency expression is sustained or increases. If avoided, frequency decreases and the patient terminates. The form of expression by terminators and remainers may differ. Expressions of hostility also vary with therapist approach or avoidance.—E. R. Oetting.

Therapeutic Processes

5164. Cain, Albert C., & Maupin, Barbara M. (U. Michigan Medical Cent.) Interpretation within the metaphor. *Bull. Menninger Clin.*, 1961, 25(6), 307-311.—Some limits, complications, and countertransference potentials of the therapeutic technique of making conscious metaphoric use of the psychotic child's regressed language are indicated.—W. A. Varvel.

5165. Carson, R. C., & Heine, R. W., (Duke U.) Similarity and success in therapeutic dyads. *J. consult. Psychol.*, 1962, 26(1), 38-43.—Extreme similarity or dissimilarity on patient-therapist MMPI profile shape impedes therapy. A theoretical discussion is given.—E. R. Oetting.

5166. Deane, William N., & Ansbacher, Heinz L. Attendant-patient commonality as a psychotherapeutic factor. *J. indiv. Psychol.*, 1962, 18(2), 157-167.—The commonality of background and language and his close associations with patients contribute materially to the therapeutic value of the attendant. Suggestions for implementing the latter's role are offered.—A. R. Howard.

5167. Frank, G. H., & Sweetland, A. (U. Miami) A study of the process of psychotherapy: The verbal interaction. *J. consult. Psychol.*, 1962, 26(2), 135-138.—Clarification of feeling responses forcing insight responses by the therapist led to marked increase in understanding responses and insight responses. Interpretation increased understanding and insight and decreased statements about problems; the reverse was true of direct questions. ". . . there is a consistent relationship in the sequence of client-therapist statements."—E. R. Oetting.

5168. Howe, E. S., & Pope, B. (U. Maryland School Medicine) An empirical scale of therapist verbal activity level in the initial interview. *J. consult. Psychol.*, 1961, 25(6), 510-520.—2 parallel scales for assessing the activity level of discrete therapist verbal responses are developed and evaluated with a number of different types of raters and of

materials. Theoretical implications of the differences found are discussed. The median of 112 reliability coefficients is .50.—E. R. Oetting.

5169. Howe, E. S., & Pope, B. (U. Maryland School Medicine) **Therapist verbal activity level and diagnostic utility of patient verbal responses.** *J. consult. Psychol.*, 1962, 26(2), 149-155.—Ratings are made of the diagnostic utility of statements of patients in therapy with 4 different therapists. The rating is significantly related to the number of clauses in the response. Activity level of the therapist may be related to number of clauses. The Rogerian interview was rated less reliably than the non-Rogerian interview.—E. R. Oetting.

5170. Link, S. Gordden. (Washington, D. C.) **Influence of cultural factors on process and product of therapy.** *J. Amer. Soc. Psychosom. Dent. Med.*, 1962, 9(4), 92-106.—A brief analysis of the literature, of a questionnaire response, and of actual clinical experience shows the greatest number of successful results to occur in cases where there were similarities between patient and therapist in social and cultural factors.—J. H. Manhold, Jr.

5171. Sechrest, Lee. (Northwestern U.) **Stimulus equivalents of the psychotherapist.** *J. indiv. Psychol.*, 1962, 18(2), 172-176.—Role Construct Test data from 35 psychotherapy patients do not support the Freudian view of transference. It is more probable that the therapist will be likened to the family physician and minister than to some family member.—A. R. Howard.

5172. Shatan, Chaim F., Brody, Benjamin, & Ghent, Emanuel R. (Coll. City New York) **Countertransference: Its reflection in the process of peer-group supervision.** *Int. J. group Psychother.*, 1962, 12(3), 335-346.—It is hypothesized that, unconsciously, the therapist maneuvers his patients into roles which best fit his own needs and that he integrates his defenses against anxiety with complementary or corresponding defenses in his patients. It is suggested that peer-group supervision may make an important contribution to the student's awareness in this domain.—L. N. Solomon.

5173. Strupp, H. H. (U. North Carolina) **Some recent research on the psychotherapist's contribution to the therapeutic process.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical Psychology* (see 37: 4119). Pp. 89-98.—The article presents some examples of research and illustrates influence through communication.—B. T. Jensen.

5174. Weigert, Edith. **Die Rolle der Sympathie in der Psychotherapie.** [The role of sympathy in psychotherapy.] *Psyche, Stuttgart*, 1962, 16(3), 209-220.—The creative understanding of the patient develops from the therapist's sympathy, a more developed form of empathy. In sympathy there is a concern for the other as an individual that extends beyond the emotional contagiousness of primitive empathy. Genuine sympathy enables dissolution of the patient's masks as the therapist accompanies the patient in his struggle to accept his life as it must be for him.—E. W. Eng.

Group Therapy

5175. Anker, J. M., & Walsh, R. P. (VA Hosp., Perry Point) **Group psychotherapy, a special ac-**

tivity program, and group structure in the treatment of chronic schizophrenics. *J. consult. Psychol.*, 1961, 25(6), 476-481.—A special activity group involving the production of plays led to significant changes on the MACC Behavioural Adjustment Scale. Group psychotherapy showed minor positive results and group structure was not related. Measures of group cohesion and social choice show no change.—E. R. Oetting.

5176. Bassin, Alexander, & Smith, Alexander B. (Yeshiva U.) **Verbal participation and improvement in group therapy.** *Int. J. group Psychother.*, 1962, 12(3), 369-373.—No significant relationship was found between amount of talking in group therapy sessions and extent of change (or "improvement") on 2 evaluation instruments.—L. N. Solomon.

5177. Berger, Milton M. (American Group Psychotherapy Ass.) **An overview of group psychotherapy: Its past, present and future development.** *Int. J. group Psychother.*, 1962, 12(3), 287-294.—A brief review of the past and present concerns of group psychotherapists and some suggestions for future activities of the members of the American Group Psychotherapy Association.—L. N. Solomon.

5178. Berzon, Betty. (Western Behavioral Sciences Inst., La Jolla, Calif.) **Residual parental threat and selective interaction in group psychotherapy.** *Int. J. group Psychother.*, 1962, 12(3), 347-354.—The prediction that individuals would initiate interaction in group therapy with other group members on the basis of perceived similarity to their more threatening parent is not supported by the data of this study.—L. N. Solomon.

5179. Bloch, C. (72 Ave. Louis Lepoutre, Brussels, Belgium) **Psychothérapie par groupes de discussion chez des malades mentaux hospitalisés.** [Psychotherapy through group discussion with hospitalized mental patients.] *Acta neurol. psychiat. Belg.*, 1962, 62, 264-278.—This paper discusses the relevance, problems, and efficacy of group psychotherapy.—V. Sanua.

5180. Block, S. L. **Multi-leadership as a teaching and therapeutic tool in group psychotherapy.** *Comprehen. Psychiat.*, 1961, 2(4), 211-218.—The chief disadvantage arises from the competitiveness of the 2 leaders. The advantages are a decrease in anxiety of trainee therapists, enhancement of perception of group events, closer approximation of the 2-parent family model, demonstrates to patients constructive resolution of differences between leaders, and aids the trainee in resolving his countertransference problems.—D. Prager.

5181. Boas, Conrad van Emde. (Marriage Guidance Clinic, Amsterdam, Holland) **Intensive group psychotherapy with married couples.** *Int. J. group Psychother.*, 1962, 12(2), 142-153.—This report of intensive, analytically oriented group psychotherapy with 7 couples over more than 2 years, without impossibly complicated transference reactions occurring, demonstrates that the contraindications to simultaneous treatment of husband and wife, although fully justified in individual psychoanalysis, cannot be applied to analytic group psychotherapy.—L. N. Solomon.

5182. Bock, J. Carson. (Workmens Compensation Board Hosp., Downsview, Canada) **Self-orient-**

tation to others during non-directive group psychotherapy. *Med. Serv. J.*, 1961, 17(2), 111-117.—This study attempts to measure both the direction and the quality of verbal interaction among psychoneurotics undergoing group therapy in an attempt to discover whether differences and changes in either are related to an index of improvement. 2 experiments were carried out. The findings suggest support for the ideas: (a) that neuroticism reflects a deficiency in warm human relationships and (b) that improvement in mental health goes hand in hand with increased interest in others.—*Author abstract.*

5183. Bugental, J. F. T. (Psychological Service Ass., Los Angeles, Calif.) **Five paradigms for group psychotherapy.** *Psychol. Rep.*, 1962, 10, 607-610.—In an attempt to clarify terminology, 5 types of group psychotherapy are described: process-centered, activity-projects, interpersonal discussion, expressive-projective, and analytic. Typical activities, therapist functions, patient's role, and values of each are discussed.—*B. J. House.*

5184. Flint, Arden A., Jr., & MacLennan, Beryce W. (National Inst. Mental Health) **Some dynamic factors in marital group psychotherapy.** *Int. J. group Psychother.*, 1962, 12(3), 355-361.—An analysis of 6 groups composed of married couples reveals that the presence of the marital partner significantly alters the group dynamics, focus of therapy, transferences, resistance, and outcome. Types of patients who have responded well to marital group therapy are listed and a particular types of marriage found not to be amenable to this type of therapy is described.—*L. N. Solomon.*

5185. Handlon, Joseph H., & Parloff, Morris B. (National Inst. Ment. Health) **The treatment of patient and family as a group: Is it group psychotherapy?** *Int. J. group Psychother.*, 1962, 12(2), 132-141.—The family therapy group does not meet some of the conditions of conventional group therapy which are presumed to be important contributors to the latter's therapeutic efficacy. Whether the failure to meet all the conditions of the conventional therapy group limits the therapeutic usefulness of the family group is left as an open question.—*L. N. Solomon.*

5186. Hulse, Wilfred C. (Mt. Sinai Hospital, N. Y.) **Communalization as an active psychotherapeutic group process.** *Int. J. group Psychother.*, 1962, 12(2), 225-229.—An example of the process of "communalization" is presented in which the therapist allows a conflict to be worked through in the group which has important therapeutic meaning for a majority of the group members.—*L. N. Solomon.*

5187. Jackson, James. (Ass. Medical Group Psychoanalysts) **A family group therapy technique for a stalemate in individual treatment.** *Int. J. group Psychother.*, 1962, 12(2), 164-170.—"A frequent reason for a therapeutic impasse can be found in the anchorage of an individual's neurosis in a complementary or marriage neurosis. A case is reported in which the primary patient's marriage partner was introduced into the individual psychotherapy session" with seemingly beneficial results.—*L. N. Solomon.*

5188. Leichter, Elsa. (Jewish Family Service, NYC) **Group psychotherapy of married couples' groups: Some characteristic treatment dynamics.** *Int. J. group Psychother.*, 1962, 12(2), 154-163.—The dynamic value of various reactions of the spouse to

the mate's treatment experience in a married couples group is discussed. Topics center on the partner as alter or auxiliary ego, reactions to change in mate, and the diminishing of symbiotic marital ties.—*L. N. Solomon.*

5189. Lindt, Hendrik, & Pennal, Hugh A. (U. Texas, Galveston) **On the defensive quality of groups: A commentary on the use of the group as a tool of control reality.** *Int. J. group Psychother.*, 1962, 12(2), 171-179.—Belonging to a group tends to reinforce the individual's mechanism of defense against anxiety, which, in turn, facilitates psychiatric rehabilitation. 3 life situations in which one needs a group in order to function and grow are: (a) in relation to separation anxiety, (b) when there is a quest for identity, and (c) after an impasse has been reached by the individual.—*L. N. Solomon.*

5190. McFarland, Robert L., Nelson, Charles L., & Rossi, Ascanio M. (VA Research Hosp., Chicago) **Prediction of participation in group psychotherapy from measures of intelligence and verbal behavior.** *Psychol. Rep.*, 1962, 11(1), 291-298.—The development of "a practical short screening battery for selection of patients suitable for group psychotherapy" is described. Intercorrelations were obtained among intelligence scores, verbal fluency, a new projective test, 3 tests involving other language functions, and scores on B. C. Finney's Interaction Scale. "Intelligence scores per se were the best predictors of participation in therapy as measured by the Finney scores. . . . Combining such scores on a multiple-correlation regression line with S's score on a new brief analogy test increased the general efficacy of our predictors."—*B. J. House.*

5191. Murthy, H. N. **Group therapy with schizophrenics.** *Pratibha*, 1959, 2(1), 14-19.—An experiment with group therapy shows the usefulness of sociometric measures, observational studies, and content analysis. Cultural background of individuals and its understanding is very important.—*U. Pareek.*

5192. Rome, Howard P. (Mayo Clinic, Rochester, Minn.) **Group psychotherapy: A twenty-year retrospect.** *Int. J. group Psychother.*, 1962, 12(3), 295-300.—A review of the development of group psychotherapy over the past 20 years, with attention to the independent course of several parallel streams of thought.—*L. N. Solomon.*

5193. Rosenthal, Leslie, & Schamess, Gerald. (Jewish Board Guardians) **The group psychotherapy literature: 1961.** *Int. J. group Psychother.*, 1962, 12(2), 240-259.—A summarized review of the literature. (155-item bibliogr.)—*L. N. Solomon.*

5194. Stock, Dorothy, & Lieberman, Morton A. (U. Chicago) **Methodological issues in the assessment of total-group phenomena in group therapy.** *Int. J. group Psychother.*, 1962, 12(3), 312-325.—The existence of shared preconscious fantasies, which are the property of the total group, is hypothesized and these are conceptualized in "focal conflict" terms. The "group focal conflict" is a construct used to conceptualize the events of a particular therapy session in terms of a preconscious conflict between 2 opposing motives, together with various attempts to find a solution to the conflict. Methodological problems concerning procedures, agreement among independent analyzers, and the validity of formulations are discussed.—*L. N. Solomon.*

5195. **Strean, Herbert S.** (State U. New York) **On introducing the new member.** *Int. J. group Psychother.*, 1962, 12(3), 362-368.—Through the use of clinical illustrations, a review is made of the multiple transference phenomena that were stimulated by the introduction of a new member into a group at different stages in the group's existence and development. Focus is on an examination of the various stratagems utilized in introducing the new member and an evaluation of their relative merits.—*L. N. Solomon.*

5196. **Winic, Charles, & Holt, Herbert.** **Seating position as nonverbal communication in group analysis.** *Psychiatry*, 1961, 24(2), 171-182.—"Seating arrangements, as one dimension of group activity, can be productively observed and utilized, both as a means of therapy and as a subject for research."—*C. T. Morgan.*

5197. **Wolf, Alexander, & Schwartz, Emmanuel K.** (NYC) **Psychoanalysis in groups.** New York: Grune & Stratton, 1962. ix, 326 p. \$8.00.—"The authors attempt to make explicit the concepts and procedures of psychoanalysis developed in the course of working with hundreds of patients of all types covering most of the syndromes, including neurosis, psychosis, and character disorders, in private practice and institutions." The utilization of free association, dreams, and transference are prescribed as the primary therapeutic instruments. Of the great interest is the authors' treatment of the highly controversial subjects of the "alternate group," "permissive groups," and "leaderless groups." The chapters read as follows: "Basic Design," "Structure," "Size," "Other Variables," "The Alternate Session," "Acting Out," "Dreams," "Working Through," "Routine Individual Sessions," "Misuse of the Group," "Values," "An Application," "Synthesis," and "The Future." (149 ref.)—*N. De Palma.*

Special Therapies

5198. **Anzieu, Didier.** **Quelques problèmes posés par la formation dite en profondeur.** [Some problems laid by depth analysis training.] *Psychol. Franc.*, 1962, 7(2), 85-93.—A discussion is given of problems encountered in the application of various methods of group diagnostic work and psychodrama leading to sociopersonal improvement. The "Bethel-methods" developed by the National Training Laboratory are contrasted with those of traditional psychoanalysis.—*C. J. Adkins.*

5199. **Babcock, Patricia; Gross, Dellvina, & Gohl, Azela.** (Anoka State Hosp., Minn.) **Occupational therapy for disturbed adolescents.** *Amer. J. occup. Ther.*, 1962, 16(4), 176-181.—Occupational therapy offers a great deal in the way of psychological support for the disturbed adolescent. It provides a safe and accepting environment in which the occupational therapist can supply understanding, the opportunity for creative effort in which the child may become self-confident, and a sense self-worth and accomplishment. In addition occupational therapy provides vocational and avocational exploratory experiences and an excellent situation for the observation of the patient's behavior in an effectively controlled environment.—*M. A. Seidenfeld.*

5200. **Barrett, Beatrice H.** (Harvard Medical School, Cambridge, Mass.) **Reduction in rate of**

multiple tics by free operant conditioning methods. *J. nerv. ment. Dis.*, 1962, 135(3), 187-195.—A 38-year-old veteran patient with extensive multiple tics of 14 years duration was placed in an operant conditioning situation using a tape loop of white noise as a tic-produced aversive stimulus. Tic-free periods of at least 1.5 seconds duration interrupted the noise which did not recur until the next tic. As a control, periods of continuous music and continuous noise were used. Results showed that this patient's tics "could be reduced in rate by self control, by tic-produced white noise, and by continuous music."—*N. H. Pronko.*

5201. **Conte, William R., & Shimota, Helen E.** (Dept. Institutions, Olympia, Wash.) **The relationship between psychiatry and occupational therapy.** *Amer. J. occup. Ther.*, 1962, 16(3), 119-123.—The outcome of a nationwide opinion survey relative to the degree of effectiveness of occupational therapy as a treatment procedure. The article indicates that considerable importance is attached to this field of professional service, but that psychiatrists and psychiatric hospital administrators tend to value it less than do the professionals who are more intimately involved with occupational therapy and its modalities. It appears to be generally conceded that occupational therapy contributes to improved relationships between therapist and the patient and to the development of group activities leading to socialization. Dissatisfaction is expressed with respect to the relationship between occupational therapists and psychiatric consultants and the lack of on-the-job learning opportunities. Poor communication in inter-professional relationships is considered a significant factor in the current situation.—*M. A. Seidenfeld.*

5202. **Gilliland, Esther G.** **Progress in music therapy.** *Rehabilit. Lit.*, 1962, 23(10), 298-306, 316.—A concise, documented history of the development of music therapy as a profession is given, followed by a brief discussion of the educational and musical prerequisites for a music therapist. Literature relating to the following areas is reviewed: (a) effective use of music in rehabilitation programs, (b) the physiological, psychological, and philosophical effects of music on the whole organism, (c) coordination of music therapy with other types of treatment, (d) uses of music in various types of therapy, and (e) uses of music with various types of patients. (45 ref.)—*W. D. Kerr.*

5203. **Hendrickson, Donna.** (Illinois State Psychiatric Inst., Chicago) **Personality variables: Significant departures of occupational therapists from popular norms.** *Amer. J. occup. Ther.*, 1962, 16(3), 127-130.—Cattell's 16 Personality Factor Test was administered to a small sample of occupational therapists residing in the Chicago area. When compared with the norms for the college population it was found that on 9 of the 16 factors the occupational therapists differed significantly from the norms. The findings indicated that as a group, occupational therapists specializing in psychiatry were warm, friendly, intelligent, aggressive, practical, tough, unpretentious, highly flexible, and broad-minded.—*M. A. Seidenfeld.*

5204. **Luthe, W.** (Medical Centre, 5300 Cote Des Neiges, Montreal, Canada) **Method, research and application of autogenic training.** *Amer. J. clin. Hypn.*, 1962, 5(1), 17-23.—The effects of autogenic

training are diametrically opposed to the effects evoked by stress. The psychophysiologic antagonism between autogenic training and stress indicates the therapeutic range of the method which originated from the work of Oskar Vogt.—*M. V. Kline.*

5205. Merian, Doris. *Phantasiegeschichten in der Kindertherapie.* [Phantasy stories in child therapy.] *Psyche, Stuttgart*, 1962, 16(2), 111-126.—Phantasy helps the child realize his feelings, free himself from feelings of inadequacy, and master anxiety. Usually the child is able to talk about a problem only after he has already mastered it in himself. The phantasy story, initiated and/or encouraged by the therapist, enables him to do this. "Interpretation," in the strict sense of the word, is inappropriate in work with children's narrative phantasies.—*E. W. Eng.*

5206. Perlowitz, H. Some aspects of the psychodynamics of social dancing in relationship to sublimation and regressive behavior. *Psychiat. Quart. Suppl.*, 1961, 35(1), 100-113.—Dancing represents a method of nonverbal abreaction in which each partner acts as a nonverbal analyst substituting moral and amoral needs and at times engaging amoral needs for moral resolution. As the rapport of the dance partners increases a vacillation of transference and countertransference occurs which establishes in each partner a gradual diminution of anxiety against sexual thoughts, impulses, and feelings. Dancing then becomes a sublimating concept, abreacting repressed fears and guilt and resolving the striving toward amoral behavior. Social dancing is a means of adaptational integration, particularly effective for withdrawn Ss. Dancing is thus invaluable in the treatment of the neurotic and psychotic.—*D. Prager.*

5207. Reza, Telma. *Behandlung eines sechs jährigen Kindes mit schizophrener Psychose.* [Treatment of a six year old child with schizophrenia.] *Psyche, Stuttgart*, 1962, 16(3), 197-208.—Description of the psychoanalytic play therapy of a 6-year-old boy diagnosed as schizophrenic. The treatment lasted 13 months with 90 sessions. At termination "the reactions of the patient in everyday life" were "normal and have continued to be so." During therapeutic play Sechehaye's principles of symbolic wish fulfillment were followed.—*E. W. Eng.*

5208. Wadsworth, W. V., Wells, B. W. P., & Scott, R. F. (Cheadle Royal Hosp., Cheshire, England) *The organization of a sheltered workshop.* *J. ment. Sci.*, 1962, 108(Whole No. 457), 780-785.—In planning an industrial therapy unit as adjunctive to the psychotherapeutic program of a hospital, attention must be paid not only to the therapeutic needs of the patients as schizophrenic or other, but also to the physical and other demands of various jobs to be attempted. Mental state and environmental demand must be balanced.—*W. L. Wilkins.*

HYPNOSIS

5209. Ås, Arvid. (U. Oslo, Norway) *A note on distractibility and hypnosis.* *Amer. J. clin. Hypn.*, 1962, 5(2), 135-137.—A note on the mechanism of attention focus and its relationship to hypnosis.—*M. V. Kline.*

5210. Ås, Arvid. *The recovery of forgotten language knowledge through hypnotic age regres-*

sion: A case report. *Amer. J. clin. Hypn.*, 1962, 5(1), 24-29.—Hypnotic recovery of a forgotten language through the use of age regression is discussed in 1 case. Experimental analysis revealed sufficient positive evidence to warrant further studies.—*M. V. Kline.*

5211. Ås, Arvid, & Lauer, Lillian W. (Stanford U.) *A factor-analytic study of hypnotizability and related personal experiences.* *Int. J. clin. exp. Hypn.*, 1962, 10(3), 169-181.—To throw further light on the exclusivity of "primary suggestibility" as reported by other investigators, a factor analysis was performed in a sample of 102 female college students on the basis of the intercorrelations of 23 items of personal experiences earlier shown to be related to hypnotizability, and 19 items from 2 hypnosis scales. No simple factor structure emerged. 2 factors were interpreted: the 1st as a hypnotic factor with special emphasis on the capability to sustain the effect of suggestion over time, and the 2nd as a combination of psychological changeableness and social influenceability. A brief discussion was given of the composite picture of hypnotic susceptibility emerging from the fact that many hypnotic items loaded on both factors.—*C. S. Moss.*

5212. Barber, T. X. (Medfield State Hosp., Mass.) *Hypnotic age regression: A critical review.* *Psychosom. Med.*, 1962, 24(3), 286-299.—A review of the relevant clinical and experimental studies regarding the reports that during hypnotic age regression, Ss manifest some infantile reflex responses and some overt behavioral responses that are not within the range of knowledge of infant or child behavior available, under normal conditions, to the adult. It is concluded that further experiments are needed because control Ss have not been selected on the same basis as have the hypnotized Ss. (69 ref.)—*W. G. Shipman.*

5213. Barber, Theodore X. (Medfield State Hosp., Mass.) *Toward a theory of "hypnotic" behavior: The "hypnotically induced dream."* *J. nerv. ment. Dis.*, 1962, 135(3), 206-221.—An experiment with 8 hypnotized Ss on the nature of dreams under hypnosis suggests that (a) hypnosis does not enhance the ability to interpret dreams, (2) the hypnotic dream is not a duplicate of the spontaneous night dream and (c) "it appears possible that 'dreams' induced by suggestions given to 'deeply hypnotized' Ss may be difficult if not impossible to differentiate from the imaginative productions of non-hypnotized controls who are instructed and appropriately motivated to imagine vividly selected scenes or situations or who are instructed to make up dream-like material."—*N. H. Pronko.*

5214. Boucher, R. G., & Hilgard, E. R. (Stanford U.) *Volunteer bias in hypnotic experimentation.* *Amer. J. clin. Hypn.*, 1962, 5(1), 49-51.—Ss, both male and female, who volunteered for experiments on hypnosis on the basis of a notice in the student newspaper scored significantly higher than Ss from an introductory psychology class who fulfilled part of the class requirement by participating. No sex differences were found. Because of the volunteer bias, as well as other factors in S selection, test norms should be constructed for difference S groups, such as patients coming for treatment.—*M. V. Kline.*

5215. Cheek, D. B. (2000 Van Ness, San Francisco, Calif.) Ideomotor questioning for investigation of subconscious "pain" and target organ vulnerability. *Amer. J. clin. Hypn.*, 1962, 5(1), 30-41.—Some techniques of ideomotor questioning and their values for communication with levels of awareness approximating those where perception and attitude govern physiologic adaptations are discussed.—*M. V. Kline.*
5216. Cheek, D. B. (Children's Hosp., San Francisco, Calif.) Importance of recognizing that surgical patients behave as though hypnotized. *Amer. J. clin. Hypn.*, 1962, 4(4), 227-235.—Until all physicians know the available ways of discovering and correcting the potentially detrimental and even lethal subconscious attitudes of surgical patients, it is possible to bypass some of them by learning some of the characteristics of subconscious thought, and respecting the capacity of the anesthetized patient to hear.—*M. V. Kline.*
5217. Cheek, David B. (2000 Van Ness Ave., San Francisco, Calif.) Some applications of hypnosis and ideomotor questioning methods for analysis and therapy in medicine. *Amer. J. clin. Hypn.*, 1962, 5(2), 92-104.—Utilizing ideomotor activity and hypnosis in combination, it becomes easier to scan accurately and safely, large areas of life experience within the brief periods of time available to the clinician.—*M. V. Kline.*
5218. Crasilneck, Harold B., & Hall, James A. (Dallas, Tex.) The use of hypnosis with unconscious patients. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 141-144.—8 of 10 patients dying of cancer were found to continue a simple motor response to a hypnotic command, even though they revealed no other evidence of interaction with the environment and were considered unconscious by their physicians. Certain theoretical considerations are mentioned.—*C. S. Moss.*
5219. Das, J. P. (Utkal U., Cuttack, India) Learning under conditions of hypnotically induced anxiety and nonanxiety. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 163-168.—The hypothesis that anxiety may serve as a drive in learning situations was tested. Easy and difficult lists of trisyllabic nonsense syllables were learned by 6 somnambulistic Ss under conditions of hypnotically induced high and low anxiety. Level of hypnotically induced anxiety was not found to affect either recall scores nor number of trials to criterion.—*C. S. Moss.*
5220. Dittborn, J. M., & Aristequieta, A. (U. Chile, Santiago) Expectation and spontaneous posthypnotic amnesia: An experimental note. *Amer. J. clin. Hypn.*, 1962, 4(4), 268-269.—The findings, for which time values and electroencephalographic recordings were fixed variables, suggest that only a literal expectation could abolish—and then only partially—a posthypnotic amnesia. Also, they indicate that posthypnotic amnesia as a spontaneous manifestation is a genuine phenomenon which warrants further investigation.—*M. V. Kline.*
5221. Edmonston, William E., Jr. (Washington U. School Medicine, St. Louis) Hypnotic age-regression: An evaluation of role-taking theory. *Amer. J. clin. Hypn.*, 1962, 5(1), 3-7.—Role-taking theory in relation to hypnotic behavior is critically reviewed and found to be an inadequate model for the nature of hypnosis and its effects.—*M. V. Kline.*
5222. Eisele, V. G., & Higgins, J. J. (East St. Louis, Mo.) Hypnosis in educational and moral problems. *Amer. J. clin. Hypn.*, 1962, 4(4), 259-263.—A student counselor, a minister, or a marriage counselor, if properly trained in hypnosis and clinical psychology and working in cooperation with and under the guidance of a physician, can benefit a wide variety of patients.—*M. V. Kline.*
5223. Erickson, Elizabeth M. (32 W. Cypress St., Phoenix 3, Ariz.) Observations concerning alterations in hypnosis of visual perceptions. *Amer. J. clin. Hypn.*, 1962, 5(2), 131-134.—A subjective account and critical comment on hypnosis and visual perception.—*M. V. Kline.*
5224. Giles, Eugene. (U. Idaho) A cross-validation study of the Pascal technique of hypnotic induction. *Int. J. clin. exp. Hypn.*, 1962, 10(2), 101-108.—A cross-validation of reported high successes of hypnotic induction and statements that success was independent of the operator when using Pascal's technique showed that: (a) an experienced-operator group clearly excelled a training group, and (b) the experienced group almost exactly replicated percentage-wise the successes claimed by Pascal and Salzberg.—*C. S. Moss.*
5225. Goldman, Bert A. (Mary Washington Coll.) Hypnosis: Its present legal status in the United States. *Amer. Psychologist*, 1962, 17(10), 715-717.—The "purpose of this paper is to provide a synopsis of the legal position of hypnosis as it stands today within each of the 50 United States and the District of Columbia." 44% of the states currently have at least one law specifically regulating some kind of involvement with hypnosis. A table is presented specifying 7 types of statutes pertaining to hypnosis and indicating which type has been passed by a particular state.—*S. J. Lachman.*
5226. Heron, W. T. (U. Minnesota) A confusion of verbs: To use and to need. *Amer. J. clin. Hypn.*, 1962, 4(4), 211-214.—What goes under the heading of psychodynamics has been greatly overplayed. This overemphasis has been the result of a slavish following of Freud—sometimes with a very poor understanding of what Freud said. Hypnosis may be very useful as an adjunct in changing behavior.—*M. V. Kline.*
5227. Hilgard, Josephine R., & Hilgard, Ernest R. (Stanford U.) Developmental-interactive aspects of hypnosis: Some illustrative cases. *Genet. Psychol. Monogr.*, 1962, 66(1), 143-178.—9 cases are presented, selected from a sample of 220 university students tested for hypnotic susceptibility and interviewed following the experience with attempted hypnotic induction. Emphasis was placed in the interviews upon childhood experiences as developmental antecedents of hypnotic susceptibility. The theory being explored is that these developmental factors lead to a readiness to experience hypnosis when the interaction with the hypnotist occurs. A representative cluster of highly hypnotizable and less hypnotizable Ss is illustrated by 4 cases, a high and a low female subject and a high and a low male S. 2 cases show selective responsiveness within hypnosis, one passing motor items but failing amnesia, the other being weak on motor items but passing amnesia. Childhood background appears to be related to this

selective responsiveness. The 3 final cases show that Ss with some pathological trends may also be highly susceptible. It is indicated that hypnosis is an unusually fertile area in which to test psychoanalytic propositions with a normal population, propositions such as those bearing on ego structure and function, on transference, and on regression.—*Author abstract.*

5228. Klemperer, Edith. (315 E. 77th St., New York) **Projective phenomena in hypnoanalysis.** *Int. J. clin. exp. Hypn.*, 1962, 10(3), 127-133.—During hypnoanalysis patients who have been age-regressed may perceive themselves as experiencing childhood experiences and also as simultaneously watching these experiences from a distance. This 2nd projected personality may be in the guise of an adult, adolescent, child, or even an incorporeal being. In some patients it may occur with regularity, in others not at all. Representative case histories and possible dynamic mechanisms are discussed.—C. S. Moss.

5229. Kuhner, Arthur. **Hypnosis without hypnosis.** *Int. J. clin. exp. Hypn.*, 1962, 10(2), 93-99.—The traditional concept of hypnosis that seeks a "sleep" state through employment of formal induction techniques seriously limits its general clinical applicability. It fails to fit the special needs of the patient. An approach designed to counteract this shortcoming manipulates the interpersonal relationship factor. Case illustrations from dental practice support the viewpoint that the proper relationship is akin to the hypnotic one and comparable results obtain without resort to ritualistic induction methods.—C. S. Moss.

5230. Le Baron, George I. (USAF Hosp., Seattle, Wash.) **Ideomotor signalling in brief psychotherapy.** *Amer. J. clin. Hypn.*, 1962, 5(2), 81-91.—This paper reports a hypnotic technique applicable within the framework of brief psychotherapy, based on psychodynamics and utilizing a limited dissociation to focus ego operations on unconscious processes.—M. V. Kline.

5231. Lerner, M. (Araoz 2689, Buenos Aires, Argentina) **Comparative aspects of human and animal hypnosis.** *Amer. J. clin. Hypn.*, 1962, 5(1), 57-60.—A descriptive analysis of the comparative aspects of human and "animal" hypnosis.—M. V. Kline.

5232. Levitsky, Abraham. (St. Louis State Hosp., Mo.) **Guilt, self-criticism and hypnotic induction.** *Amer. J. clin. Hypn.*, 1962, 5(2), 127-130.—The dynamics of guilt and self-criticism as ego mechanisms are related to hypnotic induction and behavior.—M. V. Kline.

5233. Levitt, Eugene E., Lubin, Bernard, & Brady, John Paul. (Indiana U. Medical Cent.) **On the use of TAT Card 12M as an indicator of attitude toward hypnosis.** *Int. J. clin. exp. Hypn.*, 1962, 10(3), 145-150.—This investigation indicates that responses to TAT Card 12M do not predict attitude toward hypnosis in female Ss, though such predictiveness has been reported for male respondents. The basis for this differential predictiveness may be that the latter give a significantly greater proportion of themes involving hypnosis. An explanatory hypothesis, based on perceptual theory and the stimulus properties of the card, is advanced.—C. S. Moss.

5234. Mellenbruch, P. L. (U. Kentucky) **The validity of a personality inventory tested by hypnosis.** *Amer. J. clin. Hypn.*, 1962, 5(2), 111-114.—Hypnosis can be used as a basis for evaluating the validity of a personality inventory and clarifying the dynamics of test responses.—M. V. Kline.

5235. Pattie, F. A., & Griffith, R. (U. Kentucky, Lexington) **The non-hypnotizability of Korsakoff patients.** *Amer. J. clin. Hypn.*, 1962, 5(1), 61-62.—The failure to induce hypnosis in 6 or in any number of Korsakoff patients does not prove that no Korsakoff patient can be hypnotized. But it is highly unlikely that patients with such a severe impairment of memory for current happenings will ever be able to enter the hypnotic trance.—M. V. Kline.

5236. Pattie, F. A., & Watkins, J. R. (U. Kentucky, Lexington) **Hypnosis and contact lenses: Fear alleviation and facilitation of initial fitting.** *Amer. J. clin. Hypn.*, 1962, 5(1), 52-56.—The use of hypnosis in the fitting of contact lenses is described for a number of patients with fears in this connection.—M. V. Kline.

5237. Pulver, S. E. (111 N. 49th St., Philadelphia, Pa.) **Uncovering the traumatic event as a hypnotherapeutic technique.** *Amer. J. clin. Hypn.*, 1962, 5(1), 42-46.—An evaluation of the dynamics of hypnotic abreaction of traumatic events and its relationship to hypnotherapy.—M. V. Kline.

5238. Rosenhan, David, & London, Perry. (Educational Testing Service) **Hypnosis: Expectation, susceptibility, and performance.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 77-81.—78 male undergraduates performed on a hand dynamometer, a weight endurance task, and a tremor task, prior to knowing that the experiment dealt with hypnosis. They were subsequently asked to volunteer for a hypnosis experiment. Of the 68 volunteers 16 were classified as susceptible to hypnosis and 16 relatively unsusceptible on the basis of their performance on the Group Hypnotic Susceptibility Scale. During the next session, all were administered the physical performance tests in the un hypnotized and hypnotized states. The results for the dynamometer and endurance tasks suggested that, if anything, differences between susceptible Ss were more marked before they knew that the experiment dealt with hypnosis, becoming less evident during the postknowledge conditions. For the tremor test, only slight differences emerged between the susceptible and unsusceptible groups on the preknowledge condition, but these grew increasingly larger during the postknowledge conditions, favoring the susceptible group. Indeed, hypnosis seemed to markedly improve the performance of susceptible Ss, while having little effect on unsusceptible ones.—*Journal abstract.*

5239. Schneider, Norman. (Los Angeles, Calif.) **Hypnotism and you: An essay on the theory and practice of the hypnotic art.** New York: Exposition, 1962. 77 p. \$2.50.—A brief theoretical and speculative essay on the nature of hypnosis and its relationship to certain other subjective experiences particularly those emanating from psychopharmacological action. Written by a layman, this book is apparently intended for the general public.—M. V. Kline.

5240. Shor, Ronald E. (Harvard U.) **Physiological effects of painful stimulation during hyp-**

notic analgesia under conditions designed to minimize anxiety. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 183-202.—A test of the physiological effects of painful stimulation during hypnotic analgesia was conducted under conditions designed to minimize anxiety. No significant differences were obtained between the experimental conditions. The interpretation was advanced that, inasmuch as the subjective experience of pain is eliminated during hypnotic analgesia, those physiological reactions do not occur which would otherwise ordinarily result from the stressful or threatening qualities of the painful stimulation. It was further advanced that anything else which minimizes the incidental anxiety component of the total pain experience can have an effect similar to that of hypnotic analgesia.—C. S. Moss.

5241. Spankus, Willard H., & Freeman, Linda G. Hypnosis in cerebral palsy. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 135-139.—Hypnosis was used with 19 cerebral palsy patients to determine its value in the treatment of this condition. 4 patients demonstrated definite benefit; however, in general, the results were not remarkable. Interpersonal relationships developed during therapy were probably as important in the improvement of the patient as was the hypnotic state itself.—C. S. Moss.

5242. Strosberg, I. M., & Vics, I. I. (262 S. Main Ave., Albany, N. Y.) Physiologic changes in the eye during hypnosis. *Amer. J. clin. Hypn.*, 1962, 4(4), 264-267.—The reduction of the blood supply in the vascular anastomosis, the greater reluctance of the arcades, the change in the curvature of the cornea, and the engorging of the vessels on the sclera all indicate that physiologic changes take place in the eye during hypnosis. These changes may quite possibly have counterparts in subepithelial areas elsewhere in the body.—M. V. Kline.

5243. Valett, Robert E. (U. Canterbury, New Zealand) Psychological training in hypnosis in New Zealand. *Int. J. clin. exp. Hypn.*, 1962, 10(2), 119-121.—Brief description of a recently developed university training course in hypnosis.—C. S. Moss.

5244. Webb, Robert A. (Alabama State Hosp.) The postural sway measurement of suggestibility: A methodological and reliability study. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 155-161.—2 disadvantages of the postural sway suggestibility measure are ordinal scaling and nonnormal distribution of scores. Advanced as a partial solution to these problems was the method of measuring the degree of opposite responses while considering zero as just another scale value. This method produces normally distributed data drawn from an interval scale; the test-retest reliability coefficient was .76.—C. S. Moss.

5245. Webster, Raymond B. (Martin Marietta Corp.) The effects of hypnosis on performance on the H-T-P and MPS. *Int. J. clin. exp. Hypn.*, 1962, 10(3), 151-153.—Impressionistic analysis supported the view that hypnosis Ss provide richer protocols in the House-Tree-Person projective technique than in the waking state. A quantitative analysis of subtest and total scores on the Minnesota Personality Scale in the 2 states was insignificant.—C. S. Moss.

5246. Weitzenhoffer, Andre M. (Stanford U.) Estimation of hypnotic susceptibility in a group situation. *Amer. J. clin. Hypn.*, 1962, 5(2), 115-126.—A method is described for evaluating group

hypnotic susceptibility on a standardized basis.—M. V. Kline.

5247. Wiseman, Richard J., & Reyher, Joseph. (Michigan State U.) A procedure utilizing dreams for deepening the hypnotic trance. *Amer. J. clin. Hypn.*, 1962, 5(2), 105-110.—A technique is reported which utilizes the sleep-dream cycle to facilitate a deepening of the hypnotic trance.—M. V. Kline.

5248. Woolington, J. M., & Markwell, Earl D., Jr. (U. Tulsa) The influence of hypnosis on self-attitudes. *Int. J. clin. exp. Hypn.*, 1962, 10(2), 109-113.—A study of the self-attitudes of Ss, measured on the Gough Adjective Check List, as they were affected by hypnosis. No significant alterations occurred as a result of hypnosis, regardless of depth.—C. S. Moss.

5249. Yanovski, Alexander G. (5501 Greene St., Philadelphia, Pa.) The feasibility of alteration of cardiovascular manifestations in hypnosis. *Amer. J. clin. Hypn.*, 1962, 5(1), 8-16.—An approach, using hypnosis, for inhibiting cardiovascular responses to psychic stimuli or interrupting cardiovascular disturbances of psychosomatic origin was described. Methodological considerations with respect to choice of Ss, criteria of effectiveness, and other aspects of experimental design were presented as were the hypnotic techniques employed.—M. V. Kline.

DREAMS

5250. Berger, R. J., Olley, P., & Oswald, I. (U. Edinburgh, England) The EEG, eye-movements and dreams of the blind. *Quart. J. exp. Psychol.*, 1962, 14(3), 183-186.—It was found that characteristic frontal EEG waves significantly often precede the rapid eye movements of dreaming. The rapid eye movements were absent during dream periods of 3 men with life-long blindness, and of 2 men, 30 and 40 years blind, respectively, but were present during dream periods in 3 men blind only 3, 10, and 15 years, respectively.—*Journal abstract.*

5251. Fromm, E. (U. Chicago) Let's keep our concepts straight. *Percept. mot. Skills*, 1962, 15(1), 217-218.—In criticism of an article by Roth, this author contends that visual imagery in dreams is a subjective phenomenon, not an objective stimulus perceived correctly or incorrectly. It cannot be used as evidence of faulty sensory perception, nor as the basis for drawing conclusions about the relation of perception and motility.—W. H. Guertin.

5252. Jones, R. M. (Brandeis U.) On the metaphor of the dream censor. *Percept. mot. Skills*, 1962, 15(1), 45-46.—Dreams are discussed in relation to perception and Freud's "censor." New concepts and approaches to dream analysis are urged.—W. H. Guertin.

5253. Kahn, Edwin; Dement, William; Fisher, Charles, & Barmack, Joseph E. (City Coll. New York) Incidence of color in immediately recalled dreams. *Science*, 1962, 137(Whole No. 3535), 1054-1055.—With careful interrogation close to the time of dreaming, color was found to be present in 82.7% of the dreams. This figure is substantially higher than figures reported by previous investigators using questionnaire and other methods.—*Journal abstract.*

5254. Roth, N. More on the metaphor of the dream censor. *Percept. mot. Skills*, 1962, 15(1),

82.—A reply to comments by Jones (see 37: 5252) on an earlier paper (see 37: 3394) discusses further dreams as perceptions and the place of Freud's "censor."—*W. H. Guertin*.

5255. Rubiner, William. Concerning dream life. *Amer. Imago*, 1961, 18(4), 318-329.—This translation from the original German of an article published in 1882 shows something of the intellectual atmosphere in which Freud worked. In many respects, the author appears to anticipate Freud but concludes "Dreams are really shadows, empty, meaningless, small air bubbles, imagination, images without content or value, to which only superstitious and dull brains attach serious significance."—*W. A. Varvel*.

5256. Ward, Clyde H. Some further thoughts on the examination dream. *Psychiatry*, 1961, 24(4), 324-336.—After a brief review of literature, and a formulation of the language of misbehaving in terms of guilt, 8 examples of examination dreams are presented.—*C. T. Morgan*.

CASE HISTORIES

5257. Aboulker, P., & Chertok, L. (Hopital Cochin, Paris, France) Emotional factors in stress incontinence. *Psychosom. Med.*, 1962, 24(5), 507-510.—After pointing out that there is not a single reference to this problem in the literature, the authors describe a case where surgery did not help and the history indicated a very unhappy childhood. Supportive psychotherapy and hypnosis removed the symptom. The patient has been functioning adequately now for 3 years.—*W. G. Shipman*.

5258. Bhaskaran, K. Borderline schizophrenia. *Pratibha*, 1959, 2(1), 8-13.—A case of borderline schizophrenia is described, with results of psychiatric examination and modified MMPI.—*U. Pareek*.

5259. Brody, Morris W. The psychiatric case conference. *Psychiatry*, 1961, 24(4), 361-366.—"The clinical case conference is one of the most important methods for the teaching and learning of psychiatry. It is a form of study in which, at one time or another, each participant serves as preceptor or student." Some prescriptions for the handling of the case conference are given.—*C. T. Morgan*.

5260. Kaplan, S. M., & Hetrick, E. S. (Cincinnati General Hosp.) Thyrotoxicosis, traumatic neurosis, and the dangerous environment. *Psychosom. Med.*, 1962, 24(3), 240-248.—A case is reported of a 28 year old man who experienced both thyrotoxicosis and traumatic neurosis soon after he had been in a bus accident. The difficulties in differentiating between some of his symptoms of these 2 disorders suggested a relationship between them. Several hypotheses are presented concerning the psychophysiological mechanisms of normal and abnormal thyroid function.—*W. G. Shipman*.

5261. Parsons, Anne. A schizophrenic episode in a Neapolitan slum. *Psychiatry*, 1961, 24(2), 109-121.—A "case history of a young psychotic woman hospitalized in Naples, Italy," viewed from the standpoint of an anthropologist.—*C. T. Morgan*.

5262. Sacerdoti. Étude pluridimensionnelle d'un adolescent sacrilège: Actions apparemment obsessionnelles, structure paranoïaque. [A pluridimensional study of an adolescent sacrilege: Apparently obsessive actions, paranoid structure.] *Encephale*,

1962, 51(2), 198-201.—Case presentation of a 16-year-old boy who committed repeated sacrilegious acts of nocturnal profanation of churches, ciboria, and consecrated hosts. The diagnostic problem is discussed.—*W. W. Meissner*.

5263. Schrandt, Carmen. Angsthysterie bei einem zehnjährigen Mädchen. [Anxiety hysteria in a 10-year-old girl.] *Psyche, Stuttgart*, 1962, 16(2), 100-110.—Psychoanalysis of a 10-year-old girl with intense father identification and penis introject. The latter was experienced anal-sadistically until a male exhibitionist disturbed the structure, giving rise to an attack of death anxiety. In defense against object loss she displaced the introject outwards in the image of a bad wolf, at the same time seeking to protect herself against the loss of the maternal object by constantly having a female companion.—*E. W. Eng*.

5264. Slavson, S. R. (Children's Village, Dobbs Ferry, N. Y.) Patterns of acting out of a transference neurosis by an adolescent boy. *Int. J. group Psychother.*, 1962, 12(2), 211-224.—A case history of a 14½-year-old boy.—*L. N. Solomon*.

PSYCHIATRIC SERVICES

5265. Szasz, Thomas S. (State U. New York, Upstate Medical Cent., Syracuse) Mind tapping: Psychiatric subversion of constitutional rights. *Amer. J. Psychiat.*, 1962, 119(4), 323-327.—The argument is developed that "the recent practice of pretrial psychiatric examination of defendants, on the order of the court and against the wishes of the accused, promises to effectively nullify some of our most important constitutional rights—namely, the right to a speedy trial and the right, in the words of Louis D. Brandeis, 'to be let alone.'"—*N. H. Pronko*.

5266. Whittington, H. G. Evaluation of the treatment program in a college psychiatric clinic. *Comprehen. Psychiat.*, 1961, 2(6), 329-337.—Using 158 Ss, there was 54% improvement for males and 67% improvement for females. For more than ½ the students seen, psychotherapy was necessary after completion of their collegiate education. It is by no means true that emotional problems in college are transitory upsets in essentially normal people. The initial experience of psychotherapy in college is the first step in coping with longstanding neurotic problems.—*D. Prager*.

5267. Wijsenbeck, Henricus. (Geha Psychiatric Hosp. Petah Tikva) Psychiatric and social work in a rehabilitation hospital. *Dap. refuim*, 1961 (Suppl.), 150-159.—"The new approach in psychiatry is existentialist, social, and anthropological based on the premise—now universally accepted—that man is inseparable from the world surrounding him." The work of an experimental rehabilitation center, founded in 1957 by the Sick Fund in Israel and intended for chronic psychiatric patients, is described. The main idea is to establish an open door hostel, run by its inhabitants and without its own medical staff, which could serve as a bridge between hospital and normal life. It must lead gradually to normal life and work outside. Psychotherapy is based on group therapy and rehabilitation treatment. 20 out of 28 discharged patients returned to normal life. (French summary)—*H. Ormian*.

Institutional Care

5268. Gilliland, Gwyneth Witney, & Sommer, Robert. A sociometric study of admission wards in a mental hospital. *Psychiatry*, 1961, 24(4), 367-376.—"While depressives tend to choose other depressives as friends . . . they also form a substantial number of relationships with paranoid patients. Schizophrenics appear to be attracted to alcoholics, although they also choose friends among other schizophrenics and paranoids. Paranoids prefer to choose among the alcoholics and depressives in establishing relationships." Alcoholics tend to choose alcoholics, and choose other types of friends only when alcoholics are not present.—C. T. Morgan.

5269. Hagen, Elizabeth, & Wolff, Luverne. Nursing leadership behavior in general hospitals. New York: Teachers College Columbia Univ., Institute of Research and Service in Nursing Education, 1961, viii, 198 p.—Report of a study which investigated: (a) What specific behaviors by nursing administrators, supervisors, and head nurses are perceived as effective or ineffective in achieving the goals of respective nursing service administrations? (b) To what extent are factors of size of the hospital, urban-ruralness of the hospital, experience and education of the person holding the leadership position, and the organizational pattern within the hospital related to the perception of effective and ineffective leadership behavior? (c) What kinds of leadership are associated with a favorable psychological climate among staff nurses? Data were collected in 9 large and 6 small private hospitals in Connecticut, Maryland, New Jersey, New York, and Pennsylvania. Implications for staff nurses, supervisors, administrators, and future research are discussed.—C. W. Page.

5270. Kitchener, Howard; Sweet, Blanche, & Citrin, Eve. Problems in the treatment of impulse disorder in children in a residential setting. *Psychiatry*, 1961, 24(4), 347-356.—"The ideas presented in this paper are based on the findings from an experiment in the treatment of aggressive acting-out boys. There were six children in the study, which was of 5 years' duration. . . [Very] intensive treatment efforts were possible in the milieu and in psychotherapy. . . Explicitly, this paper is concerned with the technical issues entering into the management of aggressive behavior and the choice of interpretation."—C. T. Morgan.

5271. Lehrman, N. S. Follow-up of brief and prolonged psychiatric hospitalization. *Comprehen. Psychiat.*, 1961, 2(4), 227-240.—Data presented from 3 hospitals in different states seem to indicate that prolonged hospitalization in itself may be harmful to psychiatric patients and the longer they are exposed to the hospital the more adversely they sometimes seem to be affected. All 3 groups seemed to show poorer results than Bleuler obtained 65 years ago. The presence of inpatient psychotherapy had, if anything, a negative effect on outcome. It might be in order to consider ending longterm psychotherapeutic hospitalization as well as attempting to shorten psychiatric hospitalization in general. It is emphasized that this study is not exhaustive.—D. Prager.

5272. Pfautz, Harold W., & Wilder Gita Z. (Brown U.) The ecology of a mental hospital.

J. Hlth. hum. Behav., 1962, 3(2), 67-72.—An ecological study of personnel in a small private hospital revealed relationships between physical and psychological distance. An "Index of Dissimilarity" provided an objective measure which revealed a host of social psychological implications: For example, communication and function had to bridge status barriers. Patients seemed to be drawn from preferred neighborhoods. There was a numerical predominance of the patron group. In addition, the index of dissimilarity was greatest between the professional staff and the day patients, whereas the nonprofessional staff were much "closer" to the patients. It was concluded that the social isolation of a mental hospital can be as unfortunate as its traditional geographical isolation.—L. A. Ostlund.

5273. Scheff, T. J. (U. Wisconsin) Differential displacement of treatment goals in a mental hospital. *Admin. Sci. Quart.*, 1962, 7(2), 208-217.—The displacement of treatment goals in a mental hospital is described as it varies with different wards and different shifts. The degree of displacement is related to characteristics of the wards and shifts. Hypotheses are developed about the determinants of goal displacement in social groups. 3 determinants are discussed: characteristics of the goals themselves, amount of regulation of staff behavior by outside groups, and the availability of role imagery to structure staff-inmate contacts.—V. S. Sexton.

5274. Sivadon, P. (Hôpital Brugmann, Brussels) Le problème de l'espace à l'hôpital psychiatrique. [The problem of space in psychiatric hospitals.] *Acta neurol. psychiat. Belg.*, 1962, 62, 243-239.—Studies have shown the essential part played by space in the structuration of personality. The author emphasizes the effect of space on mental patients which might be responsible for agitations, phobias, and even regressing tendencies. He draws practical conclusions from these findings as to the space arrangements in mental hospitals.—V. Sanua.

5275. Stanton, Alfred H. Milieu therapy and the development of insight. *Psychiatry*, 1961, 24 (2, Suppl.), 19-29.—A discussion of the problems of creating and managing a therapeutic hospital environment.—C. T. Morgan.

5276. Surber, Grace P. (New Hampshire State Hosp., Concord) The exit interview. *Ment. Hosp.*, 1962, 13(9), 466-467.—41 consecutive discharges from a state mental hospital were seen by a psychologist for a semistructured 10-item interview. Help gained from attendants and other patients and from transfer to open wards figured prominently in the responses.—L. Gurel.

5277. Szasz, Thomas S. (State U. New York, Syracuse) Open doors or civil rights for mental patients. *J. indiv. Psychol.*, 1962, 18(2), 168-171.—Unlocking doors is insufficient. We must no longer avoid facing some of the larger issues, e.g., care of the mentally ill is not primarily a medical affair, civil commitment should be abolished, therapeutic and custodial functions must be separated. The hospitalized mental patient is society's scapegoat against whom discrimination is practiced as well as upheld by law.—A. R. Howard.

5278. Tanaka, Henry. Group living on a psychiatric ward. *Soc. Wk.*, 1962, 7(4), 51-58.—A

test of the theory that much of the psychiatric patient's illness is traceable to insufficient motivation for the individual to fulfill the demands of roles given to him by society. Hospitalized mental patients were organized into formal groups that conducted meetings, held orientation sessions, arranged improvement and recreation committees, etc. This organized the patients into active societies which motivated them to improve. Results were good.—G. Elias.

Community Services

5279. Crockett, Richard W. (Ingrebourne Centre, St. George's Hosp., Hornchurch, Essex, England) Initiation of the therapeutic community approach to treatment in a neurosis center. *Int. J. group Psychother.*, 1962, 12(2), 180-193.—A descriptive account of the introduction of the therapeutic community approach in a neurosis center is presented. Procedure included a change of the authority structure from a vertical to a horizontal one and the facilitation of maximum intercommunication through group discussion and the delegation of authority.—L. N. Solomon.

5280. Hoenig, J., & Srinivasan, Uma. Aspects of the mental health service: Past and present. *Pratibha*, 1959, 2(2), 13-25.—Analysis of the admission figures for 1953 of the mental hospital in Bangalore shows that admission rates and length of stay depend on such factors as distance of residence from the hospital and type of residence. It is better to have mobile peripheral psychiatric units.—U. Pareek.

5281. Mandelbrote, B., & Folkard, S. Some problems and needs of schizophrenics in relation to a developing psychiatric community service. *Comprehen. Psychiat.*, 1961, 2(6), 317-328.—In a follow-up study of 171 schizophrenics living in the community, 96 appeared to be well and only 3 seemed severely ill. 146 were fully welcomed by their families. 24 of 60 male patients were unemployed. 46 had financial problems. The patients seemed to be more aware of their personal and social problems than of problems related to their work and families. The help most sought was for medical and psychiatric outpatient assistance in obtaining work and for social clubs. Schizophrenics require long term support if they are to manage adequately in the community.—D. Prager.

5282. Rao, P. Madhu; Lalitamba, A. S., Dash, S., & Surya, N. C. The Child Guidance Clinic at All-India Institute of Mental Health. *Pratibha*, 1959, 2(2), 65-70.—An account of the workings of the clinic and an analysis of the population attending the clinic are given.—U. Pareek.

Case Work

5283. Shentoub, Vica. Fonction du test projectif dans un travail d'équipe. [Function of the projective test in clinical teamwork.] *Psychol. Franc.*, 1962, 7(2), 126-133.—A discussion and an illustrative case are presented showing the effects of cooperative work by a team representing psychiatry, psychology, and psychotherapy. Emphasis is on the need for mutual understanding in classification and terminology. Results with the TAT are compared with findings after extensive psychotherapy.—C. J. Adkins.

COUNSELING & GUIDANCE

5284. Anderson, R. P., & Anderson, G. V. (Texas Technological Coll.) Development of an instrument for measuring rapport. *Personnel Guid. J.*, 1962, 41(1), 18-24.—The Interview Rating Scale is described as a means of providing an operational definition of ideal rapport or effective communication in counseling interviews. Research has supported the effectiveness of the scale as a measure of rapport.—S. Kavruck.

5285. Chenault, JoAnn, & Seegars, James E., Jr. The interpersonal diagnosis of principals and counselors. *Personnel Guid. J.*, 1962, 41(2), 118-122.—Too little emphasis has been placed on personal factors in conflicts arising among administrative and guidance personnel. Measures of the interpersonal relationships of specific subgroups within guidance programs with identification of personality variables which could influence interpersonal problems in this area, appeared useful. Counselors and principals were found to be essentially dominant persons. Principals leaned toward the competitive side of the continuum and counselors toward the tolerant side. Principals preferred counselors to be firmer and more aggressive, even though this is seen as conflicting with the counseling ideal.—S. Kavruck.

5286. Cohn, Benjamin, & Sniffen, A. Mead. A school report on group counseling. *Personnel Guid. J.*, 1962, 41(2), 133-138.—A project concerned with underachieving 7th-grade boys who demonstrated acting-out behavior, supports the following recommendations: Teachers' attitudes with respect to these pupils should lean more toward a sincere concern for their welfare. Teachers should offer and even create as many opportunities for these pupils as possible. A school administration should consider an ungraded approach for these pupils. Such pupils should be included in group projects outside of their "chosen" group relationships. The reading specialist should provide individual reading sessions which could lead to discussion of personal feelings and attitudes. The school should refrain from use of preconceived labels for such pupils.—S. Kavruck.

5287. Goodstein, Leonard D. (U. Iowa) Problems in counseling older disabled persons. *J. Rehabil.*, 1962, 28(4), 24-25.—The counseling of the older client may be somewhat more complicated than with younger individuals. It can be made effective, however, if there is an adequate understanding of the problems of the aging and the transference-countertransference factors which play a highly significant role in determining the attitudes of counselor and client.—M. A. Seidenfeld.

5288. Grossman, Alvin. (California State Dept. Education, Sacramento) A new approach to guidance research using an electronic computer. *Calif. J. educ. Res.*, 1962, 13(4), 170-173.—Recommended, in a general way, is the use of operations research techniques in the development of optimum methods for decision making ("problems of grand strategy") and of optimum methods for sustaining a program or operation of a program ("such as assignments of special staff, registration activities, and optimal counseling loads").—T. E. Newland.

5289. Heilbrun, A. B., Jr., & Sullivan, D. J. The prediction of counseling readiness. *Personnel Guid. J.*, 1962, 41(2), 112-117.—The study attempted

to develop empirical scales to predict the readiness of college students for personal adjustment counseling. Adjectives, differentially endorsed by clients who terminated prematurely and those who stayed in personal counseling, were included in a male and female form of the Counseling Readiness Scale (CRS). College norms were developed. The male CRS was shown to distinguish between male vocational-educational counseling clients who failed to appear for interview and those who had more than the usual number of interviews. The female CRS showed no significant difference in predicting directions.—S. Kavruck.

5290. Klink, Thomas W. (Menninger, Found.) **Some categories of religious data significant for the clinician.** *J. pastoral Care*, 1962, 16(2), 72-80.—A summary of recent empirical studies under the headings: (a) Religion as an Aspect of the Social/Cultural Matrix for Personality; (b) Religion as an Expression of the Self-Concept; and (c) Religion as Source for Secondary Process Forms, for Socialized Expression of Primary Process, Repressed Material Plus Attendant Emotional Energy.—O. Strunk, Jr.

5291. Kulshreshtha, S. K. **They also look to us for guidance.** *Shiksha*, 1962, 14(3), 103-116.—A case of counseling an adolescent boy having emotional difficulties is described in detail from the beginning to the successful termination of counseling.—U. Pareek.

5292. Rottschaefer, R. H., & Renzaglia, G. A. (Southern Illinois U.) **The relationship of dependent-like verbal behaviors to counselor style and induced set.** *J. consult. Psychol.*, 1962, 26(2), 172-177.—College students evaluated for frequency of dependent statements made in a 1st interview. Reflective counselors obtain fewer dependent statements than leading counselors. Ss given a set to expect a leading counselor also make more dependent statements. There was no interaction between set and counselor type.—E. R. Oetting.

5293. Seidenfeld, Morton A. (Office Vocational Rehabilitation, Washington, D. C.) **The need-oriented profession of rehabilitation counseling: Implications for selection, training and services.** *J. Rehabil.*, 1962, 28(4), 11-13.—A discussion of some of the fundamental needs in the selection, training, and utilization of the rehabilitation of the physically and mentally disabled.—M. A. Seidenfeld.

5294. Shimberg, Benjamin, & Katz, Martin R. (Educational Testing Service, Princeton, N. J.) **Evaluation of a guidance text.** *Personnel Guid. J.*, 1962, 41(2), 126-132.—The evaluation study indicates that group guidance courses using Katz's *You: Today and Tomorrow* (1959) may result in pupils' increased self-understanding and greater awareness of factors to consider in educational and occupational planning. It is cautioned, however, that no basis exists for concluding that such courses substitute for individual counseling.—S. Kavruck.

MARRIAGE & FAMILY PROBLEMS

5295. Arnold, Arthur. (U. North Carolina) **The implications of two-person and three-person relationships for family psychotherapy.** *J. Hlth. hum. Behav.*, 1962, 3(2), 94-97.—It is pointed out that in practice, psychotherapists seldom work directly with

the family as the treatment unit in psychotherapy. This is attributed to the sociological formulation that "relatedness is essentially dyadic, and that triadic turmoil, a shifting reactive pattern of dyadic alliances, is intrinsic to a threesome. Such phenomena touch upon the relatedness needs of therapist as well as patient, and require specific understanding for their utilization in a therapeutic regimen."—L. A. Ostlund.

5296. Biermann, Gerd. **Die Familien-Neurose in ihrer Projektion im Familien-Zeichen-Test.** [Family neurosis as projected in the Family Drawing Test.] *Psyche, Stuttgart*, 1962, 16(2), 127-141.—A common form of family neurosis today centers around the inadequate father whose defenses reflect the character of his own neurotic development. 4 cases of disturbed children from such neurotic families are viewed in the context of their drawings made to the following instructions: (a) "draw a family"; (b) "imagine your family as an animal family and draw them that way"; (c) "a magician comes and puts your family under a spell. You can draw them any way you want to."—E. W. Eng.

5297. Bricklin, B., & Gottlieb, S. G. **The prediction of some aspects of marital compatibility by means of the Rorschach test.** *Psychiat. Quart. Suppl.*, 1961, 35(2), 281-303.—8 couples were studied in 16 sessions of group psychotherapy. 3 facets of the Rorschach movement response were used to compute a Marital Compatibility Prognostic Score. The smaller the difference in numbers of M responses between a husband and wife, the fewer the nonconcordances in M qualities; and the fewer the Sex Confused and Distorted M, the greater the probability that compatibility will improve as communication between husband and wife increases. However, not all married couples benefit from increased communication. Further experimental work is called for in this area.—D. Prager.

5298. Jackson, Don D., & Weakland, John H. **Conjoint family therapy: Some considerations on theory, technique, and results.** *Psychiatry*, 1961, 24(2, Suppl.), 30-45.—A discussion of the theory and of the results of conjoint family therapy with 18 families.—C. T. Morgan.

5299. Mitchell, Howard E., Bullard, James W., & Mudd, Emily H. (U. Pennsylvania) **Areas of marital conflict in successfully and unsuccessfully functioning families.** *J. Hlth. hum. Behav.*, 1962, 3(2), 88-93.—Data from 200 cases of marriages in conflict and 100 successful marriages were used. Though many observations and much data were gathered on the latter group, the findings were based solely upon the Marriage Adjustment Schedule 1-A. "It was found that both groups rank their problem areas in the same order: the economic problems rank highest and religious and educational problems lowest. The data also indicated that husbands and wives in each group, although they had been questioned quite separately, agreed in general about the problem areas and their order of frequency." Moreover, it was found that even happily married couples admit to problems. Cultural implications include: the materialistic pressures on family living; the transitional role of husband and wife in the American home; and the attitudes, values, and goals currently prevalent for young people seeking mates and for couples already married in the United States.—L. A. Ostlund.

5300. Smith, L. J. Home dynamics study: A search for dimensions of the family climate. *Charact. Potential*, 1962, 1(1), 45-48.—A questionnaire containing items related to 63 personality and situational variables was administered to over 400 parents. The parents independently rated the perceived influence of the 63 factors on themselves and their mate as they were in the process of teaching one child a character attitude. Each of these factors was correlated with every other factor and these correlations subjected to cluster analysis. Several dynamics were discovered which are believed to be operating in favorable and unfavorable family climates for effective character education of children. A dynamic is defined as the interaction of 2 or more personality or situational variables which exert a force in the behavioral field. Action studies validated the findings and revealed that families who worked on one specific factor in a dynamic were more successful than those who worked on the whole dynamic.—*W. T. Penrod*.

MENTAL HEALTH & REHABILITATION

5301. Beley, A., & Faure, H. Enquête nationale d'hygiène mentale portant sur le devenir des modes d'assistance en neuropsychiatrie infanto-juvenile. [A national health investigation dealing with the methods of help in child and adolescent psychiatry.] *Hyg. ment.*, 1962, 51(3), 129-139.—The results of a questionnaire survey of French pediatricians and child psychiatrists sponsored by the French League of Mental Health are presented. The peculiar nature of childhood and adolescent problems and special needs for dealing with them are stressed. The practical problems in this area need better conception and formulation.—*W. W. Meissner*.

5302. Bonner, Hubert. (Ohio Wesleyan U.) Idealization and mental health. *J. indiv. Psychol.*, 1962, 18(2), 136-146.—"The psychologically healthy person . . . perceives himself as an active, self-affirming being who . . . has faith in achieving his ends,, if only by successive approximations. . . . shows the courage to envisage and to anticipate a challenging, and perchance a disappointing future."—*A. R. Howard*.

5303. Dunn, Halbert L. High level wellness. Arlington, Va.: R. W. Beaty, 1961. 244 p. \$4.50 (cloth); \$1.95 (paper).—29 short talks on various aspects of well-being, originally prepared for use on the radio.—*C. T. Morgan*.

5304. Ellis, Helen H. (U. New Mexico) The patient on leave: A qualified success story. *Ment. Hosp.*, 1962, 13(9), 491-493.—A 20% sample (N = 112) of patients on convalescent leave from New Mexico State Hospital was followed up in the community. The data "paints a grim picture . . . [and] point up the fact that the status of the convalescent mental patient is considerably less happy than we would like to think."—*L. Gurel*.

5305. Nikelly, Arthur G. (U. Illinois) Social interest: A paradigm for mental health education. *J. indiv. Psychol.*, 1962, 18(2), 147-150.—Education for mental health has failed mainly as a result of its emphasis upon psychoanalytic principles. It will succeed when it is aligned with the more meaningful concept of "social interest."—*A. R. Howard*.

5306. Rosenthal, A. M. Five-year follow-up study of the patients admitted to the rehabilitation center of the hospital of the University of Pennsylvania. *Amer. J. phys. Med.*, 1962, 41, 198-211.—The dependency and employment status of those with frequently occurring disabilities, hemiplegia, amputation, paraplegia, rheumatoid arthritis, residual poliomyelitis, quadruplegia, and residual multiple sclerosis, were appraised on admission, on discharge, and on follow-up. With the exception of those with multiple sclerosis, a reasonably high percentage achieved independence but only sizeable fraction of amputees and polios hold jobs.—*H. J. P. Schubert*.

5307. Stafford-Clark, David; Mallett, Bernard L., & Willis, James H. P. Frontiers of research in mental health. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 37-61.—The contribution of modern psychiatric research to the restoration of the individual to reasonable happiness and well-being can be reviewed under the study of: (a) his basic constitution and personality, (b) his physical interaction with his environment, and (c) the mental stresses to which the pattern of his life submits him. Interest in the significance of abnormal patterns of electrical activity in the brain in relationship to patterns of adult behavior, and particularly those which seem to arise on a constitutional basis, has led to findings in which disordered behavior is in many instances directly correlated with abnormalities in the EEG record.—*J. DiGiovanni*.

5308. Ullman, Montague. Behavioral changes in patients following strokes. Springfield, Ill.: Charles C Thomas, 1962. viii, 103 p. \$5.25.—Psychiatry can be useful in understanding the impact and effect of a stroke upon the patient and in plotting subsequent treatment and rehabilitation plans. The text largely consists of the presentation of 64 cases that have suffered cerebrovascular accidents. The variability of reaction to stroke is dependent not solely upon the type, location, or extent of the damage but upon the premorbid personality and the current life situation. Patients can either integrate the stroke experience at a realistic level, submit in a passive manner, or may deny the fact and implication of the illness. (17-item bibliogr.)—*D. A. Santora*.

ABNORMAL PSYCHOLOGY

5309. Huxley, A. Visionary experience. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 11-25.—After discussing ways of gaining access to the visionary world, the article describes means of inducing access and the nature of visionary experience. Concluding sections deal with visionary experiences and religion and folklore and with visionary arts.—*B. T. Jensen*.

5310. Inhelder, B. (U. Geneva) A contribution of the genetic method to the study of various phenomena in the psychopathology of thinking. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 154-166.—Reference is made to current and published research to argue that the genesis of pathological thinking should be studied as well as comparing it with normal adult thinking.—*B. T. Jensen*.

5311. Lindemann, E. (Massachusetts General Hosp., Boston) Preventive intervention in situational crises. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 69-88.—Reaction to bereavement is discussed as are "grief work" and abnormal reactions. Several different kinds of instances of intervention are presented as the author urges interprofessional cooperation. (19 ref.)—B. T. Jensen.

5312. Østergaard, L. (Rigshospitalet, Copenhagen, Denmark) On "concreteness" in abnormal thinking. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 199-211.—". . . a frame of reference borrowed from developmental psychology may be more suitable to a differentiated description of regressive thinking than is the dichotomy of concrete-abstract." A 3-level model is proposed.—B. T. Jensen.

5313. Weil, A. P. Psychopathic personality and organic behavior disorders: Differential diagnostic and prognostic considerations. *Comprehens. Psychiat.*, 1961, 2(2), 83-95.—"This paper surveys early exogenous damage to personality development—the development of psychopathic personality and organic behavior disorders—in the light of differential diagnosis and prognostic considerations." Similar clinical pictures must be very carefully observed to make differential diagnoses. Organic damage may be superimposed upon a schizoid constitution or a psychopathic disorder. In prognosis the significant factor is the child's striving toward mastery and enjoyment of achievement, i.e., the capacity to neutralize.—D. Prager.

PHYSICAL HANDICAPS

5314. Jordan, Thomas E. (Tulane U.) Research on the handicapped child and the family. *Merrill-Palmer Quart.*, 1962, 8(4), 243-260.—Research on handicapped children has developed to current interest in the effects of disease in children on the family unit. Constructs such as crisis, attitudes, bereavement, independence, etc. have been used in conceptualizing recent work. (114 ref.)—E. L. Robinson.

5315. Seifert, Karl Heinz. (Im Schulzengarten 2, Neckargemünd) Kompensatorische Leistungsmöglichkeiten Mindersinniger im Bereich der Haptik. [Compensatory achievement potential of handicapped persons in the field of haptics.] *Z. exp. angew. Psychol.*, 1962, 9(1), 54-103.—The observation that sensorially handicapped persons excel in the haptic perceptual field was tested experimentally with blind, deaf-dumb, and normal children. Macromorphic discriminations (surface-texture, thickness, etc.) could be made with greater certainty by handicapped persons. Macromorphic discriminations (object recognition, form perception) were only better under special conditions. Blind persons showed superior distinction of familiar objects, but this advantage did not extend to unfamiliar ones. Deaf-dumb persons had difficulty in identifying unfamiliar objects because their objective world was limited by the language handicap. Teaching practices with handicapped persons based on the results of these experiments are discussed. (49 ref.)—W. J. Koppitz.

5316. Silverstein, A. B. (Pacific State Hosp.) Comment on Levi's "Orthopedic Disability as a Factor in Human-Figure Perception." *J. consult. Psychol.*, 1962, 26(1), 9-10.—"Levi's specific hypotheses . . . do not constitute a decisive test of her general hypothesis." Levi presents in rebuttal "a complete list of mean choices for all three experimental groups."—E. R. Oetting.

Blindness

5317. Cole, Malvin; Schutta, Henry S., & Warrington, Elizabeth K. (National Hosp., London, England) Visual disorientation in homonymous half-fields. *Neurology*, 1962, 12(4), 257-263.—3 cases were studied to obtain information on (a) "the relationship between the visual disorientation and the visual field defect" and (b) "the contribution to defective localization made by difficulties in using the upper limbs. . . . Two patients with unilateral visual disorientation associated with hemiambyopia were studied by means of light of variable intensities. It was found that the hemiambyopia was not the basis for the disorientation. A control patient with a bi-temporal field defect and no disorientation gave further evidence for this viewpoint. The disability appears to be one of vision and not one of reaching."—R. Gunter.

5318. Dinnerstein, A. J., & Wolfe, M. (New York Medical Coll.) Tactile slit scanning of letters. *Percept. mot. Skills*, 1962, 15(1), 135-138.—4 Ss were each given 20 practice sessions on a task requiring tactile recognition of letters. The letters could be explored only through a narrow slit (slit scanning). Speed and accuracy on this task proved as adequate as previously reported speed and accuracy in tactile discrimination of the whole letter. The results are relevant to the problem of designing reading machines for the blind.—W. H. Guertin.

Deafness

5336. Boskis, R. M. (Ed.) Izuchenie i obuchenie detei s nedostatkami slukha. [The study and teaching of children with hearing defects.] *Izv. Akad. Pedag. Nauk RSFSR*, 1961, No. 117, 134 p.—These transactions of the Institute of Defectology are devoted to reporting the results of research on the teaching and training of hard-of-hearing children. "Several principles of diagnosis of anomalous development" are discussed as are problems connected with the teaching of grammar, orthography, and speech formation. There is included a special report on pronunciation in deaf-mutes.—I. D. London.

5337. Dirks, Donald, & Carhart, Raymond. (Northwestern U.) A survey of reactions from users of binaural and monaural hearing aids. *J. speech hear. Discord.*, 1962, 27(4), 311-322.—206 users of binaural instruments, 211 monaural-aid users and 155 nonusers were studied by questionnaire. Normal hearers reported a substantially greater success in listening under each of 26 different environmental conditions. Both groups of hearing-aid users reported relatively poor performance in conditions with strong background noise. Users of binaural aids expressed strong beliefs in their superiority.—M. F. Palmer.

5338. Elliott, L. L., & Kraus, R. M. Followup of stapes mobilization patients. *USAF SAM tech.*

docum. Rep., 1962, No. 62-75. 6 p.—Questionnaires were sent to 93 patients who had undergone stapes mobilization operations. About 1 year after surgery 50% of the cases maintained at least a 25% improvement in hearing. Over 1/2 of the ears maintained a 25% improvement for 3 years or longer. Preoperation hearing level, amount of improvement immediately following surgery, and sex were unrelated to percent of hearing improvement. Patients over 40 years of age maintained proportionately greater improvement in hearing for at least 3 years. The operation tended to be more successful when surgery was required on only 1 ear than when it was required on both ears.—M. C. Payne, Jr.

5339. Farrimond, Thomas. (Liverpool, England) A test of the ability to lip-read—use visible cues of speech. *Amer. J. Psychol.*, 1962, 75(3), 477-481.—The present test was constructed for measuring "normal" adults. Test material includes a ciné-film of 2 parts: (a) lists of numbers spoken by a young woman with 6-second pauses, and (b) scenes of approximately 6 seconds with a woman speaking a short sentence after each. The product-moment correlation between the 2 parts of the test is +0.74.—R. D. Nance.

5340. Geist, Harold. (Gallaudet Coll.) Occupational interest profiles of the deaf. *Personnel Guid. J.*, 1962, 51(1), 50-55.—Results obtained with 931 employed male deaf using the Geist Picture Interest Inventory indicate that the interests of the deaf seem to be no different from those of the hearing in similar occupations.—S. Kavruk.

5341. Hinchcliffe, Ronald. (U. Iowa) The anatomical locus of presbycusis. *J. speech hear. Discord.*, 1962, 27(4), 301-310.—Review of the literature on presbycusis. An analysis of the known audiological measures that show changes with age indicates that the known histologic changes can account for the observed audiological changes. It seems likely that changes in the brain are primary for the over-all audiological picture of presbycusis.—M. F. Palmer.

5342. Jerger, J. Comparative evaluation of some auditory measures. *USAF SAM Rep.*, 1962, No. 62-26. 14 p.—A battery of auditory tests (air conduction audiogram, bone conduction audiogram, Spondee threshold, PB lists, Békésy tracings, Tone Decay test, and SISI test) were given once to 30 normal Ss and twice to 27 Ss with sensori-neural hearing loss. Test retest reliability coefficients and standard errors of measurement were computed for each test. The TDT test and amplitude of Békésy tracing for a continuous tone failed to differentiate effectively between normals and sensori-neurals.—M. C. Payne, Jr.

5343. Myklebust, H. R., Neyhus, A., & Mulholland, A. M. (Northwestern U.) Guidance and counseling for the deaf. *Amer. Ann. Deaf*, 1962, 107(4), 370-415.—The types of guidance problems encountered are described briefly. 8 types of information to be ascertained and evaluated are identified as: sensory abilities, intelligence, social maturity, personality, motor ability, communication abilities, interest patterns, and aptitudes. 5 case histories are presented. A list of devices which may be considered to measure the "aptitudes" is presented and characterized as to appropriate age levels and the abilities pur-

portedly measured. A related bibliography on guidance is included. (170 ref.)—*T. E. Newland.*

5344. **Studebaker, Gerald A.** (U. Oklahoma Medical Cent.) **Placement of vibrator in bone-conduction testing.** *J. speech hear. Res.*, 1962, 5(4), 321-331.—13 women and 7 men who were experienced Ss were used to compare forehead, vertex, and mastoid sites of placement of the bone-conduction vibrator in terms of threshold of audibility, intersubject and intrasubject variability, and the independence of the threshold from pathological changes in the middle ear. Lowest thresholds were obtained at mastoid position. Those measured at forehead exhibited significantly less intersubject variability than those measured from mastoid. There were no significant differences in intrasubject variability at the 3 positions. Thresholds measured from forehead were significantly less affected by middle-ear pathologies than thresholds measured from mastoid.—*M. F. Palmer.*

5345. **Zerlin, Stanley.** (Auditory Research Lab., VA, Washington) **A new approach to hearing-aid selection.** *J. speech hear. Res.*, 1962, 5(4), 370-376.—21 adult Ss with varying degrees of sensorineural involvement were studied. 6 different hearing aids were equated for gain and were presented, 2 at a time, with an input of running speech in the presence of noise. The pairs of hearing-aid outputs were simultaneously recorded onto a dual-channel tape, and the procedure repeated for all possible combinations of pairs of aids. Hearing-impaired Ss then made paired comparison choices on each set of 2 aids and ultimately generated a rank-ordered preference series. Intelligibility score results did not differentiate among the aids. Preference scores based on the paired comparison yielded clear-cut discriminations.—*M. F. Palmer.*

SPEECH DEFECTS

5346. **Albrecht, Margaret.** **A suggested neurological theory that justifies speech therapy for the adult aphasic.** *J. Rehabil.*, 1962, 28(4), 20-22.—Using Hebb's theories of learning and neural functioning and Penfield's suggestion of a central integrating system related to the reticular formation of the brain stem have led the author of this article to apply these concepts to speech therapy in adult aphasics.—*M. A. Seidenfeld.*

5347. **Arnold, G. E.** (New York Eye & Ear Infirmary) **Congenital language disability as a study model of evolution in communication.** *Lang. Speech*, 1961, 4(2), 113-132.—"The relation between various forms of congenital language disability and laterality are reviewed . . . the problem of cerebral dominance in man and its influence on linguistic activity is considered. The relevance of results with delayed auditory feed-back to such problems is discussed and the theory is presented that language disorders are the result of deficient homeostasis."—*A. E. Horowitz.*

5348. **Bankson, Nicholas W., & Byrne, Margaret C.** (Prairie Village Public Schools, Kan.) **The relationship between missing teeth and selected consonant sounds.** *J. speech hear. Discord.*, 1962, 27(4), 341-348.—304 children from a group of 444 from 18 classes of kindergarten and 1st grade were tested on a 40-item articulation test based on Tempelin's data and retested 4 months later. The original

group was divided into those with correct sound production and teeth intact, and those with incorrect production and teeth intact. A significant relationship was found between production of the initial, medial, and final /s/, and presence or absence of teeth among children who had used the sound correctly on a pretest.—*M. F. Palmer.*

5349. **Cheveleva, N. A.** (Inst. Defectology, RSFSR Acad. Pedagogical Sciences) **O zaniatiakh po ispravleniiu zaikanii v protsesse ruchnogo truda.** [Correction of stuttering by means of manual work.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 117-120.—Preschool children were trained in speech while performing different manual tasks. It was found that the work which accompanied the speech ("I cut . . .") had the most facilitating effect, less, when it referred to a past action, and the least when it referred to a future action.—*A. Cuk.*

5350. **Fillenbaum, S., Jones, L. V., & Wepman, J. M.** (U. North Carolina) **Some linguistic features of speech from aphasic patients.** *Lang. Speech*, 1961, 4(2), 91-108.—"The free speech of each of 12 adult aphasic patients was examined with reference particularly to (1) the distribution of words according to grammatical function, and (2) sequential dependencies in form-class usage, and (3) stereotypy in vocabulary. The majority of the aphasic records departed considerably from normal usage (as defined by analysis of 12 control records) with similarity among some patients in the pattern of divergence. The measures used appear to be of particular value in revealing (i) semantic difficulties in word selection and (ii) difficulties in the sequencing of speech that occur along with syntactic losses."—*A. E. Horowitz.*

5351. **Freud, Esti D.** (New York Hosp.) **Functions and dysfunctions of the ventricular folds.** *J. speech hear. Disord.*, 1962, 27(4), 334-340.—The laryngeal structures originally did not entail vocal performance but were mainly a protective sphincter mechanism for the respiratory system. It is suggested that the vocal function is to signal the female. In the author's opinion psycho-sexual trauma produce considerable midline activity of the ventricular folds. When the ventricular folds are in various states of convergence, the voice produced is symptomatic for an insecure, anxious, or even neurotic personality.—*M. F. Palmer.*

5352. **Irwin, Ruth Beckey.** (Ohio State U.) **Speech therapy and children's linguistic skills.** *J. speech hear. Res.*, 1962, 5(4), 377-381.—111 2nd-grade children from 12 schools in the Columbus Public Schools, Columbus, Ohio, with normal hearing and no physical abnormalities were divided into 3 groups: articulatory problems receiving speech therapy, articulatory problems not receiving speech therapy, and children with normal speech. Articulatory adequacy, reading readiness, word recognition, and word meaning were measured for these Ss. Results of the study provided no evidence for any definite conclusions.—*M. F. Palmer.*

5353. **Martin, Richard.** (U. Minnesota) **Stuttering and perseveration in children.** *J. speech hear. Res.*, 1962, 5(4), 332-339.—Performance on 4 motor perseveration tests was measured for 52 physically "normal" stutterers and 109 nonstutterers between the ages of 8 and 13, with IQ scores between 80 and 130. There were 39 male and 13 female

stutterers, 56 male and 53 female nonstutterers. No significant differences in preservative behavior were found between stutterers and nonstutterers as a group or in any of various combinations of age and sex.—*M. F. Palmer.*

5354. **Palmer, John M.** (U. Washington) **Tongue thrusting: A clinical hypothesis.** *J. speech hear. Disord.*, 1962, 27(4), 323-333.—A review of the clinical picture of tongue thrust and consideration of the present status of knowledge in terms of symptomatology, etiology, and therapy. The hypotheses are essentially untested, and certainly the etiological theories are untested. Objective evidence is needed.—*M. F. Palmer.*

5355. **Quarrington, Bruce, Conway, Jerome, & Siegel, Nathan.** (U. Toronto, Canada) **An experimental study of some properties of stuttered words.** *J. speech hear. Res.*, 1962, 5(4), 387-394.—27 adult stutterers (of whom 6 were females) under treatment or investigation attending the speech clinic of the Toronto Psychiatric Hospital were studied for role of grammatical function, word position, and initial phoneme in the elicitation of stuttering. Initial and terminal word positions seemed to be significant in the elicitation of stuttering. A gradient of stuttering was found, among 4 grammatical categories, which differed from gradients described in earlier investigations.—*M. F. Palmer.*

5356. **Rochford, Gerard, & Williams, Moyra.** (Littlemore Hosp., Oxford, England) **Studies in the development and breakdown of the use of names: I. The relationship between nominal dysphasia and the acquisition of vocabulary in childhood.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 222-227.—"Thirty-two adults suffering from nominal dysphasia of different degrees of severity and 120 children aged 2 to 12 years were asked to name three common objects and four of their parts. Naming these seven items showed a highly consistent order of difficulty in both groups of subjects. There was also a close parallel between the degree of difficulty presented by a name and the age at which it was acquired. Prompting by 'cues' was given for all items which could not be named. In both children and dysphasic adults, the number of cues needed to elicit a correct response increased with the difficulty of the item but the type of cue most effective was not the same in both groups below the age of 9 years."—*M. L. Simmel.*

5357. **Rochford, Gerard, & Williams, Moyra.** (Littlemore Hosp., Oxford, England) **Studies in the development and breakdown of the use of names: II. Experimental production of naming disorders in normal people.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 228-233.—"Three studies are described in which attempts were made to produce paraphasic errors in normal subjects. The conditions studied involved lowered states of awareness following ECI, the introduction of time stress, and the introduction of verbal distraction. It was found that all three conditions produced naming difficulties in subjects with otherwise 'normal' speech, and that both the errors and the patterns of breakdown were strikingly similar to those seen in organic dysphasia. A further experiment was conducted to investigate the effect of frequency of word usage on ease of naming in both normal and dysphasic subjects. Some rela-

tionship between these two factors was found but it was suggested that other variables should also be investigated."—*M. L. Simmel.*

5358. **Schuell, Hildred, Jenkins, James J., & Carroll, John B.** (U. Minnesota) **A factor analysis of the Minnesota Test for Differential Diagnosis of Aphasia.** *J. speech hear. Res.*, 1962, 5(4), 349-369.—A nonselected sample of 157 aphasic Ss on 69 tests, comprising 679 items for auditory comprehension, visual and reading performances, speech and language performances, visuomotor and writing performances, numerical relations, arithmetic processes, and body images were studied by factor analysis. There is a dimension of general language deficit in aphasia that is not modality specific. There is no support for the hypothesis of a sensory motor, a receptive-expressive, or an input-output dichotomy in aphasia.—*M. F. Palmer.*

5359. **Soderbert, George A.** (Illinois State Normal U.) **Phonetic influences upon stuttering.** *J. speech hear. Res.*, 1962, 5(4), 315-320.—15 stutterers were rated on a 7-point severity scale. 10 males and 5 females, 12-41 years of age, read to 2 listeners, the E, and an unfamiliar male listener, who was always a person with some knowledge of stuttering. 3 lists of phrases were systematically varied from S to S. Each list contained 15 5-syllable phrases totalling 50 words. In List 1 all initial sounds were vowels, in List 2 all were voiced consonants, and in List 3 all were voiceless consonants. There was no evidence of differences among vowels, voiced consonants, and voiceless consonants with respect to mean frequency or mean duration of stuttering instances.—*M. F. Palmer.*

NEUROLOGICAL DISORDERS

5360. **Batten, Frederick E.** **Ataxia in childhood.** *Developm. Med. child Neurol. Suppl.*, 1962, No. 5, 13-25.—Of historical interest is the republication, in commemoration of Batten, of his 1902 (*Lancet*) article. He proposed 3 diagnostic categories: those instances noticed from earliest life (congenital cerebellar ataxia), those appearing suddenly during or after some acute illness (acute ataxia, encephalitis cerebelli), and those appearing gradually in a child who had appeared healthy (progressive cerebellar ataxia). Prognosis was believed bad in the last group.—*T. E. Newland.*

5361. **Bergstedt, Martin; Johansson, Sverker, & Muller, Ragner.** (Medical School, Umea, Sweden) **Hereditary spastic ataxia with central retinal degeneration and vestibular impairment.** *Neurology*, 1962, 12, 124-132.—"Spastic ataxia and central retinal degeneration, affecting four members of a family, is described in this paper. In the later generations, there was also severely impaired vestibular function. . . . The main features were spastic ataxia, central retinal degeneration and impairment of the vestibular function. . . . Stiffness and unsteadiness of gait were the first symptoms; later, clumsiness of the arms and dysarthria appeared. The motor disturbances were characterized by ataxia of a cerebellar type and spasticity. Visual deterioration, including impairment of the visual acuity and color vision, developed some years after onset and progressed rapidly. Gradually, degenerative changes appeared in the retinae in the form of atrophic patches and displacement of pigment. The lesions were confined to the macular region in

two cases but appeared also in the retinal periphery in one." Spontaneous or positional nystagmus was absent, and no mental deterioration was observed.—*R. Gunter.*

5362. Garelli, Maritha. Les enfants infirmes moteurs cérébraux: Problèmes psychologiques et perspectives de recherche. [Children with cerebral motor conditions: Psychological problems and research perspectives.] *Psychol. Franc.*, 1962, 7(2), 102-110.—Difficulties of measuring the intelligence of motor defective children using existing tests are analyzed; problems relating to perceptual difficulties and emotional problems are discussed. Some suggestions for a thorough longitudinal research program are offered.—*C. J. Adkins.*

5363. Ingvar, David H., & Nyman, G. Eberhard. (U. Lund, Sweden) Epilepsia arithmetica: A new psychologic trigger mechanism in a case of epilepsy. *Neurology*, 1962, 12(4), 282-287.—A case report of a 19-year-old woman whose performance of arithmetic problem solving acted as a trigger mechanism for minor epileptic seizures.—*R. Gunter.*

5364. Lasater, Gene M. Reading epilepsy. *Arch. Neurol., Chicago*, 1962, 6(6), 492-495.—4 cases are presented where major motor seizures occurred during, and only during a period of sustained reading. A review of these 4 cases, together with the 20 reported to date in the literature, indicate that (a) treatment with anticonvulsant medication is usually unnecessary since patients learn to avoid seizures by terminating their reading as soon as involuntary jaw movements begin to occur frequently, and (b) the exact conditions necessary for the precipitation of seizures during reading are "at this time unknown," although the reported incidence of 2 cases in 1 family suggests that a genetic factor may be involved.—*H. D. Arbitman.*

5365. Mani, K. S. The problem of epilepsy: Part III. *Pratibha*, 1959, 2(2), 33-44.—The treatment of epilepsy can be approached from the point of view of medical treatment, surgery, and as a social problem. The various drugs and surgical treatments are discussed. Suggestions are offered to deal with epilepsy as a social problem.—*U. Pareek.*

5366. Mavor, Huntington, & Libman, Israel. (McGill U., Montreal) Motor nerve conduction velocity measurement as a diagnostic tool. *Neurology*, 1962, 12(11), 733-744.—A description of the authors' experiences with a simple method for measuring conduction velocities of peripheral motor nerves, and a report of the following data on normal Ss: conduction velocity of 9 ulnar nerves in 7 Ss ranged from 56.0 to 62.7 meters per second; range of terminal conduction time on stimulation at the wrist was 2.3 to 3.4 meters per second.—*R. Gunter.*

5367. Mueller, A. D. Pain study of paraplegic patients. *Arch. Neurol., Chicago*, 1962, 7(4), 355-358.—Previous studies indicate that the more stable personality should react more favorably than the unstable in elimination of intractable pain by a chordotomy. The Rorschach was administered to patients in both the experimental and the control groups. Harrower-Erickson's "neurotic" Rorschach scale yielded a mean weighted score of 9.5 for the control group; the hypothesis was that patients with scores at or below 9.5 are good prospects for relief of pain by means of chordotomy, while those with scores above

9.5 are not. Predictions based on these figures were made, and predictions compared with postoperative results show a prediction percent of 85.7. "This is 35.7% better than . . . chance."—*H. D. Arbitman.*

5368. Scheibel, Arnold; Markham, Charles, & Koegler, Ronald. (U. California Medical Center, Los Angeles) Neural correlates of vestibuloocular reflex. *Neurology*, 1961, 11(12), 1055-1065.—"The high incidence of vestibuloocular abnormalities in schizophrenic children suggested the advisability of searching the brain stem and subcortex for regions modulating nystagmus responses." The work was done on 70 adult cats; 35 acute preparations produced useful information. The following findings were reported. "Consistent, apparently inhibitory responses were obtained from the [brain-stem reticular core] . . . and its rostral projections through the zona incerta and lateral hypothalamus. . . . they were due to nonreciprocally increased tension in all extraocular muscles. . . . Stimulation of the nucleus of Darkschewitsch . . . [produced] a true inhibition of all extraocular muscles with relaxation of the eyeball in the socket. . . . Stimulation of the entire central core of thalamic reticular nuclei . . . produced augmentation of nystagmus. A small dorsolateral island just medial to the lateral geniculate had similar effects. Stimulation of the entire head and body of the caudate increased the amplitude of nystagmus . . . surrounding white matter of internal capsule and corona was generally inhibitory. Physiologic and behavioral consequences of stimulation and/or ablation of these areas were considered. . . . Two separate groups of effects were noted [as effects of caudate stimulation]. . . . Both sets of phenomena were reminiscent of certain patterns shown by schizophrenic children."—*R. Gunter.*

5369. Stevens, Janice R. (U. Oregon) Endogenous conditioning to abnormal cerebral electrical transients in man. *Science*, 1962, 137(Whole No. 3534), 974-976.—10 Ss with epilepsy were trained to press a lever to avoid a mildly painful shock each time paroxysmal epileptiform activity occurred in their own electroencephalogram. All Ss learned to avoid the shock as long as they could hear the electroencephalogram and respond to the characteristic change in sound accompanying each spike-wave burst. When the audio component of the electroencephalogram was eliminated, only 1 S was able to respond to the purely subjective effect of his own paroxysmal activity.—*Journal abstract.*

5370. Talland, George A. (Harvard Medical School, Cambridge, Mass.) Cognitive function in Parkinson's disease. *J. nerv. ment. Dis.*, 1962, 135(3), 196-205.—A group of 45 Parkinsonian patients studied for the disease's effect on cognitive functions showed no definite signs of impairment by comparison with a control group.—*N. H. Pronko.*

5371. Vinoda, K. S. (All-India Inst. Mental Health) The Bender-Gestalt performance of epileptics. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 62-69.—The aim of the study was to determine how far Bender-Gestalt reproductions: (a) differentiate epileptics from normals, (b) are related to EEG abnormalities, and (c) are related to the severity of illness. The Bender-Gestalt Test was administered to a group of 50 epileptics and a matched control group of 25 normals. Significant differences were obtained

between the 2 groups in speed of performance and accuracy of reproduction of Bender-Gestalt figures. The study demonstrated the usefulness of the test with epileptics.—J. DiGiovanni.

Brain Damage

5372. Arutiunova, A. S., & Blinkov, S. M. (Burdenko Inst. Neurosurgery, USSR Acad. Medical Sciences) **Latentnyi period dvigatel'noi reaktsii pri gemianopsii.** [Motor RT in cases of hemianopia.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 432-436.—Ss were 3 patients with tumors in the posterior part of the right cerebral hemisphere, and consequent complete left side hemianopia. Reaction time (RT) to visual and auditory stimuli was recorded separately for the right and left hand. The RT for the left hand was longer than the RT for the right hand, from 4.2 to 6.5 msec. for the visual stimulus, and from 8.3 to 10.2 msec. for the auditory stimulus.—A. Cuk.

5373. Benton, Arthur L., & Fogel, Max, L. **Three-dimensional constructional praxis: A clinical test.** *Arch. Neurol., Chicago*, 1962, 7(4), 347-354.—Constructional praxis is a broad concept applied to activities which require a patient to assemble, join, or articulate parts to form a single unitary structure in 2 or 3 spatial dimensions. Ss were 100 patients with disease or injury involving the cerebral hemispheres, and 100 patients with a variety of somatic disturbances but no evidence or history of cerebral disease or injury. The test battery included 3 3-dimensional constructional praxis tasks; the Visual Retention Test; and the Comprehension, Arithmetic, Similarities, and Digit Span subtests of the WAIS. A "significant proportion" of patients with cerebral disease performed defectively on the 3-dimensional constructional praxis test, their constructions differing qualitatively as well as quantitatively from those of control patients.—H. D. Arbitman.

5374. Bruell, J. H., & Albee, G. W. (Western Reserve U.) **Higher intellectual functions in a patient with hemispherectomy for tumors.** *J. consult. Psychol.*, 1962, 26(1), 90-98.—Wechsler, Rorschach, Draw-a-Person, and behavioral observation are presented with drawings and protocol. "The case confirms earlier findings of a remarkable, but by no means complete, preservation of higher mental functions following cerebral hemispherectomy."—E. R. Otting.

5375. Dureau, F. (Hôpital Ste. Anne, Paris, France) **Troubles mentaux dans les lésions de l'hypophyse et de l'hypothalamus: I. Les syndromes endocriniens hypophysaires.** [Mental disturbances associated with lesions of the hypophysis and hypothalamus: I. Endocrine syndromes of the hypophysis.] *Encephale*, 1962, 51(3), 263-294.—The literature dealing with psychopathology resulting from pituitary dysfunction is reviewed. Acromegaly is often accompanied by personality changes (apathy, character changes which are more often depressive than euphoric) but psychosis is not more frequent. Gigantism is sometimes accompanied by apathy and disturbed social relations; impairment of intelligence is disputed. Cushing's syndrome is frequently associated with depression and suicidal tendencies, but clinical reactions can be quite varied. Hypopituitarism is associated with a particular mental condition marked by apathy, indifference, and depression. Acute

psychotic reactions are delusional and often linked with hypoglycemia." (138 ref.)—W. W. Meissner.

5376. Ettlinger, G., & Hurwitz, L. (National Hosp., London, England) **Dyslexia and its associated disturbances.** *Neurology*, 1962, 12(7), 477-480.—"A disorder of reading, it is agreed, may be the major consequence of involvement of the cerebral cortex from injury or disease. Such a defect has then sometimes been termed 'pure word blindness.' This designation suggests that letters can still be read whenever words cannot, and that no other disturbance is contributing to the defect of reading. Neither implication accords with the evidence." The authors describe 3 patients of which 2 have "visual symbolic dyslexia associated with other defects" while the 3rd patient suffers from "perceptual disorganization... without a genuine symbolic dyslexia." The authors chose these cases because "they illustrate that, with a disorder of reading, there may be severe and varying associated disturbances in the presence or absence of a genuine symbolic loss," and therefore conclude that "dyslexia may occur as a selective symbolic defect which may be recognized whatever the accompanying associated disturbances."—R. Gunter.

5377. Fogel, M. L. (U. Iowa) **The Gerstmann syndrome and the parietal symptom-complex.** *Psychol. Rec.*, 1962, 12, 85-99.—Assessment of 100 patients with cerebral damage was determined on the Gerstmann index and 15 other tests. With age and education held constant the intercorrelations among these performances were obtained. Results indicated that a single common factor can account for the observed intercorrelations pertinent to Gerstmann syndrome, per se, that this factor cannot account for all the observed intercorrelations of the total "parietal symptom-complex," as defined in this study, and "that the general factor found in the Gerstmann syndrome is not confined to these deficits, but extends to a number of other 'parietal' performances."—R. J. Seidel.

5378. Geschwind, Norman, & Kaplan, Edith. (Massachusetts Inst. Technology) **A human cerebral disconnection syndrome.** *Neurology*, 1962, 12(10), 675-685.—Discussion of the symptomatology of a patient who behaves as if there were 2 independently functioning half-brains, and comparison with some of Sperry's findings on animals with sections of the corpus callosum.—R. Gunter.

5379. Gochman, Stanley I., & Grubler, Eva R. (Rutgers) **A study of brain damage in a suburban population.** *Psychol. Rep.*, 1962, 10, 828.—Of 47 children referred to a mental hygiene clinic because of psychological difficulties, 67% were judged to be brain-damaged on the basis of interview behavior and a psychological test battery.—B. J. House.

5380. Grubler, Eva R., & Gochman, Stanley I. (Somerset County Guidance Cent.) **Statistical observations regarding the clinical diagnosis of brain damage.** *Psychol. Rep.*, 1962, 11(1), 221-222.—Results of neurological, EEG, and psychiatric examinations are reported for a sample of 25 children judged to be brain-damaged on the basis of a psychological test battery.—B. J. House.

5381. Kiev, Ari; Chapman, Loring F., Guthrie, Thomas, C., & Wolff, Harold G. (New York City Hosp.) **The highest integrative functions and diffuse cerebral atrophy.** *Neurology*, 1962, 12(6), 385-393.—A pneumoencephalographic study of 20

adult Ss with diffuse loss of tissue from cerebral hemispheres. "In 19 subjects with diffuse loss of cerebral tissue due to slowly progressive degenerative disease and in one with loss due to birth injury, impairment of the highest integrative functions was assessed and related to the extent of cerebral tissue loss. . . . In these subjects, impairment was found in all categories of the highest integrative functions previously found to be impaired in subjects with focal loss of tissue from the cerebral hemispheres. . . . (learning, memory, categorization, and so on). . . . It is concluded that the degree of impairment of the highest integrative functions is directly related to the total number of inadequately functioning cortical neurons."—*R. Gunter.*

5382. Rowley, V. N. (State U. Iowa) **Analysis of the WISC performance of brain damaged and emotionally disturbed children.** *J. consult. Psychol.*, 1961, 25(6), 553.—With matched emotionally disturbed and brain damaged children, there was no significant difference between verbal or performance IQs or subtest scores, nor were differences between scores significant.—*E. R. Oetting.*

5383. Schein, J. D. (Gallaudet Coll.) **Cross-validation of the Continuous Performance Test for brain damage.** *J. consult. Psychol.*, 1962, 26(2), 115-118.—Patients with cortical brain damage and psychotics score lower than neurotic, neuropsychiatric, or hospitalized patients. Those with subcortical damage do not differ. Intelligence is correlated .26, age is not related, and medication has no effect. Diffuse EEG is lower than focal, borderline, or normal.—*E. R. Oetting.*

5384. Serafetinides, Eustace A., & Falconer, Murray A. (Guy's-Maudsley Neurosurgical Unit, London, England) **Some observations on memory impairment after temporal lobectomy for epilepsy.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 251-255.—Clinical assessment of 34 patients after a non-dominant temporal lobectomy revealed recent memory impairment in 7 patients 2-9 yrs. post-operative; the defect was neither disabling nor substantiated on psychometric tests. 6 of these 7 patients also had a post-operative EEC spike focus in the nonoperated temporal lobe, and a higher incidence of persistent epilepsy. "It is argued that the presence of spike-discharging focus at the opposite sphenoidal electrode indicates a dysfunction of that temporal lobe, if not a lesion. Therefore such cases can be considered as showing bilateral temporal lobe disturbances which are responsible for the memory defect." (2 tables, 16 ref.)—*M. L. Simmel.*

5385. Spivack, G. (Devereux Found. Inst. Research & Training Devon, Penn.) **A note on generality of discrimination deficiency in life-long brain damage.** *Amer. J. ment. Defic.*, 1962, 67(3), 473-474.—Data on the relationship between performances of brain damaged children on a visual and auditory discrimination task are reported. Results are presented which support the notion that there is a general discriminatory deficiency in life-long brain damaged individuals.—*V. S. Sexton.*

5386. Teuber, H.-L., & Rudel, R. G. (Massachusetts Inst. Technology) **Effects of brain injury in children and adults.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology*. Vol. 4. *Clinical psychology* (see 37:

4119). Pp. 113-139.—4 groups of Ss (adults with gunshot wounds, persons with certain brain disease, children, and monkeys) were examined. Recent results are summarized. (39 ref.)—*B. T. Jensen.*

5387. Tikhomirov, O. K. (Dept Psychology, Moscow State U., USSR) **Issledovanie optimal'nykh sposobov proverki gipotez v norme i patologii. Soobshchenie III. Narushenie osiazatel'nogo uznaniia slozhnykh izobrazhenii.** [Study of optimal methods for checking hypotheses in normal and abnormal cases. Communication III. Disturbance of tactile recognition of complex images.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 6, 65-68.—1 female S suffering from a local injury in the left frontal lobe was asked to recognize by touch 2 checkers representing the letters N and P on a checkerboard of 25 cells. The probability of recognition was $\frac{1}{2}$. 2 experiments were carried out and the results show that a great amount of "superfluous information" was necessary for the search and was not improved even with training.—*A. Cuk.*

5388. Warrington, Elizabeth K. (National Hosp., Queen's Square, London, England) **The completion of visual forms across hemianopic field defects.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 208-215.—"Single geometrical forms were presented by means of a tachistoscope to a series of patients with homonymous hemianopia in such a way that only half of each form fell within the intact half field of vision. The results showed that some patients reported seeing only those sections of the forms that were objectively visible, and in this way resembled normal control subjects, but others reported seeing complete forms although it was not possible for them actually to have done so. This tendency to 'complete' forms across homonymous hemianopic field defects was found to be strongly associated with the presence of a parietal lobe lesion of either hemisphere, as well as with the symptom of unawareness of field defect. Some possible explanations of the phenomenon of 'completion' are discussed, and attention is drawn to its localizing value for parietal lobe disease." Appendix with individual case summaries.—*M. L. Simmel.*

5389. Watkins, E. S., & Oppenheimer, D. R. (Radcliffe Infirmary, Oxford, England) **Mental disturbances after thalamolysis.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 243-250.—"This report concerns two patients, in both of whom the placing of a lesion in the left thalamus, for the purpose of controlling Parkinsonian tremor and rigidity, resulted in a severe and protracted psychic disturbance, characterized by confusion, amnesia, confabulation, and euphoria. One of these patients died, from other causes, nine months after operation. A detailed anatomical and histological examination was carried out on the brain, primarily in order to define the nature and extent of the lesion."—*M. L. Simmel.*

5390. Williams, H. L., Giesecking, C. F., & Lubin, A. (Walter Reed Army Inst. Research) **Interaction of brain injury with peripheral vision and set.** *J. consult. Psychol.*, 1961, 25(6), 543-548.—On the block design rotation test, brain injured show less decrease in rotation when instructed to attend to tilt. Restriction in peripheral vision decreases rotation for brain injured and increases for both normal and dull normal controls. ". . . relevant peripheral cues cause perceptual distortion."—*E. R. Oetting.*

Cerebral Palsy

5391. Allen, Robert M., & Jefferson, Thomas W. (U. Miami, Fla.) **Psychological evaluation of the cerebral palsied person: Intellectual, personality, and vocational applications.** Springfield, Ill.: Charles C Thomas, 1962. xiii, 86 p. \$5.00.—A detailed evaluation of testing techniques for the cerebral palsied individual based on the assumption that he must be evaluated in terms of the nonhandicapped. Tests on intellectual, personality, and vocational assessment are reviewed. Intelligence tests are considered from the standpoint of whether they are directly administrable or whether they depend upon an informant. The need for understanding sensorimotor limitations is stressed. A brief illustrative account of research findings with the various personality tests is given. The role of self-concept in vocational choice and problems with vocation are also noted. (126 ref.) —B. S. Aaronson.

5392. Ferrari, Joan Ann. **Intensive stereognostic training: Effect on spastic cerebral palsied adults.** *Amer. J. occup. Ther.*, 1962, 16(3), 141-142.—The spastic cerebral palsied often suffers loss of the ability to perceive form tactually without the aid of vision. In this study, 5 males and 3 females (ages 16-31) compared 2 dissimilar forms, using first the uninvolved hand and later the involved hand (in 19 training sessions of 20 minutes duration during a 3-5 week period). It was found that large objects worked better than smaller ones in bringing about some degree of improvement in stereognosis.—M. A. Seidenfeld.

5393. Mednick, S. A., & Wild, C. (U. Michigan) **Stimulus generalization in brain damaged children.** *J. consult. Psychol.*, 1961, 25(6), 525-527.—Cerebral palsied children, capable of a visual motor reaction time task, showed less stimulus generalization to inappropriate lights than normals.—E. R. Oetting.

MENTAL RETARDATION

5394. Barrett, Beatrice H., & Lindsley, O. R. (Harvard Medical School) **Deficits in acquisition of operant discrimination and differentiation shown by institutionalized retarded children.** *Amer. J. ment. Defic.*, 1962, 67(3), 424-436.—Some findings from the first year of a continuing laboratory investigation of the operant behavior of a representative group of institutionalized children are described. The research focused on the location and automatic measurement of clinically and educationally relevant behavior deficits in a controlled experimental environment. The method of simultaneous and independent measurement of response differentiation and stimulus discrimination was sensitive to a variety of reliable individual response patterns, including a wide range of deficits. Most of the latter were revealed only through repeated, continuously recorded, controlled observations over many experimental sessions. Individual variability, both between sessions and within sessions, is extreme enough in some cases to demand prolonged study. The authors feel that the nature and amount of individual variability emerges as an important and basic datum rather than as statistical "noise" or therapeutic failure.—V. S. Sexton.

5395. Berkson, G., & Cantor, G. N. (Emory U.) **A note on method in comparisons of learning in normals and the mentally retarded.** *Amer. J. ment.*

Defic., 1962, 67(3), 475-477.—Some of the empirical and logical issues involved in reaching conclusions about how normals and retardates differ with respect to performance curve parameters are analyzed.—V. S. Sexton.

5396. Charles, D. C., & McGrath, Kay. (Iowa State U.) **The relationship of peer and staff ratings to release from institutionalization.** *Amer. J. ment. Defic.*, 1962, 67(3), 414-417.—164 children and adolescents who had earlier been the Ss of a study of sociometric and staff rating relationship in an institution for the mentally deficient were followed up to determine whether social ratings are useful predictors of release and of adjustment after release. It was found that (a) there were significant differences between retained and released groups, (b) the type of rating (staff or peer) was significant, and (c) staff rankings were higher for released than for retained groups and thus were better predictors of release than peer ratings. Peer ratings were not found useful enough in prediction of release or success of adjustment to warrant their use for that purpose.—V. S. Sexton.

5397. Cruz, Caridad E., & Barnett, Nadine. (Indiana U. School Medicine, Indianapolis) **Mental retardation in pseudo-pseudohypoparathyroidism: Case reports of siblings and review of literature.** *Amer. J. ment. Defic.*, 1962, 67(3), 381-395.—A description is presented of 10 generations of the family of 2 sisters with pseudo-pseudohypoparathyroidism. Strong incidence of mental retardation, of mental retardation combined with physical defects characteristic of pseudo-pseudohypoparathyroidism, of psychiatric difficulties, and of other neurological or developmental defects, was found. Most of the families of 49 other patients reported in the literature are positive for defects, whether physical or mental, which are similar to the patients', or are incomplete variations of the pseudo-pseudohypoparathyroidism syndrome. A genetic origin of the syndrome is suggested from the present study and from other reports in the literature.—V. S. Sexton.

5398. Curzon, Winifred M. (London, England) **Training of mentally handicapped children in day training centers.** *Develpm. Med. child Neurol.*, 1962, 4(5), 537-541.—The methods employed are described briefly, the need for better trained personnel is indicated, the importance of coordination of efforts between the teachers and those in industrial centers is stressed, and special problems are discussed.—T. E. Newland.

5399. De La Cruz, F. F., & La Veck, G. D. (Rainier School, Buckley, Wash.) **Tuberous sclerosis: A review and report of eight cases.** *Amer. J. ment. Defic.*, 1962, 67(3), 369-380.—A review is presented of tuberous sclerosis, with its multiple-system involvement, which is characterized in its classic form by adenoma sebaceum, calcific cerebral depositions, epilepsy, and mental retardation. It is emphasized that, in view of its genetic implications and for more realistic planning of the patient's future, an early and accurate diagnosis is mandatory. Normal intellectual endowment and asymptomatic cases are mentioned. 8 cases are presented. It is felt that this condition is not as rare as previous reports maintained.—V. S. Sexton.

5400. Dentler, R. A., & Mackler B. (U. Kansas) **The Porteus Maze Test as a predictor of functioning abilities of retarded children.** *J. consult. Psychol.*, 1962, 26(1), 50-55.—The Porteus Maze predicts (a) ability of the child to identify landmarks and paths on a map; (b) language ability; and (c) social maturity, as measured by activities based on the Vineland Social Maturity Scale. Clinical use of discrepancies is discussed.—E. R. Oetting.

5401. Garell, Dale. (U. Colorado Medical Cent.) **Metabolic defects associated with mental retardation.** *Amer. J. Dis. Children*, 1962, 104(4), 401-418.—A review of medical, genetic, and biochemical knowledge of inborn errors of metabolism that may result in mental retardation. (114 ref.)—A. B. Warren.

5402. Gibbs, E. L., & Gibbs, F. A. (U. Illinois) **Extreme spindles: Correlation of electroencephalographic sleep pattern with mental retardation.** *Science*, 1962, 138 (Whole No. 3545), 1106-1107.—An electroencephalographic abnormality is described which is relatively common among children below 12 years of age who are mentally retarded. This pattern consists of exaggerated sleep spindles, which are of higher voltage and more continuously present than in normal persons, and it correlates specifically with mental retardation and not with epilepsy or cerebral palsy.—*Journal abstract.*

5403. Girardeau, F. L. (Parsons State Hosp., Kan.) **The effect of secondary reinforcement on the operant behavior of mental defectives.** *Amer. J. ment. Defic.*, 1962, 67(3), 441-449.—This study aimed to demonstrate secondary reinforcement and to study the effects of intermittent and continuous presentation of both primary and secondary reinforcing stimuli on the establishment of secondary reinforcement. Operant levels were obtained for 4 groups of male defectives (IQ range 12-48) and then different secondary reinforcement training treatments were administered. No evidence for the establishment of secondary reinforcement was obtained. No significant relationships were found between operant level rate and MA, CA, IQ, diagnostic category, and presence or absence of medication.—V. S. Sexton.

5404. Goda, Sidney, & Griffith, Belver C. (American Psychological Ass.) **Spoken language of adolescent retardates and its relation to intelligence, age, and anxiety.** *Child Developm.*, 1962, 33(3), 489-498.—"The present study offered descriptive data on the spoken language of high-grade adolescent retardates and examined the interrelations of sentence usage measures, developmental measures, sex, race, and anxiety. Correlations were obtained among all measures, and the results were factor analyzed. Of the 3 rotated factors, one was closely identified with MA and IQ; another with tense variety, CA, sex, and manifest anxiety; and a third with the sentence usage measures, particularly sentence complexity."—W. J. Meyer.

5405. Goda, S., & Rigrodsky, S. (Burke Rehabilitation Found., White Plains, N. Y.) **Auditory Training procedures of certain mentally retarded children.** *Train. Sch. Bull.*, 1962, 59(3), 81-88.—The erratic hearing behavior which may be found in mentally retarded children is described. Several investigators have observed similar reactions among the brain-injured. Hearing responses are affected by

environment and materials to which they are responding. With care for these 2 factors hearing responses can be improved. While the child usually uses both vision and hearing in responding to verbal symbols, there are periods where he uses his hearing exclusively. Careful attention should be paid to the maximum stage the child can reach when relying on his hearing exclusively. Attention should be directed to the length of the spoken sentence, the rate of speech, the kinds of sentences, and syntactical arrangements of words.—V. S. Sexton.

5406. Green, Calvin, & Zigler, Edward. (Yale U.) **Social deprivation and the performance of retarded and normal children on a satiation type task.** *Child Developm.*, 1962, 33(3), 499-508.—Groups of normal, retarded-noninstitutionalized, and retarded-institutionalized children played a simple monotonous game until satiated. $\frac{1}{2}$ the Ss in each group played the 2 highly similar parts of the game in a support to nonsupport reinforcement sequence. The sequence was reversed for the remaining $\frac{1}{2}$ of the Ss. Performance of the normal and retarded-noninstitutionalized Ss were quite similar but differed from that of the retarded-institutionalized Ss. A motivational hypothesis, emphasizing social deprivation, was used to explain the results.—W. J. Meyer.

5407. Guskin, S. (George Peabody Coll. Teachers) **The influence of labelling upon the perception of subnormality in mentally defective children.** *Amer. J. ment. Defic.*, 1962, 67(3), 402-406.—42 college students saw films of a girl and boy, each about 10 years old, with IQs of about 50. Each student rated each child twice, first without sound and then with verbal cues, on a series of 5 alternative adjective choices. $\frac{1}{2}$ of the student-judges were told that both children were mentally retarded, and the other $\frac{1}{2}$ were controls and were told only that these were school children. 5 of the adjective choices were combined into a single index of "perceived subnormality." It was discovered that whereas the label had no discernible effect at all upon the judgment of one child, the other child was reliably judged as more subnormal when he had been labelled retarded. On the basis of certain apparent characteristics of the children it was suggested that perhaps labelling a child as mentally subnormal can influence his perceived subnormality only when 2 conditions are met: (a) the child himself presents relevant cues to his subnormality, and (b) these cues are ambiguous in their implications.—V. S. Sexton.

5408. Hetherington, E. M., & Banta, Thomas J. (U. Wisconsin) **Incidental and intentional learning in normal and mentally retarded children.** *J. comp. physiol. Psychol.*, 1962, 55(3), 402-404.—Organic retardates, familial retardates, and normal children of the same mental age received several learning and retention tasks. Organic retardates learned less incidentally than the other groups. No differences were found on a recall test 48 hr. later, but they reappeared on a recognition test. No other differences were found, and no significant correlations were found between incidental and intentional learning or retention.—W. A. Wilson, Jr.

5409. House, Betty, & Zeaman, David. (Mansfield State Training School) **Reversal and non-reversal shifts in discrimination learning in re-**

retardates. *J. exp. Psychol.*, 1962, 63(5), 444-451.—“Mentally defective children were trained on a discrimination problem with either color relevant and form irrelevant, or the opposite. One group had the irrelevant cue varied randomly during training; the other had a constant irrelevant cue. Following training, Ss learned either a simple reversal, a new problem with stimuli from the same relevant dimension (intradimensional shift), or a new problem with stimuli from the irrelevant training dimension (extradimensional shift). Extradimensional shift was significantly more difficult than either reversal of intradimensional shift. Reversal and intradimensional shift performance did not differ. The results were interpreted as consistent with observing response theory, but suggestive of changes for a verbal mediation theory.” (18 ref.)—*J. Arbit.*

5410. Hollis, J. H. (Parsons State Hosp., Kan.) **Solution of bent-wire problems by severely retarded children.** *Amer. J. ment. Dec.*, 1962, 67(3), 463-472.—13 severely retarded institutionalized children were tested on a series of 40 bent-wire detour problems for a total of 480 trials. The retardates as a group performed at a level below that of the normal 2-year-old child. The performance for the group of retardates approximated that of monkeys—that is, a relatively slow and gradual approach to the solution of the bent-wire problems. Pattern-related factors that seem to contribute to the relative difficulty of patterns were observed to be the same for all species and ages. Subjective observations or accessory behavioral changes in the retardates were discussed.—*V. S. Sexton.*

5411. Jones, R. Wayne, & Ellis, Norman R. (Louisiana State U.) **Inhibitory potential in rotary pursuit acquisition by normal and defective subjects.** *J. exp. Psychol.*, 1962, 63(6), 534-537.—“The present experiment compared normals and defectives under conditions of massed and distributed practice on the rotary pursuit task. Over-all, normal Ss showed a larger build-up of inhibition than the defectives although this effect could not be demonstrated independently of performance level and distribution of practice. There were sex differences in both pretest and and posttest performance. There were some characteristics of posttest performance which could be ascribed to the development of a ‘permanent’ inhibition effect.”—*J. Arbit.*

5412. Kern, W. H., & Pfaeffle, H. (U. Wisconsin) **A comparison of social adjustment of mentally retarded children in various educational settings.** *Amer. J. ment. Defic.*, 1962, 67(3), 407-413.—The social adjustment of mentally retarded children in 3 educational settings was compared: special classes, special school, and regular classes. 93 Ss, 31 in each setting, were studied by means of the Social Adjustment section of the California Test of Personality, Elementary Form. 1 of 2 examiners read the test questions to each S individually and scored the test objectively by key. The special school children showed the best over-all social adjustment. The regular class retardates showed the poorest over-all adjustment. The special class children held an intermediate position on social adjustment. There was no statistically significant difference between the mean scores of the special class and special school pupils on any of the 6 sub-tests. The scores of the

special school children were, however, slightly higher. The greatest differences were found in school relations in which the special class and special school groups showed significantly superior adjustment over the regular school retardates.—*V. S. Sexton.*

5413. Linde, T. (207 E. Buffalo St., Milwaukee, Wis.) **Techniques for establishing motivation through operant conditioning.** *Amer. J. ment. Defic.*, 1962, 67(3), 437-440.—Motivating the retarded in workshops requires teaching the notion that a specific behavior, work, will be rewarded. Several methods for establishing motivation through operant conditioning are discussed.—*V. S. Sexton.*

5414. Macmillan, M. B. (Mental Hygiene Authority, Victoria, Australia) **Adjustment and process: A neglected feature of follow-up studies of retarded people.** *Amer. J. ment. Defic.*, 1962, 67(3), 418-423.—Consistency in parental trial-leave contacts seemed to have a highly significant association with the present status of the group of mentally retarded boys in this study. This may have its determinants in parental attitudes toward the retarded child, in general, and particularly at the time of placement in an institution. If this is so, later adjustment should be viewed as the end point of a process rather than as the result of relatively fixed specific characteristics of either parent or child.—*V. S. Sexton.*

5415. O'Connor, N., & Hermelin, Beate. (Maudsley Hosp., U. London, England) **Recall in normals and subnormals of like mental age.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 81-84.—Normal children and young adult imbeciles were matched for mental age and were given sets of 6 pairs of words to learn by association. The words were recorded on tape, and presented to subgroups at a sound intensity of 90 db. or 55 db. Each subgroup was further subdivided— $\frac{1}{2}$ the Ss being given 10 and $\frac{1}{2}$ given 20 repetitions. 1 minute, 2 days, and 1 month later they heard the stimulus word of each pair and were asked to give the appropriate response word. It was shown that there was no difference in learning or memory scores between normals and imbeciles. Frequency of presentation affected immediate recall scores of both groups, with intensity level contributing to a lesser degree. Memory over longer time intervals was determined by the amount initially learned, rather than by the conditions under which such learning had occurred.—*Journal abstract.*

5416. Olshansky, S., & Sternfeld, L. (Children's Developmental Clinic, Cambridge, Mass.) **Attitudes of some pediatricians toward the institutionalization of mentally retarded children.** *Train. Sch. Bull.*, 1962, 59(3), 67-73.—Little evidence was found to support the views that pediatricians favor early institutionalization. Few pediatricians considered the decision to institutionalize as belonging to the parents. The majority of the pediatricians interviewed for this study saw few children in the course of their daily practices whom they identified as mentally retarded.—*V. S. Sexton.*

5417. Reger, Roger, & Dawson, Antoinette. (Wayne County Training School, Mich.) **The hyperactive educable mentally retarded child.** *Amer. J. occup. Ther.*, 1962, 16(4), 182-184.—The goal of the occupational therapist in treating the hyperactive child is to reduce his hyperactivity by providing him

with therapeutically acceptable uses for his energies so that he does not come into conflict with his environment. He is taught self-control and encouraged to engage in activities that are generally more controlled by using a system of rewards and punishments stemming from the interactional process and his own better management of his self-needs.—*M. A. Seidenfeld.*

5418. Shimizu, M. (Kyoto U.) [An experimental study of the developmental process of conceptualization.] *Jap. J. Psychol.*, 1962, 33(2), 71-83.—An investigation of Vinacke's hypothesis, which assumes a parallel relationship between intelligence and conceptual ability found that there was an increase in responses of the conceptual type as a function of increasing MA in mentally retarded Ss. However, there were no differences between normal Ss of a previous study and the retarded Ss of the present study with regard to this finding—both showed an increase in conceptual responses with increase in MA. However, differences in qualitative characteristics were noted between these groups, with the retarded Ss manifesting a more primitive mental apparatus.—*A. Barclay.*

5419. Silverstein, A. B., & Mohan, P. J. (Pacific State Hosp., Pomona, Calif.) Performance of mentally retarded adults on the Color Form Sorting Test. *Amer. J. ment. Defic.*, 1962, 67(3), 458-462.—50 mentally retarded adults took the Color Form Sorting Test from the Goldstein-Scheerer battery which was scored by a system designed for this study. Patterning, verbalization, shifting, and color vs. form were found not to be significantly related to age, sex, intelligence, diagnosis, or length of hospitalization. These findings were contrasted and compared with those of other studies. Retardates appear to differ from normals in several aspects of performance, but differences among retardates have not been clearly demonstrated.—*V. S. Sexton.*

5420. Silverstein, A. B., Shotwell, Anna M., & Fisher, G. M. (Pacific State Hosp., Pomona, Calif.) Cultural factors in the intellectual functioning of the mentally retarded. *Amer. J. ment. Defic.*, 1962, 67(3), 396-401.—The performance of 53 Mexican mental retardates on the WAIS was compared with that of 251 controls. The mean Performance IQ of the Mexicans was significantly higher than that of the controls. The Mexicans and the controls did not differ significantly on the Verbal or Full Scale IQs. The discrepancy between the mean Verbal and Performance IQs was completely negligible for the controls, whereas for the Mexican patients, this discrepancy was highly significant in favor of the Performance IQ. On the Verbal Scale, the controls obtained significantly higher mean scores than the Mexicans on Information and Vocabulary. On the performance subtests, the Mexican patients obtained significantly higher mean scores than the controls on Digit Symbol, Block Design, and Object Assembly. The Mexican patients and the controls did not differ significantly on Cohen's Verbal Comprehension and Memory factors, but the mean score of the Mexican patients on the Perceptual Organization factor was significantly higher than that of the controls. The relatively small differences between the 2 groups suggest that clinical psychologists should be careful in making allowances for cultural factors in the intel-

lectual functioning of the mentally retarded.—*V. S. Sexton.*

5421. Throne, Frances M., Schulman, J. L., & Kaspar, J. C. Reliability and stability of the Wechsler Intelligence Scale for Children for a group of mentally retarded boys. *Amer. J. ment. Defic.*, 1962, 67(3), 455-457.—3-4 mo. after the original test the same examiner retested on the WISC 39 mentally retarded boys, ages 11-0 to 14-11, with original WISC IQs in the retarded range. The correlation coefficients indicate that the Verbal, Performance, and Full Scale IQ scores are reliable. The reliability of the Comprehension, Arithmetic, Picture Completion, Block Design and Coding subtests was adequate; but the reliability of the remaining subtests was somewhat less than adequate. The means of the Verbal, Performance, and Full Scale IQ scores showed no significant gains (or losses) between the 1st and 2nd administrations—a further indication of the stability of the WISC for this population.—*V. S. Sexton.*

5422. Verghese, A., & Murti Rao, D. L. N. (All-India Inst. Mental Health) Mongolism: A review of some aspects. *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 20-36.—The purpose is to describe findings in 18 cases of mongoloids, who attended the outpatient department of the Mental Hospital, Bangalore, from January 1957 to January 1961. The average maternal age at the time of the birth of the mongoloid child was 34 in contrast to 24 in the control group. Average age difference between the mongoloid and the immediately elder child was 7 years; it was 4 years in the control group. Main biochemical abnormalities noted were: decrease in serum calcium with slight increase in serum phosphorus; decrease in the serum albumin fraction and an increase in all fractions of globulin, more in the gamma globulin fraction; and decrease in the urinary excretion of 17-ketosteroids.—*J. DiGiovanni.*

5423. Wallin, J. E. W. (Lyndalia, Del.) New frontiers in the social perspective of the mentally retarded. *Train. Sch. Bull.*, 1962, 59(3), 89-104.—Society's changing attitudes toward the mentally deficient are described together with a review of changing practices and procedures in the treatment and care of them.—*V. S. Sexton.*

5424. Wolfensberger, W. (Maudsley Hosp., London, England) Age variations in Vineland SQ scores for the four levels of adaptive behavior of the 1959 AAMD behavioral classification. *Amer. J. ment. Defic.*, 1962, 67(3), 452-454.—A table was devised presenting Vineland SQ scores for all age groups and corresponding to the 4 levels of adaptive behavior as defined by the American Association on Mental Deficiency in 1959. The SQ scores for the various levels varied by as many as 61 points between age groups. The necessity for converting scores into levels or into standard scores for comparison purposes is indicated.—*V. S. Sexton.*

5425. Wolfensberger, W. (Maudsley Hosp., London, England) The correlation between PPVT and achievement scores among retardates: A further study. *Amer. J. ment. Defic.*, 1962, 67(3), 450-451.—Contrary to research conducted by D. L. Kimbrell (1960), the Peabody Picture Vocabulary Test

was found to correlate significantly with achievement in a retarded group. Possible reasons for Kimbrell's findings are adduced.—*V. S. Sexton.*

5426. Zeaman, David, & House, Betty J. (U. Connecticut) **Mongoloid MA is proportional to logCA.** *Child Developm.*, 1962, 33(3), 481-488.—Changes in MA and IQ of a group of institutionalized mongoloid retardates were related to CA by cross-sectional and semilongitudinal methods. IQ declined a few points a year when the children were young and gradually stabilized as they became adults. MA was proportional to logCA. It was suggested that the ratio MA/logCA might be a useful measure of relative intelligence of mongoloids because of its constancy.—*Author abstract.*

BEHAVIOR PROBLEMS

5427. Grimm, Elaine. (Dept. Obstet., New York Hosp.) **Psychological investigation of habitual abortion.** *Psychosom. Med.*, 1962, 24(4), 369-378.—"A set of personality characteristics, as reflected on the Wechsler-Bellevue, Rorschach, and TAT, was found to discriminate significantly between (1) 70 habitual aborters and 35 non-aborters, (2) habitual aborters with and without a known organic basis, and (3) habitual aborters before and after psychotherapy." They were more emotionally labile and socially conforming, holding in their angry reactions to frustrations. (26 ref.)—*W. G. Shipman.*

5428. Nylander, Ingvar. "Thinner" addiction in children and adolescents. *Acta paedopsychiat.*, Basel, 1962, 29(9), 273-283.—The use of paint thinner among children has been epidemic in Stockholm for about 10 years. The psychopathological phenomena are in some cases similar to those of alcohol abuse. It is not certain whether this abuse leads to permanent somatic damage. There is evidence that the liver and haemopoietic system can be damaged.—*G. Rubin-Rabson.*

Alcoholism

5429. de Saugy, Daisy. (Policlinique Universitaire de Psychiatrie, Genève, Switzerland) **L'alcoolique et sa femme: Étude psychosociale et statistique sur les conditions de leur développement individuel et de leur vie en commune.** [The alcoholic and his wife: A psychosocial and statistical study of the conditions of their individual development and of their life together.] *Hyg. ment.*, 1962, 51(3), 81-128.—The wife of the male alcoholic frequently manifests important neurotic traits. There is no single type, but the traits most commonly mentioned in the literature are dependence, frigidity, sado-masochistic tendencies, the need to find fault, and a hesitant and fluctuating attitude. The cure of the husband's alcoholism often produces a disruption in the wife which takes the form of regressive or anxiety states, even psychosis. Statistical evaluations are presented of various factors in the alcoholic's family background and marital adjustment.—*W. W. Meissner.*

5430. Shaffer, John W., Hanlon, Thomas E., Wolf, Sidney; Foxwell, Nancy H., & Kurland, Albert A. (Spring Grove State Hosp., Baltimore, Md.) **Nialamide in the treatment of alcoholism.** *J. nerv. ment. Dis.*, 1962, 135(3), 222-232.—"In a

double-blind study of the effectiveness of nialamide in the treatment of hospitalized convalescing alcoholics, patients were randomly assigned to two groups, one of which received 200 mg. of nialamide daily and the other, an inert placebo. Patients were evaluated both before and after treatment on over 50 criterion measures including clinical ratings, blood and liver function studies, electroencephalograms and objective psychological tests. With regard to means, differences between the two groups following treatment were not significant. There was some evidence, however, that nialamide may produce individual difference in response along one or more dimensions."—*N. H. Pronko.*

5431. Smart, Reginald G. (Alcoholism & Drug Addiction Research Foundation, Toronto) **Alcoholism, birth order, and family size.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 17-23.—On the basis of Schachter's findings relating affiliation during anxiety to birth order it was predicted that later borns and persons from large families should be overrepresented among alcoholics and that the number of alcoholics within each family size should increase with increasing birth order. First borns were expected to have significantly more therapeutic contacts than later borns. It was pointed out that Schachter's analyses, based on Bakan's data, lacked, among other things, a correction for family size. When this correction was employed with birth order and family size data from a sample of 242 treated alcoholics, the only hypothesis supported was that relating to an overrepresentation of persons from large families.—*Journal abstract.*

Sex Deviation

5432. Bychowski, Gustav. **Das Ich und das Objekt des Homosexuellen.** [The ego and the object of the homosexual.] *Psyche, Stuttgart*, 1961, 15(7), 465-474.—Homosexual activity may be regarded as a form of sudden drive discharge based on a release of internal images. The homosexual ego is usually capable of rapidly changing role positions in its discharge of fixated early drive formations. There is 1 constant feature of all possible homosexual combinations and constellations: projection of the self-image onto the homosexual object. This is a German translation of the original English version (see *Int. J. Psycho-Anal.*, 1961, 42, 255-259).—*E. W. Eng.*

5433. Cabeen, Charles W., & Coleman, James C. (Metropolitan State Hosp., Norwalk, Calif.) **The selection of sex-offender patients for group psychotherapy.** *Int. J. group Psychother.*, 1962, 12(3), 326-334.—An attempt was made to evaluate 5 factors commonly assumed to be of importance in the selection of sex-offender patients for group psychotherapy: age, intelligence, diagnosis, type of sex offense, and number of arrests. Only "diagnosis" showed a significant relationship to the outcome of therapy; patients diagnosed as neurotics tended to show improvement more often than those diagnosed as psychopathic personality.—*L. N. Solomon.*

5434. Caprio, Frank S. **Female homosexuality: A psychodynamic study of Lesbianism.** New York: Grove, 1962. x, 334 p. \$.75 (paper).—A paperback edition of a book originally published in 1954.—*C. T. Morgan.*

5435. Fitch, J. H. (H. M. Prison, Bristol, England) **Men convicted of sexual offences against children: A descriptive follow-up study.** *Brit. J. Criminol.*, 1962, 3(1), 18-37.—139 men were used in this investigation. 77 of these men were convicted of heterosexual offenses, and 62 were convicted of homosexual offenses. The aim of the investigation was to find what objective differences existed between these 2 groups, and what differences existed between those subsequently convicted of further sexual offenses and those not so reconvicted. It was found that: (a) there was no significant difference between the homosexual and heterosexual offenders in respect to age at time of offense, age at first conviction for sexual offense, and intelligence; (b) there were major differences in respect to employment level, marital status, sentence decreed, and pattern of previous and subsequent convictions; (c) sexual recidivists were predominantly homosexual offenders, single men, and had a history of previous convictions for sexual offenses. Psychologically, sexual offenders were tentatively classified as "Immature," "Frustrated," "Sociopathic," "Pathological," and "Miscellaneous."—*M. P. Argyropoulos.*

5436. Hooker, E. (U. California, Los Angeles) **The homosexual community.** In G. Nielson, *Proceedings of the XIV International Congress of Applied Psychology. Vol. 2. Personality research* (see 37: 4117). Pp. 40-59.—Features of a homosexual community in a large urban setting are described.—*B. T. Jensen.*

5437. Karon, B. P., & Rosberg, J. (Princeton U.) **The homosexual urges in schizophrenia.** *Psychoanal. psychoanal. Rev.*, 1958, 45(4), 50-56.—In our experience, edipal interpretations of the homosexual urges produce no noticeable change in schizophrenic patients. The deepest root of the homosexual urges in such patients is the wish for a resolution of the original mother-child relationship through the fantasy of becoming one's own mother, through the fantasy that one's sexual identity accounts for the mother's rejection, through the fantasy of finding a same-sexed substitute mother, and in male patients, the penis-breast equation and the fantasy of draining which may lead to a castration wish underlying castration fear. When these factors are not taken into account, the homosexual urges block the progress of the therapy; when these factors are dealt with, the homosexual urges are no more of a therapeutic problem than any of the other symptoms of schizophrenia.—*Author abstract.*

5438. Rhinehart, J. W. **Genesis of overt incest.** *Comprehen. Psychiat.*, 1961, 2(6), 338-349.—Incidence of overt incest is less than one per million in English-speaking countries. Father-daughter or father-stepdaughter is most common and mother-son is least common. Some feel the incest taboo is needed to control the adults rather than the children. 4 cases of overt incest are described to illustrate its determination by the interlocking psychodynamics of the participants with a past and present setting of interaction in multiple generations, socioeconomic status, broader cultural conflict, and overall immature personality make-up.—*D. Prager.*

5439. Stekel, Wilhelm. **Auto-eroticism: A psychiatric study of onanism and neurosis.** New York: Grove, 1961. vii, 289 p. \$2.95(paper).—A

paperback edition of a book first published in 1950.—*C. T. Morgan.*

Drug Addiction

Suicide (& Homicide)

5440. Bruhn, John G. (U. Edinburgh, Scotland) **Broken homes among attempted suicides and psychiatric out-patients: A comparative study.** *J. ment. Sci.*, 1962, 108(Whole No. 457), 772-779.—Absence or loss of one or both parents by death or by separation due to marital disharmony characterized 42% of a group of 91 attempted suicides. Unemployment of the breadwinner, residential mobility, and marital disharmony were typical among attempted suicides from broken homes.—*W. L. Wilkins.*

5441. Farberow, Norman L., & Shneidman, Edwin S. (Eds.) (Suicide Prevention Cent., Los Angeles, Calif.) **The cry for help.** New York: McGraw-Hill, 1961. xvi, 398 p. \$9.95.—Farberow, Shneidman, Robert E. Litman, Norman D. Tabachnick, Calista V. Leonard, and Theodore J. Curphey discuss "The Suicide Prevention Center," "Statistical Comparisons Between Attempted and Committed Suicides," "Emergency Evaluation of Self-Destructive Potentiality," "The Assessment of Self-Destructive Potentiality," "Suicide Among Schizophrenic Mental Hospital Patients," various aspects of suicidal death, and "A Survey of Agencies for the Prevention of Suicide." The case history of a 23-year-old, white, Methodist, single college student is presented and discussed from various points of view: psychoanalytic (S. Furtman & H. Hendin), Jungian (B. Klopfer), Adlerian (L. Ansbacher), Sullivanian (M. R. Green), Horney (L. E. De Rosis), personal construct (G. A. Kelly), and Rogerian (S. Diamond). Each presents the theoretical framework and therapeutic implications. (Psychological, sociological, medico-legal, and religious-philosophical bibliographies: 1897-1957)—*L. W. Brandt.*

5442. Hankoff, L. D. **An epidemic of attempted suicide.** *Comprehen. Psychiat.*, 1961, 2(5), 294-298. A higher rate of attempted suicides was observed for 2 of 12 mo. of observation of an isolated command of United States Marine Corps troops. The men shared a distaste for their immediate environment and a desire to be out of it. The act of attempting suicide occurred in those previously having a potential for acting out. The cultural setting then superimposed the behavioral content on the form provided by the personality structure.—*D. Prager.*

5443. Sathyavathi, K., & Murti Rao, D. L. N. (All-India Inst. Mental Health) **A study of suicide in Bangalore.** *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 1-19.—A high rate of suicide in any country or area is taken as evidence of social disorganization. Suicide is considered the end result of certain forms of mental stresses. This study obtained all available information on successful suicides in the city of Bangalore and compared these data with those of other countries. In Western countries, male suicides are 3-4 times that of females. In India, suicide is more frequent among women under the age of 30 and more frequent among men who are over 30 years. Drowning is the most common method employed (38.2%). The reasons given for suicide are illness and economic factors.—*J. DiGiovanni.*

CRIME & DELINQUENCY

5444. Allchin, W. H. (Portman Clinic, London, England) **Some positive aspects of delinquent behavior.** *Brit. J. Criminol.*, 1962, 3(1), 38-46.—Delinquent behavior is viewed as (a) striving towards ego development, (b) endeavoring to deal with a loss of feeling of reality and identity, and (c) avoidance of an experience of weakness and dependency. Thus, overt aggression being a positive effort for communication and self-assertion can be transformed into a positive stimulus towards reform and health. Individual treatment, as well as social and political changes are suggested.—*M. P. Argyropoulos.*

5445. Bluestone, Harvey, & McGahee, Carl L. (New York) **Reaction to extreme stress: Impending death by execution.** *Amer. J. Psychiat.*, 1962, 119(5), 393-396.—18 men and 1 woman in the Sing Sing death house awaiting execution were studied for a year or 2 prior to their death. Certain common features in their backgrounds were noted as well as the use of defense mechanisms of denial, projection, and obsessive rumination with which they warded off extreme anxiety and depression that would have otherwise overwhelmed the prisoners.—*N. H. Pronko.*

5446. Craddick, R. A. (New Mexico State U.) **Draw-A-Person characteristics of psychopathic prisoners and college students.** *Percept. mot. Skills*, 1962, 15(1), 11-13.—Drawings of a man by 20 male psychopathic prisoners and 20 male college students were compared in terms of characteristic features which Machover (1949) suggested were indicative of psychopaths. None of these features differentiated between the 2 groups with the exception of shading. Here the differentiation was in an opposite direction to that suggested by Machover, since more of the students exhibited shading in their drawings than did the psychopaths.—*W. H. Guertin.*

5447. Dinitz, S., Scarpitti, F. R., & Reckless, W. C. **Delinquency vulnerability: A cross group and longitudinal analysis.** *Amer. sociol. Rev.*, 1962, 27(4), 515-517.—Comparison is made between a group of 70 white boys, currently 16 years old, who had been part of a cohort of 101 12-year-olds nominated by their teachers as headed for trouble with the law, and 103 same-aged boys out of an original cohort of 125 boys nominated by their teachers as likely to stay out of trouble with the law. The former "bad" or "vulnerable" boys at 16 had had more frequent contact with the court in the preceding 4 years, scored higher on a delinquency checklist measuring frequency of delinquent acts, and higher on the California Personality Inventory De scale assessing degree of poor socialization. The De scale scores at 16 correlated +.78 with the scores obtained 4 years earlier in the vulnerable sample, but only +.15 in the "good boy" sample. The vulnerable boys also had more friends who had been in trouble with the law.—*L. Berkowitz.*

5448. Epstein, Norman, & Slavson, S. R. (Children's Village, Dobbs Ferry, N. Y.) **"Break-through" in group treatment of hardened delinquent adolescent boys.** *Int. J. group Psychother.*, 1962, 12(2), 199-210.—A procedure for reaching fairly hardened, delinquent adolescent boys in a residential treatment program through a modified form

of analytic group psychotherapy is presented, focusing specifically upon the reversal from projection of blame upon the environment to self-understanding and self-confrontation.—*L. N. Solomon.*

5449. Fitch, J. H. (H. M. Prison, Bristol, England) **Two personality variables and their distribution in a criminal population: An empirical study.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 161-167.—From studies of several hundreds of prisoners it was shown that performance on the E scale of the Maudsley Personality Inventory is related to age and, on the N scale, to the felt-anxiety of the reward situation. Although neuroticism and recidivism were found to be related, there was no direct evidence one way or the other with respect to Franks' theory of introversion-extraversion and recidivism. Sexual offenses tended to be committed more by introverts than by extraverts. Significant associations were also found between high E scores and variables suggestive of an early failure in socialization and between high N scores and reported childhood unhappiness or a family history of mental disorder.—*C. M. Franks.*

5450. Gueneau, Monique. **Masochisme et culpabilité chez le jeune délinquant.** [Masochism and guilt in the juvenile delinquent.] *Psychol. Franc.*, 1962, 7(2), 94-101.—A discussion is offered of factors contributing to delinquency. The author is critical of the view that delinquency is associated largely with low intelligence and suggests that a more adequate explanation is to be found in the circular frustration-aggression pattern. Adequate treatment would require extensive re-education.—*C. J. Adkins.*

5451. Jaffee, Lester D., & Polansky, Norman A. (Hebrew U., Jerusalem, Israel) **Verbal inaccessibility in young adolescents showing delinquent trends.** *J. Hlth. hum. Behav.*, 1962, 3(2), 105-111.—The goal was to study verbal accessibility among boys with emotional disorders. 3 groups were studied: (a) low-income Negro, N=102; (b) low-income white, N=72; and (c) middle-income white, N=105. "On the basis of Gough's So scale and external criteria, a subsample of boys with the most marked evidences of delinquent trends was identified in each sample. These were then compared with a subsample of boys showing the least signs of pre-delinquency. Comparisons were made with respect to three measures of verbal accessibility: attitude toward revealing intimate feelings; actual patterns of communication as reported by the boys; and responses to a device calculated to 'pull' emotional expressions. Results uniformly supported the hypothesis that, as compared with a contrast group, boys with delinquent trends tend to be relatively verbally inaccessible."—*L. A. Ostlund.*

5452. Kollerics, F. **Versuche zu einer Lebensplan-Typologie.** [Attempts toward a typology of life-plans.] *Psychol. Rdsch.*, 1962, 13(4), 270-274.—Detention home records of 226 juvenile delinquents yielded characteristic coefficients of instability. The coefficient was useful in the identification of certain types of delinquents; e.g., aggressive, egocentric, repressed groups.—*W. J. Koppitz.*

5453. McDavid, John W., & McCandless, Boyd R. (U. Miami) **Psychological theory, research, and juvenile delinquency.** *J. crim. Law Criminol. police Sci.*, 1962, 53, 1-14.—An evaluation of the

contributions of child psychologists to the study of delinquent behavior. The distinction between asocial behavior (delinquency) and antisocial behavior (criminality) is drawn.—*J. R. Kinzer.*

5454. **McNeil, Elton B.** (U. Michigan) **Patterns of aggression.** *J. child Psychol. Psychiat.*, 1962, 3(2), 65-77.—Counselor ratings of 59 emotionally disturbed and delinquent children at a "fresh air camp" supported the impression of differing patterns of aggression with different implications. Children who initiate fights tend to swear, call names, sulk, and become aggressive in competitive games. They are not significantly accepted or rejected by peers. Children who fight to protect themselves or others tend to be led into trouble but can compete without aggression suggesting that their actions are essentially social.—*J. M. Reisman.*

5455. **Maria, G.** **Malattie mentali crimino-genetiche.** [Criminal-genetic mental disease.] *Difesa soc.*, 1962, 41(2), 113-120.—Cerebral deterioration, schizophrenia, and manic-depressive disease account for 88% of crimes with attendant psychiatric disorder.—*L. L'Abate.*

5456. **Ravenette, A. T., & Kahn, J. H.** (County Borough, West Ham, England) **Intellectual ability of disturbed children in a working-class area.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 208-212.—128 children attending a child guidance clinic in a working-class area were given the WISC as part of their clinical examination. The verbal ability of older boys was found to be significantly lower than their performance ability. The variability of subtest scores was significantly less than that obtained in a similar middle-class population. These results are related to previous work relating such data to personality structure, cultural, and class differences.—*C. M. Franks.*

5457. **Robison, Sophia M.** **Juvenile delinquency: Its nature and control.** New York: Holt, Rinehart & Winston, 1960. viii, 546 p. \$6.75.—"This text proposes to re-examine the field as it has been staked out by a variety of scientists and technologists. Part I looks critically at the processes of labeling behavior which, in the past, have assumed that delinquency is a state of being that, like a disease, can be identified and treated. Part II is concerned with the efforts to explain delinquency in terms of individual or family characteristics, the sociological concepts of ecology, role, class, the psychological and anthropological approaches in explaining behavior. Parts III and IV describe and evaluate official and unofficial agencies for dealing with delinquents in institutions or in the community. Part V outlines general proposals for preventing delinquency."—*N. De Palma.*

5458. **Siegmán, A. W.** (U. Maryland, School Medicine) **The relationship between future time perspective, time estimation, and impulse control in a group of young offenders and in a control group.** *J. consult. Psychol.*, 1961, 25(6), 470-475.—There is a positive correlation between the range of future time perspective, a time estimation task, and a motor impulse control task in delinquent Israeli boys. Motor impulse control is not related for controls, nor is there a significant difference between groups on this variable. There is no relationship between intelligence and future time perspective or impulse control.—*E. R. Oetting.*

5459. **Siegmán, A. W.** (U. Maryland School Medicine) **Personality variables associated with admitted criminal behavior.** *J. consult. Psychol.*, 1962, 26(2), 199.—An anonymously administered scale for admitted criminality, given to college students, relates negatively to the Gough Socialization scale and scales of religious belief and observance, and positively to Edwards' n Achievement. High scorers score higher on Factor II, Emotional Maladjustment of Quay and Peterson's Delinquency scale (see 34: 6326) but not on Factors I and III, Psychopathic Personality and Family Dissension. Sex is not significant.—*E. R. Oetting.*

5460. **Smith, J. O.** (San Fernando Valley State Coll., Northridge, Calif.) **Criminality and mental retardation.** *Train. Sch. Bull.*, 1962, 59(3), 74-80. Analysis of the writings on criminality and mental retardation leads the author to the following conclusions: (a) The early emphasis on intellectual subnormality as a cause of crime is over-exaggerated and misleading. (b) Those most intellectually subnormal are least involved in delinquent and criminal actions. (c) The trainable child (IQ 30-50) requires much supervision. Here retardates are guilty of misbehavior, their transgressions are usually the result of lack of supervision, lack of insight, or the result of misunderstanding. (d) Most studies indicate that the educable mentally retarded person is represented by a higher delinquency and criminal rate than would be expected by their general prevalence in society. (e) The retardate convicted of criminal action shows a history of inadequate or broken homes, little if any supervision, poor school provisions, alcoholism, more impulsive crimes, and little ability to provide for his economic needs successfully. (f) Society should be concerned with life rather than mere school planning for the mentally retarded.—*V. S. Sexton.*

5461. **Stott, D. H.** (Glasgow U., Scotland) **Delinquency and cultural stress.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 182-191.—When Glasgow boys on probation were classified according to their family culture groups, those belonging to the groups regarded as socially inadequate showed significantly more indications of behavior disturbance than those in more socially adequate groups. It was suggested that this probably reflected the greater instability and stresses of the lower-culture families rather than teacher prejudice. Possible reasons for the existence of endemic delinquency in the large group of culturally intact working class families were discussed. It was also suggested that underprivileged children are more liable to congenital impairment and thus more vulnerable to stress.—*C. M. Franks.*

5462. **Taylor, A. J. W.** **Social isolation and imprisonment.** *Psychiatry*, 1961, 24(4), 373-376.—"This paper reports an attempt, using Hebb's approach, to test the hypothesis that personality deterioration is one of the effects of imprisonment, and that it is characterized by a loss of cognitive efficiency and a generalized lowering of motivational tone. . . . [2] tests of significance confirm deterioration on Koh's Block Design Test at and above the .05 level, and one confirms deterioration on the McGill Delta Block Test above the .05 level. . . . The experimental results did not [however]—either on all tests, or on the majority of tests—support the hypothesis that de-

terioration is an effect of imprisonment."—C. T. Morgan.

5463. United States Department of Health, Education, and Welfare, Children's Bureau. Research relating to juvenile delinquents. Washington, D. C.: United States Government Printing Office, 1962. 100 p. \$.35.—"This publication represents a listing of all research projects on juvenile delinquency which have been reported to the Children's Bureau Clearinghouse for Research in Child Life since 1948."—C. T. Morgan.

5464. Wolfgang, Marvin E., Savitz, Leonard, & Johnston, Norman. (Eds.) (U. Pennsylvania) *The sociology of crime and delinquency*. New York: Wiley, 1962. xiv, 423 p. \$6.75 (cloth); \$4.45 (paper).—A selection of 51 readings from the literature. The material is grouped in the following sections: "The Meaning of Criminology," "Problems of Criminal and Delinquency Statistics," "Methods and Techniques of Analysis," "The Social Structure: Empirical Data," "Social Values and Social Structure: Theoretical Analyses," "The Family Setting," and "Selected Patterns of Criminal Activity." Brief remarks introduce each section.—L. S. Kogan.

PSYCHOSES

5465. Declich, M. *Introduzione allo studio del diabolico in psichiatria*. [Introduction to the study of the devil in psychiatry.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(5), 409-441.—On the basis of patients suffering from endogenous depressive psychoses, principal forms of demoniacal possession are presented and discussed.—L. L'Abate.

5466. Goldstone, S., & Goldfarb, J. L. (Houston State Psychiatric Inst.) *Time estimation and psychopathology*. *Percept. mot. Skills*, 1962, 15(1), 28.—Several experiments have demonstrated that schizophrenic Ss overestimate auditory durations when comparing inputs presented with a modified method of limits procedure and an arithmetic step interval. Patient groups identified shorter durations as equivalent to one second. The present study extended this investigation to other psychiatric populations and a chronically ill nonpsychiatric population and suggests that the earlier findings were specific to schizophrenia.—W. H. Guertin.

5467. Hart, Bernard. *The psychology of insanity*. Cambridge, England: Cambridge Univer. Press, 1962. xi, 127 p. \$1.25 (paper).—A paperback edition of the 5th (1957) edition of Hart's work. The 1st edition was published in 1912.—E. L. Borrowman.

5468. Lorr, M., McNair, D. M., Klett, C. J., & Lasky, J. J. (VA) *Evidence of ten psychotic syndromes*. *J. consult. Psychol.*, 1962, 26(2), 185-189.—10 psychotic syndromes are confirmed by factor analysis of 42 rating scales and 48 check list items rating a broad sample of psychotic patients. 3 2nd-order factors are isolated.—E. R. Oetting.

5469. Luby, Elliot D., Gottlieb, Jacques S., Cohen, Bertram D., Rosenbaum, Gerald, & Domino, Edward F. (Lafayette Clinic, Detroit, Mich.) *Model psychoses and schizophrenia*. *J. Psychiat.*, 1962, 119(1), 61-64.—A series of studies was carried out employing sensory isolation, drugs,

and sleep deprivation in control Ss and chronic schizophrenic patients in an attempt to isolate the essential feature of the schizophrenic process in terms of input, output, and central functions. The latter appears to be implicated in the model psychoses and schizophrenia.—N. H. Pronko.

5470. Morris, P. A. (Kingsway Hosp., Derby, England) *A survey of 100 female senile admissions to a mental hospital*. *J. ment. Sci.*, 1962, 108 (Whole No. 457), 801-803.—Patients living alone tended to have more senile dementia. Many were unable to shop or cook and needed mostly some sympathetic help. Widowhood and urban relocation had a deleterious effect, as such tended to remove old ladies from their neighborhood and friends and to promote isolation and confusion in new surroundings. Physical illness is a most important part of admission to psychiatric hospital in the elderly.—W. L. Wilkins.

5471. Sarvis, Mary A., & Garcia, Blanche. *Etiological variables in autism*. *Psychiatry*, 1961, 24 (4), 307-317.—In more than 80 autistic children studied (a) "the difficulties invariably involved the particular developmental stage when the mother was the primary object to the child, so that the disturbance caused the child to adopt a basic paranoid attitude toward the mother; (b) the children manifested all degrees of disturbance from very mild to very severe, from transitory autistic reactions to chronic, intransigent autistic disease. Children seen in institutions and psychiatric hospitals usually fall into the latter category."—C. T. Morgan.

5472. Rubin, Theodore Isaac. *Jordi, Lisa and David*. New York: Ballantine, 1962. 144 p. \$.50 (paper).—This description of a psychotic child is moot testimony to the turmoil, anxiety, and distortion of the perceptual world experienced by a gravely disturbed youngster. There is no Jordi. He is a composite of all those troubled children seen by the author, a practicing psychiatrist, as he traces the struggle of years of institutional treatment to eventual discharge. Lisa and David are 2 severely disturbed adolescents who attempt to find their identity in life against the odds of early and extreme emotional deprivations.—B. H. Light.

5473. Satyavati, K., & Surya, N. C. *The chronic female psychiatric patient*. *Pratibha*, 1959, 2(2), 71-76.—Analysis of 80 chronic Indian female psychiatric patients shows that avoidable isolation of the patient from her accustomed surroundings is the dominant factor leading to chronicity in a majority of cases. Short-term solutions are suggested.—U. Pareek.

5474. Schultz, Clarence G. *Case report of an obsessional patient*. *Psychiatry*, 1961, 24(2, Suppl.), 62-73.—During therapy, the patient shifted "from an initial obsessive-compulsive reaction to a depressive position, and finally to a paranoid."—C. T. Morgan.

5475. Shulman, Bernard H. *The meaning of people to the schizophrenic and the manic-depressive*. *J. indiv. Psychol.*, 1962, 18(2), 151-156.—The 2 disorders are contrasted on the basis of Adler's "life style." "The schizophrenic has no hope of getting along with people. . . . The cyclothymic has no hope of getting along without people." The symptoms of the former push other persons away while the symptoms of the latter aim to involve others.—A. R. Howard.

5476. Strejilevich, S. Mario. (Castelli 367, Buenos Aires, Argentina) **La turbulence nocturne de vieillard psychotique.** [Nocturnal disturbance of the aged psychotic.] *Encephale*, 1962, 51(3), 238-262.—Nocturnal disturbances are frequent in older psychotics, due to an aggravation of spatio-temporal orientation at night (loss of light). Study of a group of 20 patients for 30 nights found such disturbances in 2-6 nights. The pattern of sleep in older persons is reviewed and some hypotheses are examined. Biological (Na and K retention, hypoglycemia, cardiovascular difficulties) and psychophysiological (sensory isolation, memory impairment, problems in self-identification and orientation) factors play a definite role. Suggestions are made for treatment. (34 ref.)—*W. W. Meissner*.

5477. Whitehorn, John C. **Alienation and leadership.** *Psychiatry*, 1961, 24(2, Suppl.), 1-6.—"I have developed a conviction that psychotic patients present very special disturbances in the social interactions relative to leadership, and that the psychiatrist needs a clear, workmanlike understanding of leadership, particularly leadership in the consultative and evocative style."—*C. T. Morgan*.

Schizophrenia

5478. Adams, Henry E., Noblin, Charles D., Butler, Joel R., & Timmons, Edwin O. (Louisiana State U.) **Differential effect of psychoanalytically-derived interpretations and verbal conditioning in schizophrenics.** *Psychol. Rep.*, 1962, 11(1), 195-198.—38 schizophrenics performed in a sentence-completion verbal conditioning experiment. One experimental group, reinforced with mild affirmatory words for choosing the pronoun "I" showed significant acquisition and extinction effects. A 2nd experimental group, reinforced with interpretative sentences, showed acquisition but no extinction. A control group given no reinforcements showed no practice effect. Results are compared to previous findings with nonpsychotic Ss.—*B. J. House*.

5479. Arieti, S. **Volition and value: A study based on catatonic schizophrenia.** *Comprehen. Psychiat.*, 1961, 2(2), 74-82.—Following a case report it is concluded that catatonia is predominantly a disorder of the will, that catatonics are tortured by the potential destructiveness of responsibility, that the passivity of the catatonic is a relief from such responsibility, and that the catatonic is a volcano of nonpetrified feelings rather than an ivory tower.—*D. Prager*.

5480. Bannister, D. (Bexley Hosp., Bexley, Kent, England) **The nature and measurement of schizophrenic thought disorder.** *J. ment. Sci.*, 1962, 108 (Whole No. 457), 825-842.—Normals, thought-disordered, and non-thought-disordered schizophrenics, depressives, and neurotics were compared on results on the repertory grid test, modified to be a photograph sorting task. Thought-disordered Ss could be distinguished but the additional diagnostic groups and the normals less so. While the distinction between the 2 schizophrenic groups on weakness of construct relationships and idiosyncratic deviation in construct relationships were not replicated, it is concluded that George Kelly's personal construct theory is a useful framework for understanding behavior—especially psychiatric conditions.—*W. L. Wilkins*.

5481. Beech, H. R., & Parboosingh, P. C. (Inst. Psychiatry, London, England) **An experimental investigation of disordered motor expression in a catatonic schizophrenic patient.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 222-227.—From a systematic experimental investigation of mannerisms and gesticulations in an unmarried female patient 2 main conclusions emerged: (a) the motor symptoms observed were subject to disinhibition by extraneous stimuli and (b) the lack of verbal responsiveness was related to defective verbal-motor output rather than to disordered sensory input.—*C. M. Franks*.

5482. Brody, Eugene B. **Social conflict and schizophrenic behavior in young adult Negro males.** *Psychiatry*, 1961, 24(4), 337-346.—"The preliminary study group reported here was characterized by the following: (1) essentially matriarchal families with aggressive, central mothers and passive, absent or remote fathers; (2) important relationships with slightly older or more successful male peers (including siblings and cousins), and a tendency to disruption of these relationships before the psychotic break; (3) psychoses with prominent elements of confusion and somatic concern, and a paranoid attitude but poorly organized or absent delusions; (4) a tendency to overt homosexual concern or a past history of homosexual interest or activity."—*C. T. Morgan*.

5483. Burnham, Donald L. **Identity definition and role demand in the hospital careers of schizophrenic patients.** *Psychiatry*, 1961, 24(2, Suppl.), 965-122.—A detailed presentation of 4 cases. "The schizophrenic patient's efforts to define his identity may be complicated by the demands of the role of patient within the hospital social structure."—*C. T. Morgan*.

5484. Cowden, Richard C. (VA Hosp., Pittsburgh, Pa.) **Problem-solving in schizophrenics as a function of motivation.** *Psychol. Rep.*, 1962, 10, 627-633.—Seventeen schizophrenics, 17 organics, and 17 normals, matched as to age, IQ, and reading ability were asked to solve anagrams while working under two different levels of stress and a control condition. The results indicate a significant difference between the normals and two patient groups in conceptual ability. The more difficult the task, the more obvious a deficit is shown by the patients. The schizophrenics cannot be differentiated from the organics on the basis of conceptual ability alone, although this may be due to the marked inter-individual variability shown by the schizophrenics. Stress alone has no significant influence on performance. There is a tendency for the schizophrenics to improve their performance under stress while the organics tend to show an increased deficit."—*B. J. House*.

5485. Draguns, Juris G. (Rochester State Hosp.) **Responses to cognitive and perceptual ambiguity in chronic and acute schizophrenics.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 24-30.—Responses of 25 acute and 34 chronic schizophrenics to perceptual and cognitive ambiguity were compared with those of 36 normal control Ss by means of: several "decision location" series consisting of blurred photographs presented in the order of increasing clarity; a series of pictures which could be matched, at Ss' discretion, with a number of statements allegedly made by the persons pictured; a series of pictures to be similarly matched with nationality names. The chronic Ss

compared to normals offered earlier recognition responses on the perceptual task and matched more items on the cognitive measures. The scores of the acute group, however, yielded uniformly negative results and were found to be intermediate in relation to those of the chronic and normal Ss. (31 ref.)—*Journal abstract.*

5487. Fish, Barbara; & Alpert, Murray. (New York U. School Medicine) Abnormal states of consciousness and muscle tone in infants born to schizophrenic mothers. *Amer. J. Psychiat.*, 1962, 119(5), 439-445.—15 children born to mothers diagnosed as schizophrenic and institutionalized in 2 New York State mental hospitals were observed from shortly after birth and for up to 10 to 24 months following for possible deviations. "These deviations in the state of consciousness, motility and muscle tonus as early as the first day of life, and continuing into the early months of infancy, provide additional evidence of some early disturbance of functioning of the nervous system in this population, which was genetically loaded for schizophrenia. It is postulated that these dysfunctions are related to the disturbances of motility, excitability and perception which are seen in older schizophrenic children."—N. H. Pronko.

5488. Foulds, G. A., & Dixon, Penelope. (Runwell Hosp., Wickford, Essex, England) The nature of intellectual deficit in schizophrenia: III. A longitudinal study of the sub-groups. *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 199-207.—"One hundred and eighty-six of the original 270 schizophrenics were re-tested on Progressive Matrices (1938) and the Mill Hill Vocabulary after a two year interval. Acute cases in all sub-groups showed powers of recovery, particularly catatonics. The overall conclusions were that all types of schizophrenics showed intellectual impairment—a reversible type of deficit, that this impairment was more or less completed by the time of first admission and that any further decrement was brought about by age, not by a progressive deficit and not mediated by hospitalization or related to length of illness."—C. M. Franks.

5489. Harms, Ernest. Did Johann Christian Reil describe schizophrenia in 1803? *Psychiatry*, 1961, 24(2), 183-184.—Reil saw clearly the general symptomatology and the differential typology of schizophrenia even if he was wrong in believing that the majority of types result from earlier mental illnesses.—C. T. Morgan.

5490. Havener, P. H., & Izard, C. E. (Vanderbilt U.) Unrealistic self-enhancement in paranoid schizophrenics. *J. consult Psychol.*, 1962, 26(1), 65-68.—Using the Berger Scale, the Tennessee Department of Health Self-Concept Scale, and the MMPI Lie scale, results are interpreted to indicate that paranoids show "unrealistic self-enhancement, a defense against complete loss of genuinely positive self-related affect and of satisfying interpersonal affective ties."—E. R. Oetting.

5491. Hunter, M., Schooler, C., Spohn, H. E. (VA Hosp., Brooklyn, N. Y.) The measurement of characteristic patterns of ward behavior in chronic schizophrenics. *J. consult. Psychol.*, 1962, 26(1), 69-73.—A time sample scale for objective assessment of ward behavior is developed. The Location-Activity-Inventory gives reliabilities from .78 to .91 and meaningful correlations with clinical data. Theory and applications are discussed.—E. R. Oetting.

5492. Kamano, D. K. (Galesburg State Research Hosp., Ill.) Self-satisfaction and psychological adjustment in schizophrenics. *J. consult. Psychol.*, 1961, 25(6), 492-496.—An index of self-satisfaction was obtained by the semantic differential technique from actual-self, ideal-self, and least-liked-self ratings of schizophrenic women. Ss showing high self-satisfaction show less recall of unfavorable items from a personal evaluation of themselves and have a greater discrepancy between level of performance and level of aspiration.—E. R. Oetting.

5493. Lu, Yi-chuang. Mother-child role relations in schizophrenia. *Psychiatry*, 1961, 24(2), 133-142.—A preliminary study of genesis of schizophrenia using nonschizophrenic siblings as controls.—C. T. Morgan.

5494. Lubin, A., Gieseck, C. F., & Williams, H. L. (Walter Reed Army Inst. Research) Direct measurement of cognitive deficit in schizophrenia. *J. consult. Psychol.*, 1962, 26(2), 139-143.—A comparison of the Army Classification Battery scores of schizophrenic patients with their previous enlistment resulted in: Pattern Analysis and Mechanical Aptitude deteriorate less than Reading and Vocabulary, Army Clerical Speed, and Arithmetical Reasoning. Deficit of $\frac{1}{4}$ - $\frac{1}{2}$ of a standard deviation is less than that for brain injured Ss.—E. R. Oetting.

5495. Lucas, C. J., Sainsbury, Peter, & Collins, Joyce G. (University Coll., London, England) A social and clinical study of delusions in schizophrenia. *J. ment. Sci.*, 1962, 108(Whole No. 457), 747-758.—In 405 schizophrenics, delusions with religious or supernatural content were more frequent in persons of higher social status, and more frequent among single than married persons. Grandiose delusions were more associated with higher social or educational background and with eldest as compared with youngest siblings. Sexual delusions were more common among women than among men. Paranoid delusions were more common among youngest siblings and among newcomers to the area rather than natives.—W. L. Wilkins.

5496. MacDonald, W. Scott, & Sheehan, Joseph G. (U. California, Los Angeles) Responses of schizophrenics to different incentives. *Psychol. Rep.*, 1962, 11(1), 211-217.—Food reward, individual encouragement, and social encouragement were used as incentives for a repetitive motor task and a verbal task. "The schizophrenic group (N=18) was compared with a hospitalized tubercular (N=18) and a non-hospitalized 'normal' control group (N=18), with whom they were similar in education and age. On the motor task, schizophrenics responded least to group incentives and most to the more concrete food reward. For the verbal task, individual encouragement proved most effective. These differences did not

appear in the two control groups." Results are related to hypotheses about schizophrenia.—*B. J. House.*

5497. Mednick, S. A. (U. Michiagn) **Schizophrenia: A learned thought disorder.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 4. Clinical psychology* (see 37: 4119). Pp. 167-178.—Descriptions of how a breakdown may occur and the "reactive and process dichotomy." A current research project is discussed.—*B. T. Jensen.*

5498. Meyer, Joachim-Ernst. **Brief communications: Depersonalization in adolescence.** *Psychiatry*, 1961, 24(4), 357-360.—2 cases of depersonalization syndromes occurring in adolescence and often mistaken for pseudoneurotic schizophrenia are described.—*C. T. Morgan.*

5499. Payne, R. W. (Queen's U., Kingston, Ontario) **An object classification test as a measure of overinclusive thinking in schizophrenic patients.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 213-221.—The object classification test consists of 12 small objects which can be sorted in 10 ways. It was predicted that patients suffering from overinclusive thought disorder would produce a large number of additional and unusual sortings. From a study of 120 normals and 126 neurotic or psychotic patients it was found that only acute schizophrenics produced overinclusive thinking and, of these, only $\frac{1}{2}$ gave an abnormally large number of unusual responses. Chronic schizophrenics, although no more overinclusive than non-schizophrenics, gave significantly fewer usual responses than did normals. It is therefore suggested that overinclusive thinking in schizophrenics may be a relatively good prognostic sign.—*C. M. Franks.*

5500. Rotshtein, G. A. **Ipokhondricheskaia shizofreniia.** [Hypochondriac schizophrenia.] Moscow, USSR: Institute Psychiatry MZ RSFSR, 1961. 138 p.—After a discussion of the general psychopathology of hypochondriac schizophrenia, the author discusses the following variants: "the paranoid, the senestopathic, and the depressive-paranoid." The author concludes with a discussion of the pathogenesis and therapy of hypochondriac states.—*I. D. London.*

5501. Sampson, Harold; Messinger, Sheldon L., & Towne, Robert D. **Two types of schizophrenic crises in women.** *Bull. Menninger Clin.*, 1961, 25(6), 296-306.—10 cases selected from a group of 17 hospitalized schizophrenic women provided illustrations of 2 types of crises: crises of separation in which marital life required "differentiation from the mother or from a type of dependence and symbiotic identification modeled after the earliest mother-child relationship," and crises of identification in which the mobilization of certain identifications with their mothers constituted the decisive threat to marital life. In the latter case, marriage, parenthood, or specific anniversaries mobilized dissociated identifications with a characteristic content.—*W. A. Varvel.*

5502. Sastry, M. N. C., & Kasturi, H. Y. (All-India Inst. of Mental Health) **Conceptual error, vocabulary and level of abstraction.** *Trans. All-India Inst. Ment. Hlth.*, 1961, 2, 107-114.—The nature and extent of relationship among different types of errors possible in Epstein's test were studied, and each of them was related to vocabulary level and level of abstraction as assessed by the Shipley-Hartford

test. The research was aimed at the relationship of vocabulary and abstraction to overinclusive thinking, said to be characteristic of schizophrenic illness. 4 types of scores (over-inclusion, under-inclusion, total conceptual error, and time) were obtained with the former test, and only 2 scores (vocabulary and abstraction) with the latter.—*J. DiGiovanni.*

5503. Searles, Harold F. **Sexual processes in schizophrenia.** *Psychiatry*, 1961, 24(2, Suppl.), 87-95.—Sexual factors comprise one major thread which, when carefully traced through the various phases of a patient's life, help link otherwise patternless behavior and reveal the continuity of the over-all path.—*C. T. Morgan.*

5504. Sen, N. N., & Sunderaraj, N. **Statistical studies on hospitalised mental patients: Part II.** *Pratibha*, 1959, 2(1), 112-120.—A few important variables were found in a group of 200 schizophrenics. The variables related to age, economic standard, genetic factor, personal history, history of present illness, physique, etc.—*U. Pareek.*

5505. Steffy, R. A., & Becker, W. C. (U. Illinois) **Measurement of the severity of disorder in schizophrenia by means of the Holtzman Inkblot Test.** *J. consult. Psychol.*, 1961, 25(6), 555.—Elgin Prognostic Scale ratings correlate negatively with genetic level ratings from the Holtzman Inkblot Test in hospitalized schizophrenics.—*E. R. Oetting.*

5506. Thorpe, J. G. (Banstead Hosp., Sutton, Surrey, England) **The response of chronic female schizophrenics to monetary incentives.** *Brit. J. soc. clin. Psychol.*, 1962, 1(3), 192-198.—From a controlled study of 25 chronic female schizophrenics working at a factory type task for 8 weeks it was concluded that (a) the incentives used had no apparent effect upon production, (b) the learning curve was a straight line, (c) productivity was higher in the afternoons than in the mornings.—*C. M. Franks.*

5507. Vinogradov, N. V. (Medical Inst., Vitebsk, USSR) **Ob okhranitel'nom i "zastoimom" tormozhenii u bol'nykh shizofreniei.** [Protective and "stagnant" inhibition in schizophrenic patients.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 426-431.—By means of the plethysmographic technique CR were established in 56 schizophrenics. Sound and light were used as CS and temperature as reinforcement. A slow process of extinction of the CR was found in 9 patients; this is called inert or stagnant inhibition. It occurred with patients suffering from a protracted disease.—*A. Cuk.*

5508. Wertheimer, Nancy M. (U. Colorado) **Schizophrenic sub-diagnosis and age at menarche.** *J. ment. Sci.*, 1962, 108(Whole No. 457), 786-789.—Late menarche females tend to have chronic diagnoses more frequently than early menarche females. For schizophrenics whose psychoses became manifest before age 25, puberal age was related to schizophrenic subtype.—*W. L. Wilkins.*

5509. Will, Otto Allen, Jr. **Paranoid development and the concept of self: Psychotherapeutic intervention.** *Psychiatry*, 1961, 24(2, Suppl.), 74-86.—"A condensed outline of a therapeutic procedure, attention being directed to certain aspects of regression and the attempts made to interrupt a destructive paranoid resolution of schizophrenic disorganization."—*C. T. Morgan.*

Affective Disorders

5510. Beck, A. T. A systematic investigation of depression. *Comprehen. Psychiat.*, 1961, 2(3), 163-170.—A depression inventory was developed and found to have high reliability and reasonably high correlation with clinicians' ratings of depth of depression. Masochism scores on the Focused Fantasy Test and the Masochism Inventory supported the hypothesis that depressed patients have a persistent need to suffer. More than 200 depressed and nondepressed psychiatric patients were the Ss tested.—D. Prager.

5511. Post, Felix. (Maudsley Hosp., London, England) The social orbit of psychiatric patients. *J. ment. Sci.*, 1962, 108 (Whole No. 457), 759-771.—Prevalence of psychiatric disturbance among persons emotionally significant to 40 patients with affective and neurotic illnesses was determined to be about 40%—these had psychiatric or psychosomatic symptoms concurrently with the patients' illnesses. In 5 cases it was clear that persons in the patients' entourage had been as ill as the patient or responsible for his symptoms. Significant others of certain patients seem drawn toward persons with psychiatric propensities, and it is suggested that heredity plays a minor role.—W. L. Wilkins.

5512. Rado, S. The automatic motivating system of depressive behavior. *Comprehen. Psychiat.*, 1961, 2(5), 248-260.—The system derives from the pattern of expiatory behavior taught the child by parents and others entrusted with his education. It is hypothesized that infantile depression is to be interpreted as a prolonged attack of retroflected rage. It is further assumed that the rage-retroflexing mechanism forms part of the innate brain organization of the infant. Viewed as a pathologic form of atonement for destructive fantasies toward the frustrating nipple or breast, depressive behavior may prove to be a response traceable to the suckling period. Physiologic and biochemical correlates of the emotional forces of which the atonement pattern is composed (rage, retroflected rage, fear, fear of conscience, and guilty fear) have been and are being explored.—D. Prager.

5513. Schneemann, K. Bemerkungen zum Problem der Zeitstörung in endogenen Depressionen unter Berücksichtigung der Dependenzlehre von Nicolai Hartmann. [Remarks on the problem of disturbed time sense in endogenous depressions in relation to the "dependency doctrine" of Nicolai Hartmann.] *Confin. psychiat.*, Basel, 1962, 5(1), 37-57.—The derivation of disturbances of time perspective from inhibited biological process as suggested by E. Straus, von Gebattel, and others is not upheld by comparative clinical findings. Depression can still be regarded as endogenous and of a process character, but as developing in the uppermost stratum of being, on which the lower strata, including bodily process, is dependent, according to the views of N. Hartmann.—E. W. Eng.

Physiological Correlates

5514. Lief, H. I., Dingman, J. F., & Bishop, M. P. (1430 Tulane Ave., New Orleans 12, La.) Psychoendocrinologic studies in a male with cyclic changes in sexuality. *Psychosom. Med.*, 1962, 24(4), 357-368.—Soon after therapy began for a 23-year-old man who had a cyclic alternation of feeling

and acting male and female for 11 years, the alternating phases ceased, accompanied by a striking increase of urinary 17-ketosteroids. The developmental and the endocrinological data obtained suggest an association between a derangement in the normal development of endrogenic characteristics and his homoerotic pattern. The possible psychophysiological bases for this unusual disorder are discussed.—W. G. Shipman.

PSYCHONEUROSES

5515. Adams, Lucille J. Mothers' anomic attitudes and childhood disorders. *Smith Col. Stud. soc. Wk.*, 1962, 33(1), 19-40.—Children brought for agency casework treatment were classified into neurotic or acting out categories. Mothers of the latter group measured higher in feelings of anomie as scored on Strole's Test of Anomie.—G. Elias.

5516. Hau, T. F. Zur Psychodynamik neurotischer Rententendenzen. [Psychodynamics of neurotic pension-tendencies.] *Psychol. Rdsch.*, 1962, 13(3), 208-213.—50 patients with neurotic pension-tendencies were compared with 50 unselected neurotic patients of the same hospital. The Maudsley Personality Questionnaire and depth exploration were employed in this comparison. The neurotic character structure was not significantly different in either group; however, the pension-aspiring group could be differentiated from the control group by characteristic trends of early childhood experiences and their effects on the personality.—W. J. Koppitz.

5517. Kiersch, Theodore A. (U. Illinois Health Service, Champaign) Amnesia: A clinical study of ninety-eight cases. *Amer. J. Psychiat.*, 1962, 119(1), 57-60.—The study of 98 cases of amnesia in military personnel "led to the conclusion that there were in fact four main categories of amnesia and some identifiable subcategories."—N. H. Pronko.

5518. Kohler, M. (Karl-Marx-U., Leipzig, East Germany) Das Elektrodermatogramm als Hilfsmittel zur Darstellung des Heilungsverlaufes bei Neurosen. [Electrodermatogram as an aid in assessing recovery from neuroses.] *Psychiat. Neurol. med. Psychol.*, Leipzig, 1962, 14(9), 335-342.—In 25 patients a total of 132 electrodermatogram (EDG) with 1848 individual curves were recorded, based on about 9300 measurements. Only a few illustrations from all these data are reported, which show changes in laterality and lability of the EDG in the course of psychotherapy. Treatment consisted mainly of suggestions in the fashion of "autogenic training," which were repeated to the patient by magnetic tape recordings. It is claimed that "a definite behavior of the curves proved to be the optimum effect of relaxation." The references relate the EDG to various theories on autonomic nervous activity and to Pavlov's "second signal system," but the published data do not permit independent verification.—R. Kaelbling.

PSYCHOSOMATICS

5519. Atanelishvili, E. V. O funktsional'nom sostoianii tsentral'noi nervnoi sistemy u bol'nykh iazvennoi bolezni'u zheludka i dvenadtsatiperstnoi kishki i ego izmeneniia v resul'tate lecheniia v usloviakh sanatoriia "Likani." [On the functional state of the central nervous system in patients with ulcers of the stomach and duodenum and its change

as a result of treatment under the conditions in the sanatorium "Likani." *Soobshch. Akad. Nauk Gruz. SSR*, 1962, 29(1), 95-100.—A study of motor reactions to visual and auditory stimuli in 142 Ss with gastric and duodenal ulcers leads to the conclusion that in such cases there exist "low lability of the basic nervous processes, weakness in the stimulatory process with simultaneous weakness of internal inhibition and speedy fatigue of the cortical cells."—*I. D. London.*

5520. **Bahnon, Claus Bahne, & Wardell, Walter I.** (U. Connecticut) **Parent constellation and psychosexual identification in male patients with myocardial infarction.** *Psychol. Rep.*, 1962, 10, 831-852. (Monogr. Suppl. 3-V10).—"All first myocardial infarctions occurring in white males, aged 35 to 64, residing in Middlesex County, Connecticut, were studied by means of a questionnaire interview. . . . A comparison group, studied in exactly the same way, included white males of the same age group, free from coronary disease who had been hospitalized during the same time interval for another severe illness of recent onset." Data are interpreted as showing that most coronary patients have feminine identification which leads to stress and conflict. A minority was regarded as father oriented but "both subgroups . . . had failed to establish their own identities in a satisfactory manner. The discussion endeavors to relate hypothetically these conflicts of identification to myocardial infarction."—*B. J. House.*

5521. **Castelnuovo-Tedesco, P.** (Harbor General Hosp., Torrance, Calif.) **Emotional antecedents of performance of ulcers of the stomach and duodenum.** *Psychosom. Med.*, 1962, 24(4), 398-416.—20 ulcer patients were studied psychiatrically. It was concluded that, generally, emotional factors were intimately involved. However, the importance of diet, alcohol, activity, and other concurrent disease also was noted. Particularly where no other serious disease coexists, perforation should be taken as presumptive evidence that the patient has tried unsuccessfully to resolve an emotional crisis. The authors suggest appropriate psychiatric help as part of the total treatment. (133 ref.)—*W. G. Shipman.*

5522. **Dauids, Anthony, & DeVault, Spencer.** (Emma Pendleton Bradley Hosp., Riverside, R. I.) **Maternal anxiety during pregnancy and childbirth abnormalities.** *Psychosom. Med.*, 1962, 24(5), 464-470.—50 clinic patients in the 3rd trimester of pregnancy were administered the Wechsler-Bellevue, MA Scale, Sentence Completion, and TAT. Both patient and examiner also rated her anxiety. Following childbirth the women were classified by experienced obstetricians as to childbirth abnormalities, yielding 2 subgroups of 25 cases. The women who were to experience complications were markedly more anxious on almost all the scales.—*W. G. Shipman.*

5523. **Delay, Jean, Brion, S., & Escourolle, R.** **Panhypopituitarisme et troubles mentaux.** [Panhypopituitarism and mental illness.] *Encephale*, 1962, 51(2), 109-131.—Previous experience with psychiatric symptoms accompanying panhypopituitarism are reviewed, and clinical and anatomical evidence from 2 new cases is presented. Panhypopituitarism, whether postpuerperal or of some other origin, is frequently and often quickly followed by psychic disturbances of mental confusion with a pre-

dominance of hallucinatory forms. Similar symptoms are observed in connection with myxedema and Addison's disease. The problem of the nature of the connection between the endocrinopathy and the psychopathology is raised and discussed. (37 ref.)—*W. W. Meissner.*

5524. **Erfmann, Irmgard.** **Age and manifestation of psychosomatic disorders.** *Vita hum.*, Basel, 1962, 5, 161-166.—An analysis of 1019 German patients with psychosomatic disorders showed that in 84% of the cases the 1st manifestation of disease occurred before the age of 40, with more than 50% reporting the 1st symptom between the ages of 15 and 30. There was a slight tendency for women to show the 1st manifestation at an earlier age than men. The more frequent psychological factors involved in the 1st signs of illness were conflicts in professional or occupational areas, social relationships, emotional problems, or war stress. It is hypothesized that conflict situations are reacted to by somatization before the age of 40 whereas other means of handling conflicts are employed by older people.—*J. L. Yager.*

5525. **Gilberstadt, Harold.** (VA Hosp., Minneapolis, Minn.) **A modal MMPI profile type in neurodermatitis.** *Psychosom. Med.*, 1962, 24(5), 471-476.—The MMPI profiles of 20 neurodermatitis and 39 nonfunctional skin cases were compared. Modal profile for the neurodermatitis sample was a low profile with highest elevations on Hs and Hy. A high Pd score was often present. The author concluded that there are several character types found within this disorder.—*W. G. Shipman.*

5526. **Gonda, Thomas A.** (Inst. Experimental Psychology, Oxford U.) **The relation between complaints of persistent pain and family size.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(3), 277-281. "A study of a representative neurological outpatient population of 123 in a number of dimensions reveals a relationship between family size and complaint of pain. Specifically, those patients who persistently complain of pain tend to have significantly more siblings than those who do not complain of pain to their doctors."—*M. L. Simmel.*

5527. **Graham, D. T., Lundy, R. M., Benjamin, Lorna S., Kabler, J. D., Lewis, W. C., Kunish, Nancy O., & Graham, Frances K.** (U. Wisconsin Medical School, Madison) **Specific attitudes in initial interviews with patients having different psychosomatic disorders.** *Psychosom. Med.*, 1962, 24(3), 257-266.—2 interview studies with hospitalized patients investigated whether attitudes predicted to be associated with diseases were more applicable to patients having the disease in question than to patients who had another disease. The percentage of predicted choices was significantly greater than the expected percentage in both studies and in both the blind and the nonblind interviews, and when naive interviewers and judges were employed.—*W. G. Shipman.*

5528. **Heinzelmann, Fred.** (US Public Health Service) **Factors in prophylaxis behavior in treating rheumatic fever: An exploratory study.** *J. Hlth. hum. Behav.*, 1962, 3(2), 73-81.—Interviews were held with 284 college students who had a history of rheumatic fever and/or rheumatic heart disease. The goal was to discover factors which differentiate persons who maintain prophylaxis from those who do

not. "Four general categories were considered in the analysis of the data: psychological factors, medical factors, sociological factors, and factors relative to the contact between the individual and physicians." Conclusion: "it is a person's subjective definition of his health situation as reflected in these beliefs rather than objective fact which is of primary importance in influencing his behavior. Any efforts which are made to promote the acceptance of prophylaxis must, therefore, be focused upon the frame of reference of the individual who has a history of rheumatic fever."—*L. A. Ostlund.*

5529. Kahana, R. J. (9 Elba St., Brookline, Mass.) A remission through crisis in ulcerative colitis. *Psychosom. Med.*, 1962, 24(5), 499-506.—The psychotherapy of a man with ulcerative colitis is reported in which a psychological crisis preceded remission of bowel dysfunction. This turning point featured hypnagogic hallucinations and dreams. The deeper psychological meaning of the illness and the crisis is seen as the patient's attempt to incorporate a constant, consistently gratifying maternal image.—*W. G. Shipman.*

5530. Kenyon, F. E. (Maudsley Hosp., London, England) A psychiatric survey of a random sample of out-patients attending a dermatological hospital. *J. psychosom. Res.*, 1962, 6(2), 129-135.—100 consecutive first referrals, aged 15 and up, attending a skin hospital outpatient clinic were administered the Maudsley Personality Inventory (MPI) and a medical questionnaire. Bacterial and fungus infection cases had the highest neuroticism and the lowest extraversion scores. Virus wart cases were both highly neurotic and extraverted. When the MPI was checked against many history and symptom variables the only significant finding was that high neuroticism scores characterized people who previously had a nervous breakdown, thought nerves were important to their disease, or who had other symptoms.—*W. G. Shipman.*

5531. Kissen, D., & Eysenck, H. J. (U. Glasgow, Scotland) Personality in male lung cancer patients. *J. psychosom. Res.*, 1962, 6(2), 123-127.—Administration of the Maudsley Personality Inventory to 239 males attending outpatient chest clinics indicated that lung cancer patients are "somewhat extraverted and markedly lower in neuroticism compared with non-cancer controls, and that there may be interaction effects with a history of other psychosomatic disorders."—*W. G. Shipman.*

5532. Lynn, David L., Glaser, Helen H., & Harrison, Grace S. (U. Colorado Medical Center) Comprehensive medical care for handicapped children: III. Concepts of illness in children with rheumatic fever. *Amer. J. Dis. Children*, 1962, 103(2), 120-128.—Doll play and interviews were used to compare 25 children with rheumatic fever and 25 nonrheumatics. Both groups shared a frequently held concept that illness was self-caused, but "children with rheumatic fever, more than nonrheumatics, associated illness with pain, physical restrictions, social handicap, heart disease, crippling, and death. The physician, in handling the patient's feelings through an understanding indirect approach, may expect to profit in management of children with rheumatic fever."—*A. B. Warren.*

5533. Markwell, E. D., Jr. (U. Arkansas Medical Cent.) Autonomic nervous system measures and factor correlates with personality indices in a tuberculous population. *J. consult. Psychol.*, 1962, 26(2), 194.—Only a few correlations between 19 physiological measures of autonomic nervous system function and MMPI scores are significant. Sublingual temperature is related to D. High apparent sympathetic dominance may be associated with psychopathic or character disorder. Dermographia latency and finger temperature relate to Hy and Pa. The former also relates to F.—*E. R. Oetting.*

5534. Meinhardt, K., & Robinson, H. A. (Norwalk, Calif.) Stokes-Adams syndrome precipitated by emotional stress: Report of a case. *Psychosom. Med.*, 1962, 24(4), 325-330.—Regular psychiatric interviews of a 28-year-old man with frequent Stokes-Adams episodes led the authors to conclude that there was a close connection between the S's intense unsatisfied dependency strivings and precipitation of his complete heart block. They proposed that these emotions cause intense vagal stimulation and thus precipitate the heart block.—*W. G. Shipman.*

5535. Pasamanick, Benjamin. (Ohio State U.) Prevalence and distribution of psychosomatic conditions in an urban population according to social class. *Psychosom. Med.*, 1962, 24(4), 352-356.—The findings on rates and socioeconomic distributions of some psychosomatic conditions in 2 major studies (Midtown and Baltimore) are compared. Marked disparities are described and attributed to the interview of the Midtown study. Household interviews do not agree with clinical evaluations.—*W. G. Shipman.*

5536. Schonfeld, W. A. (Columbia-Presbyterian Medical Cent., NYC) Gynecomastia in adolescence: Effect on body image and personality adaptation. *Psychosom. Med.*, 1962, 24(4), 379-389.—Psychiatric study was undertaken of 284 boys and men with varying degrees and types of enlargement of the breasts. Time of onset was very important. Most affected were those who developed publicly noticeable breasts during adolescence. Type and intensity of reaction were determined by previous personality, especially inner self acceptance and availability of compensatory assets. (20 ref.)—*W. G. Shipman.*

5537. Shrifte, Miriam L. (59 W. 12th St., NYC) Toward identification of a psychological variable in host resistance to cancer. *Psychosom. Med.*, 1962, 24(4), 390-397.—A hypothesis that "massive, unresolved, unpleasant feeling tension is related to low host resistance" was not confirmed when 15 slow and 7 fast growing cancer Ss (matched for age, sex, and socioeconomic status) were compared using the Rorschach. Restudy of the cases suggested that the fast and not the slows "tended to put more into than they took from the outside world." (32 ref.)—*W. G. Shipman.*

5538. Stein, A., Kaufman, M. R., Janowitz, H. D., Levy, M. H., Hollander, F., & Winkelstein, A. (Mt. Sinai Hosp., NYC) Changes in hydrochloric acid secretion in a patient with a gastric fistula during intensive psychotherapy. *Psychosom. Med.*, 1962, 24(5), 427-458.—For 2½ years, the gastric secretory functions of a 60-year-old woman with a small gastric fistula were observed

during psychotherapy. After 8 months of therapy the high normal level of gastric acidity dropped to a low normal level. This seemed to be due to either the recognition of her unconscious oral-aggressive drives or the depression-withdrawal reaction that followed. The problems in using this method are outlined. (27 ref.)—*W. G. Shipman.*

5539. **Weiner, H., Singer, Margaret T., & Reiser, M. F.** (Walter Reed Hosp., Washington, D. C.) Cardiovascular responses and their psychological correlates: I. A study in healthy young adults and patients with peptic ulcer and hypertension. *Psychosom. Med.*, 1962, 24(5), 477-498.—Heart rate and blood pressure responses of 45 healthy young men and of 28 male duodenal ulcer cases and 31 male essential hypertension cases were studied when they were presented TAT Cards 2, 3GF, and 4. Responses occurred to the examiner and to telling the story; but not to seeing the card nor to the content of the story. Failure to interact with the E was always associated with physiological hyporeactivity. The essential hypertension cases were remarkably unreactive. "Acute changes in response to laboratory manipulations probably represent the effects of experimentally superimposed psychological situations which modify on-going processes rather than initiating discreet changes from a stable, nondynamic baseline state." (45 ref.)—*W. G. Shipman.*

5540. **Weiss, P., & Emmerich, W.** (U. Colorado) Dependency fantasy and group conformity in ulcer patients. *J. consult. Psychol.*, 1962, 26(1), 61-64.—Primary type ulcer patients write more dependency themes on TAT cards and show greater group conformity in the Asch situation than non-psychosomatics. They are more conforming but not more dependent in fantasy than nonulcer psychosomatics. TAT and Asch conformity are not related in psychosomatic groups.—*E. R. Oetting.*

5541. **Wenger, M. A., Clemens, T. L., & Cullen, T. D.** (U. California, Los Angeles) Autonomic functions in patients with gastrointestinal and dermatological disorders. *Psychosom. Med.*, 1962, 24(3), 267-273.—Ss were 100 hospitalized males (31 peptic ulcer, 36 gastritis, 17 neurodermatitis, 16 psoriasis or urticaria). During a 15-minute rest and a 1-minute cold-pressor test they were studied via heart rate, respiration rate, palmar conductance, finger pulse volume, systolic and diastolic blood pressures, and finger, face, and axillary temperatures. At rest their sympathetic nervous system was more active than that of healthy controls. With stress the neurodermatitis and the nonulcerative gastrointestinal patients had a greater increase in heart rate and less increase in diastolic blood pressure than did the normative group.—*W. G. Shipman.*

EPIDEMIOLOGY

5542. **Caravedo, Baltazar, & Valdivia, Oscar.** (Mental Health Dept., Lima, Peru) A study on mental health of a cross-section of industrial population. *Int. J. soc. Psychiat.*, 1961, 7(4), 269-282.—The purpose of the study was to assess the physical and mental health of a group of labor leaders and managers in Peru by employing the Cornell

Medical Index. Results show an appreciable amount of mental illness in these people. It is suggested that such illness is related to the strikes and stoppages so prevalent in Peru.—*R. M. Frumkin.*

5543. **Group for the Advancement of Psychiatry, Committee on Preventive Psychiatry.** Problems of estimating changes in frequency of mental disorders. *GAP Rep.*, 1961, No. 50, 469-521.—"Eleven illustrative disorders are studied . . . and an attempt is made to clarify the methodological problems in eliminating changes. There was at least some initial evidence that changes in frequency may have occurred in these disorders. The disorders include conversion hysteria, syphilitic psychoses, arteriosclerotic psychoses, psychoses associated with pellagra, deliria with pneumonia, alcoholic psychoses, cretinism, post encephalitic encephalopathy, bromide psychosis, neurocirculatory asthenia, and psychoneuroses with diffuse anxiety as the primary manifestation. Possible factors contributing to changes in frequency are discussed."—*C. T. Morgan.*

5544. **Pasamanick, Benjamin.** (Ohio State U.) A survey of mental disease in an urban population: VII. An approach to total prevalence by race. *Amer. J. Psychiat.*, 1962, 119(4), 299-305.—"This paper reported the results of a series of concurrent investigations in Baltimore dealing with the prevalence rates for various psychiatric disorders in the white and nonwhite population. The findings based on a community survey, and state, private and V.A. hospital rates indicate that the white population has the higher rates for the psychoses, psychoneuroses, and the psychophysiologic-autonomic-visceral disorders. Nonwhite rates are higher for the acute brain syndromes and for mental deficiency. An attempt is made to explain these variations and to refute the conclusions of a previous study by Wilson and Lantz in Virginia."—*N. H. Pronko.*

5545. **Sen, M. N., & Sunderaraj, N.** Statistical studies on hospitalized mental patients. *Pratibha*, 1959, 2(2), 51-64.—The incidence rates of mental symptoms of a selected group of 200 schizophrenics were analysed according to age and sex. Influence of age and sex on symptom-pattern was revealed. "The incidence rates of each mental symptom in different age and age-sex groups were subjected to chi-square analyses, and the significance of differences of their occurrence was established. These symptoms were: (a) anxiety, depression, paranoid ideas and apathy; (b) attention (not sustained), preoccupied, delusions of persecution, anxiety, depressions, suspicion, apathy and orientation."—*U. Pareek.*

5546. **Whittier, J. R., & Korenyi, C.** Selected characteristics of aged patients: A study of mental hospital admissions. *Comprehen. Psychiat.*, 1961, 2(2), 113-120.—"From a study of 540 male patients aged 60 and over admitted to a state mental hospital for the first time, it was concluded that the population was characterized by high incidence of individuals in pedigree with history of mental hospitalization (8%), neurological abnormality (27%), early mortality (50%), chronic alcoholism (20%), memory, judgment, orientation defects (83%), and depression (38%)."—*D. Prager.*

EDUCATIONAL PSYCHOLOGY

5547. Alpert, R. (Harvard) **Modifying personality in a school setting.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 124-138.—Ecological studies have shown how behavior is affected by the setting. School settings should be such that defined roles emerge. A program of education is suggested.—*B. T. Jensen.*
5548. Astin, Alexander W. (National Merit Scholarship Corp., Evanston, Ill.) **An empirical characterization of higher educational institutions.** *J. educ. Psychol.*, 1962, 53(5), 224-235.—A factor analysis of 33 major attributes of colleges was performed using a sample of 335 institutions. These attributes included traditional "type" characteristics (e.g., Religious vs. Nondenominational), financial resources, measures of faculty and student characteristics, and measures of college "environment." The 6 principal dimensions along which institutions appear to differ were identified as: Affluence (wealth), Size, Private (vs. Public), Masculinity (vs. Femininity), Realistic (Technical) Emphasis, and Homogeneity. Affluence, which accounted for the largest proportion of variance, had high loadings from measures of the college's financial resources, student quality, faculty quality, and certain environmental characteristics.—*Journal abstract.*
5549. Blair, Glenn M., Jones, R. Stewart, & Simpson, Ray H. (U. Illinois) **Educational psychology.** (2nd ed.) New York: Macmillan, 1962. xxiv, 678 p. \$7.00.—Continuing the aim and strength of the 1st edition, this revision represents an unusually complete, comprehensive, and functional treatment of educational psychology. In keeping with the tremendous growth of interest in education and the need for expert teaching and efficient teaching, this text has been written to supply the teaching profession with those facts, principles, and methods of procedure which have maximal usefulness in the classroom. The psychological laboratory, classroom, and clinical experience have all contributed to the material. The plan of the book presents the child as he progresses toward maturity, then shows the forces which influence changes in the child's learning and adjustment; it illustrates how the methods and tools of psychology can be used to evaluate and improve the effectiveness of the educational program, and finally, it discusses the psychological factors which influence the professional growth and mental health of the teacher. A deliberate effort has also been made to incorporate recent psychological research and theory illustrating these with actual classroom situations. Student activities and text related films close each chapter.—*P. D. Leedy.*
5550. Cook, Stuart. (Ed.) **Research plans formulated at the Research Planning Workshop on Religious and Character Education.** New York: Religious Education Association, 1961. viii, 310 p.—"For twelve days in August 1961, fifty-seven social scientists and religious educators worked together at Cornell University to develop plans for research they hoped to carry out in the near future." 50 research designs are presented under 10 general content areas. These include values, child rearing practices, personal philosophy, religious vocations, outcomes of programs of religious education, and willed decisions.—*W. A. Koppe.*
5551. Cotsonas, Nicholas J., Jr., & Kaiser, Henry F. (U. Illinois) **A factor analysis of students' and administrators' ratings of clinical teachers in a medical school.** *J. educ. Psychol.*, 1962, 53(5), 219-223.—This analysis of ratings of 21 clinical teachers of medicine by administrators and students revealed 3 major factors: (a) the teacher's attitude towards patients and students, (b) the instructor's use of various teaching techniques, and (c) a factor estimating a teacher's knowledge. Only the 1st 2 factors influenced student rankings, although an appreciation of the 3rd is indicated. The administrators, however, were influenced only by the 3rd. The present results resemble those of previous efforts to analyze conceptions of teacher effectiveness through factor analyses of ratings (see 35: 2808). To this extent, the concepts of affective and cognitive merit—coordinate with the affective and cognitive domains of the *Taxonomy of Educational Objectives* (Bloom, 1956)—are given added support.—*Journal abstract.*
5552. Cronbach, L. J. (U. Illinois) **Psychological issues pertinent to recent American curriculum reforms.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 139-152.—After discussing some of the new approaches as related to some psychological theory, the author says that his "message has been that psychological knowledge is inadequate to answer the questions now being posed by educational leaders. Part of the fault has been our over-confidence. We have failed to realize that traditional experimental designs made it impossible . . . to ask vital questions."—*B. T. Jensen.*
5553. Godin, André. (International Center Lumen Vitae, Brussels, Belgium) **Importance and difficulty of scientific research in religious education: The problem of the "criterion."** *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 166-174.—An analysis of the difficulties encountered in the scientific study of religious growth by reason of inadequate criteria of evaluating such growth.—*S. A. Walters.*
5554. Hudson, W. **Pictorial perception and educational adaptation in Africa.** *Psychol. Afr.*, 1962, 9, 226-239.—The need for research into cross-cultural educational problems is discussed. The construction of a pictorial perceptual test is described. A comparison of the performance of white and Negro children on the test reveals that the Negro child is handicapped because he is culturally deprived. It is concluded that the existing educational system will need to be modified and adapted to benefit Negro children.—*J. L. Walker.*
5555. McConnell, T. R. **Conference summary.** In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 111-116.—In summarizing a symposium on college personality factors, 2 main themes emerge: (a) the outcomes of college education should be redefined and (b) education is not only intellectual, but a full development of the person fully. Bureaus of institutional research are of fundamental importance.—*R. Tyson.*

5556. Page, Ellis Batten. (U. Connecticut) Behavioral theory, verbal magic, and education. *Educ. Theory*, 1962, 12(2), 73-78.—The role of behavioral theory in education is examined, with particular attention to the problem of punishment as studied in psychological laboratories and applied in school settings. Inappropriate generalizations are seen to result from verbal magic, the identification of conditions, and principles with the words describing these.—*Author abstract*.

5557. Parkes, J. Carter. Impact of an experimental curriculum upon students at Austin College. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 136-142.—An introduction is supplied for Austin College's evaluation of its curriculum. The program consists of analysis of its impact on faculty and students as well as assessment of changes on the part of individual students.—*R. Tyson*.

SCHOOL LEARNING

5558. Bogojawlensky, D. N. Nauczanie sposobów pracy umysłowej jako metoda rozwijania myślenia uczniów i aktywizacji uczenia się. [Teaching effective study methods as a way of developing pupils' thinking and of activating their learning.] *Psychol. Wych.*, 1962, 5(2), 133-143.—Proper study techniques rather than problem solving situations or motivation are key factors in enhancing self-learning. An outline of study techniques is presented.—*H. Kaczkowski*.

5559. Conde, Le Roy. An experiment in second-language instruction of beginning Indian children. *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1962, No. 1, 8-11.—7 teachers of Indian pupils in 4 New Mexico public schools were involved in a series of enrichment methods: tape recorders, pictures, games, etc. Most of these teachers obtained higher pupil gains than they had during the preceding year, thus validating the notion of involving teachers in in-service programs.—*J. G. Cooper*.

5560. Christensen, C. M. (U. Alberta) A note on "Dogmatism and Learning." *J. abnorm. soc. Psychol.*, 1963, 66(1), 75-76.—In a study of dogmatism and learning with a sample of 166 students in an introductory psychology course, no confirmation was found of Ehrlich's findings (see 36: 3KB48E) that the Dogmatism Scale predicts classroom learning. There was positive support, however, for previous findings for the independence of aptitude and dogmatism.—*Journal abstract*.

5561. de Ajuriaguerra, J., & Auzias, H. Methodes et techniques d'apprentissage de l'écriture [Methods and techniques of learning to write.] *Psychiat. Enfant*, 1960, 3(2), 609-718.—Writing difficulties (dysgraphia) often represent a major problem. In order to understand the nature and extent of the dysgraphia, it is necessary to have a knowledge of the methods used in teaching writing. An analysis of these methods, a review of the literature, and the findings of a questionnaire are presented. The methods are evaluated in terms of (a) the comparative value of the technique used and (b) what writing means to the child according to his age and psychomotor abilities. The problems of the lefthanded child are dealt with in some detail.—*R. Naar*.

5562. Hendrickson, Lois N., & Muehl, Siegm. (Iowa Child Welfare Research Station) The effect of attention and motor response pretraining on learning to discriminate B and D in kindergarten children. *J. educ. Psychol.*, 1962, 53(5), 236-241.—This study compared 3 groups of kindergarten children (49 Ss in all) in learning names for the letters "b" and "d." An Attention-Consistent Motor (A-CM) group received pretraining in attending to the directional difference between the letters and making consistent motor responses to each letter. An Attention-Inconsistent Motor (A-IM) group received similar attention pretraining, but made inconsistent motor responses to each letter. An Irrelevant-Control (Ir-C) group received attention and motor response pretraining to color stimuli. Performance of the 3 groups on the letter-naming transfer task showed the 2 attention groups superior to the control group. No significant performance differences were associated with the motor response variable.—*Journal abstract*.

5563. Lewicki, A. Psychologiczna analiza czynników wyznaczających wyniki nauczania. [Psychological analysis of factors determining the results of school teaching.] *Psychol. Wych.*, 1962, 5(2), 144-167.—The principle aspects involved in effective classroom learning are divided into external and internal factors. These factors were utilized in the development of a set of "rules" to be employed by teachers to increase the rate of learning in the classroom.—*H. Kaczkowski*.

5564. Miles, Josephine. (U. California, Berkeley) The use of reason. *Teachers Coll. Rec.*, 1962, 63(7), 540-547.—"When a man reasons, he sets up a provisional expectation, then he checks it against the evidence pro and con, then he reformulates it in a form strengthened by what he had discovered or called to mind." Suggestions are given for promoting this process through the various school subjects.—*H. K. Moore*.

5565. Nakadake, Osamaro. (Osaka Prefectural Inst. Educational Research) [A methodological study concerning an analysis of the learning mechanism: III. Analysis of readiness and relevance in learning.] *Jap. J. educ. Psychol.*, 1962, 10(2), 99-106.

5566. Pressey, S. L. (Ohio State U.) Educational acceleration: Occasional procedure or major issue? *Personnel Guid. J.*, 1962, 41(1), 12-17.—Research evidence is overwhelmingly in favor of acceleration through the present school structure. More education within a given time may result together with increase in functioning abilities.—*S. Kavruck*.

5567. Sessions, Frank Q., & Carruth, Max L. (U. Utah) Student performance in morning and afternoon classes. *Personnel Guid. J.*, 1962, 41(2), 144-146.—No significant difference was found with respect to academic performance of students assigned to morning or to afternoon English classes. It is concluded that when type of instruction and course content are held constant for both mornings and afternoons, the class hour itself has no significant effect on student performance.—*S. Kavruck*.

5568. Usova, A. P. Obuchenie v detskom sadu. [Teaching in the kindergarten.] *Izv. Akad. Pedag. Nauk RSFSR*, 1961, No. 118. 132 p.—The author

reports on the results of her research on teaching in the kindergarten. She considers the role of teaching in the educational work of kindergarten and age differences in the learning of the young child.—*I. D. London.*

5569. Wall, W D., & Miller, K. M. (National Found. Educational Research, London, England) **Motivation and counter-motivation.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 3. Child and education* (see 37: 4118). Pp. 161-175.—A report of several studies of effects of parental interest, teacher attitude, anxiety, and pupil attitude on learning. (17 ref.)—*B. T. Jensen.*

INSTRUCTIONAL AIDS

5570. Coulson, John E., Estavan, Donald P., Melaragno, Ralph J., & Silberman, Harry F. (System Development Corp., Santa Monica, Calif.) **Effects of branching in a computer controlled autoinstructional device.** *J. appl. Psychol.*, 1962, 46(6), 389-392.—2 groups of 15 high school Ss received instruction in logic from a computer controlled autoinstructional device. In 1 group all Ss received a fixed sequence of 233 items. In the 2nd group each of the Ss received a different number and sequence of items, depending on the S's performance during the lesson. Branching decisions were based on errors and on the S's evaluation of his own readiness to advance to new topics. Posttest scores were significantly higher (.05 level) for the branching group than for the fixed sequence group; training time differences were not significant.—*Journal abstract.*

5571. Coulson, John E., & Silberman, Harry F. (System Development Corp., Santa Monica, Calif.) **Automated teaching and individual differences.** *Audiovis. Commun. Rev.*, 1961, 9(1), 5-15.—A summary of research on automated teaching completed and planned at System Development Corporation.—*R. E. Schutz.*

5572. Eigen, Lewis D. (Cent. Programed Instruction) **A comparison of 3 modes of presenting a programmed instruction sequence.** *J. educ. Res.*, 1962, 55(9), 453-460.—77 8th graders with mean IQ of 118 were assigned to machine, horizontal-text, and vertical-text modes of presentation. The 65-frame program used was designed to teach differences between numbers and numerals. 2 major findings evolve. Inter-mode differences in learning are not statistically significant. Ss using the programmed texts complete the program in less time, although not significantly so, than do Ss who use the machines.—*F. Goldsmith.*

5573. Evans, James L., Homme, Lloyd E., & Glaser, Robert. (U. Pittsburgh) **The Ruleg system for the construction of programmed verbal learning sequences.** *J. educ. Res.*, 1962, 55(9), 513-518.—The authors suggest a "Ruleg system" in which material to be programmed is broken down into "rules" and "examples" in terms of the desired outcome, carefully ordered, assembled into frames, tested, and revised. In programming work the Ruleg System has been found to be a helpful prompting system and is an improvement over a more artistic manipulation of the subject matter. It also provides a way of communicating to others in an operational fashion,

one of the ways in which program construction can be carried out.—*F. Goldsmith.*

5574. Follett, Joseph F. **Effects of training response mode, test form, and measure on acquisition of semi-ordered factual materials.** *HumRRORes. Bull.*, 1961, No. 24. ix, 62 p.—Studies indicate equal effectiveness of live and taped lectures, superiority of read over heard material, self-paced over class-paced reading, and plain over scrambled-book format. Recognition tests could be substituted for recall-form tests.—*R. Tyson.*

5575. Hartman, Frank R. (Pennsylvania State U.) **Recognition learning under multiple channel presentation and testing conditions.** *Audiovis. Commun. Rev.*, 1961, 9(1), 24-43.—A comparison of the teaching effectiveness of color and monochrome television instruction. 15 different lessons were shown to matched groups of military trainees in either black-and-white or color. Analyses of results on multiple choice achievement tests taken immediately after instruction "provide no evidence that a significant difference in training effectiveness exists."—*R. E. Schutz.*

5576. Hilgard, Ernest R. **Teaching machines and learning theory.** In R. E. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of symposium* (see 37: 5621). Pp. 63-67.—Teaching machines respect differential learning rates, provide knowledge of results, keep the learner active, let the learner "prompt" instead of learn by rote. They cannot replace laboratories, discussions, libraries, and other aspects of a full program. A teacher can adjust to the "unique personality of the learner."—*R. Tyson.*

5577. Kopstein, Felix F., & Shillestad, Isabel J. **A survey of auto-instructional devices.** *USAF ASD tech. Rep.*, 1961, No. 61-414. vii, 119 p.—This report summarizes the state of the art of auto-instruction and teaching devices and catalogs instructional devices to April 1961, in the interest of suggesting possible applications to local training or educational problems. The 1st section briefly reviews what auto-instruction is, whether it is an entirely new concept, its practical benefits, auto-instruction terminology, programs and devices, current programming formats, evaluating a program, and discusses prospects for the future of auto-instruction. The 2nd section catalogs and describes all major current auto-instructional devices: Skinner machines, Pressey machines, Crowder technique, self-organizing systems, audio-visual machines, digital computers as teaching machines, and miscellaneous devices. A list of teaching machine patents is appended.—*USAF ASD.*

5578. Krumboltz, J. D., & Weisman, R. G. (Stanford U.) **The effect of intermittent confirmation in programed instruction.** *J. educ. Psychol.*, 1962, 53(6), 250-253.—The effect of intermittent confirmation was tested on 121 students by omitting various patterns of confirming answers from a programed textbook on educational measurement. The schedules included 4 levels of fixed-ratio confirmation and 2 of variable-ratio confirmation. Results based on criterion measures consisting of errors made on the program and performance on a posttest indicated: a negative linear relationship between the number of errors made on the program and the percentage of confirmation provided, no significant ef-

fects on the posttest from the various proportions of confirmation, and no evidence of differential effect between fixed-ratio and variable-ratio confirmation on either criterion.—*Journal abstract.*

5579. Lambert, Philip; Miller, Donald M., & Wiley, David E. (U. Wisconsin) **Experimental folklore and experimentation: The study of programmed learning in the Wauwatosa public schools.** *J. educ. Res.*, 1962, 55(9), 485-491.—The Ss for this experiment were 552 9th-grade pupils who worked without help through a programmed unit in mathematics. The most significant factor associated with immediate acquisition of the programmed material was intelligence. Furthermore, they found that the covert response method took significantly less time for completion without a corresponding decrease on the immediate-retention test.—*F. Goldsmith.*

5580. McCrystal, Thomas J. **Programmed instruction: A plan of research.** *HumRRO res. Bull.*, 1961, No. 25. iv, 44 p.—The concise summary deals with a 1960 program for more efficient programmed learning of verbal materials. Self-instructional methods, programs, and devices were assessed. Presumably relevant variables and suitable research apparatus are described.—*R. Tyson.*

5581. Mager, Robert F., & Whitmore, Paul G. **Results of exploratory investigations conducted for the purpose of planning a research program on instructional methods.** *HumRRO res. Memo.*, 1961, Subtask Textstruct I. iv, 40 p.—The broad problem of military instruction is examined, and its highlights are identified. Aspects considered are the technique for securing class responses during instruction, automation, specifying training objectives, programing, and the evaluation and motivation of students.—*R. Tyson.*

5582. Melching, William H. **A procedural guide to the programming of instruction: Preliminary report.** *HumRRO res. Memo.*, 1962, Subtask Textstruct II. 34 p.—The prospective programmer is offered an outline covering definitions, desirable characteristics of the programmer, procedures, objectives, development of a criterion test, preparation of a program, preliminary administration, try-out, review, and revision.—*R. Tyson.*

5583. Melching, William H., Cox, John A., Rupe, Jesse C., & Smith, Robert G., Jr. **The text of an orientation workshop in automated instruction.** *HumRRO consult. Rep.*, 1962, Subtask Textstruct II. vi, 79 p.—Orientation on teaching machines and automated instruction as presented at Fort Bliss and Fort Monroe in 1962 are summarized. The nature, advantages, problems, and applications of programmed teaching are outlined; and the evaluation of program proposals is discussed. (Brief glossary of terms, 6 photographic illustrations)—*R. Tyson.*

5584. Norberg, Kenneth. (Ed.) (Sacramento State Coll.) **Perception theory and AV education.** *Audiovis. commun. Rev.*, 1962, 10(5), 1-108.—This issue contains "4 papers . . . which reflect contrasting assumptions and widely divergent interests within the common field investigation": R. Arnheim, "What Do the Eyes Contribute?" J. Hochberg, "The Psychophysics of Pictorial Perception"; H. Toch and M.S. MacLean, Jr., "Perception, Communication, and Educational Research: A transactional View";

and F. Fearing, "Human Communication."—*R. E. Schutz.*

5585. Rabinowitz, William; & Mitzel, Harold E. (City U. New York) **Programing in education and teacher preparation.** *Teachers Coll. Rec.*, 1962, 64(2), 128-138.—Teachers need to be taught how to prepare programs as well as to use teaching machines.—*H. K. Moore.*

5586. Rosenstein, Alvin J., & Kanner, Joseph H. (Army Pictorial Center, Long Island) **Television and army training: Color vs. black and white.** *Audiovis. Commun. Rev.*, 1961, 9(1), 44-49.—25 portraits were each paired with a common name. In 3 experiments these stimuli were presented to groups of college students "simultaneously by all possible combinations of audio, pictorial, and print channels and subsequently tested on the same variations." Analyses of variance indicated that simultaneous presentation of pictorial and verbal information produced interference. Simultaneous audio and printed presentation of verbal information was more effective than either alone.—*R. E. Schutz.*

5587. Silverman, Robert E., & Cohen, Ira S. (New York U.) **A workshop in programmed instruction and programing.** *Psychol. Rep.*, 1962, 10, 719-730.—A description of an intensive 2-week course in programing given to 6 teachers and 6 editorial personnel. The writers conclude from evaluation of programs produced and reactions of participants that "workshops of this nature are feasible and that many if not all teachers can be trained in the rudiments of programmed instruction in comparatively short periods of time if the training is sufficiently intense."—*B. J. House.*

5588. Smith, Norman H. (USAF Academy, Colorado Springs) **The teaching of elementary statistics by the conventional classroom method versus the method of programmed instruction.** *J. educ. Res.*, 1962, 55(9), 417-420.—The Ss were 128 freshman cadets divided in 2 groups, one by the conventional method, the 2nd, by programmed instruction. Neither method of teaching produced better learning. The study indicated that the time required to achieve this learning can be reduced through the application of programmed instruction. The students being taught by this method responded favorably, considered it more efficient, and felt that they had more opportunity to receive individual assistance from the teacher than under more conventional methods.—*F. Goldsmith.*

5589. Smith, Robert G., Jr. **Teaching machines and programmed instruction: Some factors to consider in implementation.** *HumRRO res. Memo.*, 1961, Subtask Textstruct II. 25 p.—An introduction to automated instruction deals with objectives and techniques of programing, costs, standards, administration, and practical suggestions for initiating the process. The 81-page appendix offers sample programs and references.—*R. Tyson.*

5590. Stolurow, L. M., & Walker, C. C. (U. Illinois) **A comparison of overt and covert response in programmed learning.** *J. educ. Res.*, 1962, 55(9), 421-429.—2 groups, a total of 56 Ss, worked through a standard programmed learning test, one group responding overtly (writing), the other covertly (thinking). No reliable differences in learning or retention measures were found. Mean times to

complete the program differed significantly. The covert response group required less time. These data suggest that learning can be more efficient with a covert-response method. (30 ref.)—*F. Goldsmith.*

5591. **Stolurrow, Lawrence M.** (U. Illinois) **Implications of current research and future trends.** *J. educ. Res.*, 1962, 55(9), 519-527.—The author makes the following predictions: Auto-instructional methods and devices are here to stay, teachers will come to grasp their potentialities, and the comparative study of live versus automated teaching will cease. Future research will concern itself with discovering the important characteristics of materials and methods, and this will lead to a theory of teaching. Basic changes in our thinking about what a course is will take place, and courses will be revised as a result of new insights. Research will demonstrate the importance of sequence factors. The devices of the future will be either books or computer-based machines, small devices will drop out. There will emerge a new form of dynamic individualized programming that will be capable of aiding persons to solve problems. (15 ref.)—*F. Goldsmith.*

5592. **Ugelow, Alvin.** **Motivation and the automation of training: A literature review.** *USAF MRL tech. docum. Rep.*, 1962, No. 62-15. iv, 30 p.—Controlling the motivation of learners in their continuing use of the new auto-instructional devices could become a serious problem, since neither the devices themselves nor the performance knowledge they provide seems to maintain extended participation in the instruction. A selective review of the literature on knowledge of results, praise and reproof, competition task interruption, and readability suggests techniques for better controlling such participation. Potentially useful applications are discussed, and limited try-out of variations, both within the program and instructional environment, is encouraged.—*USAF MRL.*

5593. **Wohlwill, Joachim F.** (Clark U.) **The teaching machine: Psychology's new hobby horse.** *Teachers Coll. Rec.*, 1962, 64(2), 139-146.—Criticisms of present work on teaching machines include: (a) its theoretical foundation, (b) the adequacy of this approach in light of learning process, and (c) the narrowness of views of educational process and educational philosophy involved.—*H. K. Moore.*

ATTITUDES & ADJUSTMENT

5594. **Anderson, R. C.** (Harvard U.) **Failure imagery in the fantasy of eighth graders as a function of three conditions of induced arousal.** *J. educ. Psychol.*, 1962, 53(6), 293-298.—An experiment was conducted in which 3 groups of 8th graders (total N = 143) completed a projective test under conditions of low-arousal medium-arousal, and high-arousal respectively. Fear of Failure (f Failure), as well as n Achievement, significantly discriminated the 3 conditions of induced arousal during projective testing. The medium-arousal group rather than the high-arousal group yielded the highest mean f Failure. It was argued that negative results in past research on f Failure may have resulted from anxiety-provoked repression of failure imagery under high-arousal conditions.—*Journal abstract.*

5595. **Astin, A. W.** (National Merit Scholarship Corp., Evanston, Ill.) **Influences on the student's motivation to seek advanced training: Another**

look. *J. educ. Psychol.*, 1962, 53(6), 303-309.—A recent study (see 37: 1939), in which certain college "presses" were interpreted as influencing the student's motivation for advanced training, was re-examined. The method used for controlling the student's initial educational level of aspiration—the analysis of covariance—was thought to be inappropriate, primarily because of anomalies in the correlation between initial and final levels of aspiration. In addition, the estimate of initial level of aspiration, which had been obtained retrospectively from the Ss, was judged to be too undependable for use as a measure of initial level of aspiration. Reanalyses of some of the data failed to support the author's original conclusions about the "effects" of the press on student motivation. Certain methodological problems in studying the influence of college environments on the student were discussed.—*Journal abstract.*

5596. **Blumenfeld, W. S., Franklin, R. D., & Memmers, H. H.** **Youth's attitudes toward civil defense, fallout shelters, and homework.** *Purdue Opin. Panel Poll Rep.*, 1962, No. 65. 39 p.—A questionnaire was administered to a nationally representative sample of high school students in January 1962. The purpose of the pool was to collect information with which to investigate (a) civil defense and fallout shelters and (b) homework and selected teenage values. In reply to "better Red than dead," 27% preferred Red; 71%, dead. 60% of the families had thought about building a shelter but had made no decision. 28% thought it was a good thing for humanity when the atomic bomb was made; 38% thought it was not. 21% thought the United States should spend as much money for medical research as for atomic research; 6% did not. 76% of the students said as much money should be spent for educational research as for atomic research. 21% thought the United States should resume nuclear testing in the air, 48%, underground. 58% thought the building of shelters would make nuclear war more probable. 55% agreed that an attack on the United States would be nuclear, and another 15% said they probably held this view. 37% thought that the possibility of another war was likely; 1%, unlikely; 43% felt there was a 50-50 chance. 42% spent from 1 to 2 hours a day on homework outside of school; 22% spent more than 2 hours. 58% thought that they should spend 1-2 hours; 16%, more than 2 hours. In order of frequency of mention, the things most seriously thought about by students were: plans after school (56%); vocational plans after finishing education (44%); clothes, dress, and appearance (43%); what to think and believe and what is important in life (39%); how to get along with others (31%); homework (27%); social affairs (26%); past experiences (22%); good conduct (22%); TV, sports, musical, or movie stars (20%). 26 pages of tables show frequencies for sex, grade, income, mothers' education, and other variables.—*W. A. Koppe.*

5597. **Brock, Timothy C., & Del Giudice, Carolyn.** (Iowa State U.) **Stealing and temporal orientation.** *J. abnorm. soc. Psychol.*, 1963, 66(1), 91-94.—120 elementary school pupils in a lower-class neighborhood were tested in a situation providing for measures of the occurrence and magnitude of a form of psychopathic behavior (stealing) and of temporal orientation. The 49 Ss who stole money from the E during her brief absence chose fewer temporal con-

cepts and told stories with shorter time durations than the nonstealers. This relationship between stealing and time orientation was uninfluenced by race, sex, age, IQ, academic achievement, or school and home behavior problems.—*Journal abstract.*

5598. Chhiber, K. K. (Chandigarh, India) Secondary school pupils' attitude towards English. *U. Rajasthan Stud. (Educ.)*, 1960, 4, 35-62.—A Thurstone type scale for measuring attitudes (containing 50 items) was standardized. Test-retest reliability was .84. The average Q-value of the items was 1.15; scale values ranged from 8.4 to 0.5. 135 students from 2 secondary schools were given the scale. Students from the progressive multipurpose school showed more favorable attitudes than those from the traditional high school. High positive correlations existed between attitude and attainment.—*U. Pareek.*

5599. Dave, Inder. (Vidyabhan Teachers Coll., Udaipur, India) Measurement of interests. *U. Rajasthan Stud. (Educ.)*, 1960, 4, 63-87.—An instrument (called Ruchi Nidarshaka) was standardized on the lines of the Thurstone Interest Schedule to measure interest of secondary school pupils. 7 interest groups are in the schedule: humanitarian, scientific, technical, commercial, agricultural, fine arts, and home science. It was administered to 97 delta class students. The technical group was the most preferred for boys and the home science group for the girls. The form, in Hindi, appears in the appendix.—*U. Pareek.*

5600. Hassan, Abdel-bassit M. (El-Santa Garbiah, Egypt) Attitudes of America-educated foreign students toward American democratic orientation. *J. soc. Psychol.*, 1962, 57(2), 265-275.—The purpose of the study was to investigate the attitudes of foreign students toward American democratic ideals as carried out by most people in the United States, and to examine the conditions under which they develop their attitudes. The findings of the study indicate that the American educational experience does not ipso facto produce in the foreign student a favorable attitude toward the host culture. Unfavorable attitudes toward the United States can be expected when the foreign student encounters unfavorable experiences through his interaction with Americans and when he is dissatisfied with his academic and social life in the United States.—*Author abstract.*

5601. Hatano, Giyoo. (U. Tokyo) [Q-technique study of parental attitudes toward education.] *Jap. J. educ. Psychol.*, 1962, 10(1), 20-29.—"From analysis of variance of each subject's Q-sort and a factor analysis of the correlation matrix between Q-sorts, the following results were shown: . . . they generally had high loadings on the second factor—that of common-sense viewpoint of education. . . . The attitudes of educational researchers and school teachers were, to the contrary, markedly progressive."—*C. T. Morgan.*

5602. Heilbrun, Alfred B. (U. Iowa) Parental identification and college adjustment. *Psychol. Rep.*, 1962, 10, 853-854.—"Analysis of descriptive ratings supports the hypothesis that higher identification with the father is associated with better adjustment for college males ($N=36$) and, more tentatively, higher identification with the mother is

associated with poorer adjustment for college females ($N=37$)."—*B. J. House.*

5603. Husek, T. R., & Wittrock, M. C. (U. California Los Angeles) The dimensions of attitudes toward teachers as measured by the Semantic Differential. *J. educ. Psychol.*, 1962, 53(5), 209-213.—To investigate the dimensionality of attitudes of education students toward teachers, a form of the Semantic Differential was administered to 259 Ss in an educational psychology course. 1 concept (school teachers) was rated on each of 117 scales. A factor analysis was performed on the resulting data. A large factor of general Evaluation was obtained, and this factor included such attributes as potency and activity—attributes which have often defined their own factors. Other factors, including ones tentatively labeled as Restraint, Tenacity, Predictability, and Stability were also obtained and discussed.—*Journal abstract.*

5604. Johannesson, I. Effects of praise and blame upon achievement and attitudes of school children. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology, Vol. 3. Child and education* (see 37: 4118). Pp. 184-197.—41 classes in Stockholm (4th form) were placed in 5 groups and treated as follows: (a) praised; (b) blamed; (c) praised after 3 tests, blamed before the last test; (d) blamed after 3 tests, praised before the last; and (e) neither praised nor blamed. Pupils also rated own performance and level of anxiety. Performance was influenced by praise or blame, the effect depending upon the combination. No significant differences in anxiety nor attitude toward teacher were found.—*B. T. Jensen.*

5605. Johannesson, Ingvar. Effekter av omgruppering av elever efter sociometrisk val. [The effects of regrouping pupils according to sociometric choices.] *Pedag. Forsk.*, 1962, No. 1, 1-48.—The influence of different forms of choice realization on variation and stability in pupils' choices at repeated sociometric measurements was investigated. 3 degrees of choice realization were employed: (a) maximum realization of the students' positive choices, whereby those with the highest positive preference got the opportunity of working together; (b) minimum realization of the positive choices, whereby those with indifferent feelings toward one another were assigned to work together; and (c) nonrealization, i.e., no restructuring of the class took place. The findings lend "support to the theory that a realization of the pupils' choices through different forms of group formation increases their experiences of their companions and sharpens their social evaluation of each other. However, a regrouping . . . is not enough . . . to bridge oppositions and affect more positive relations. For this . . . guidance and active social education are required." (English summary)—*L. Goldberger.*

5606. Jones, J. B. Some personal-social factors contributing to academic failure at Texas Southern University. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 135-136.—Students matched in tested mental ability, but earning either poor or good grades revealed personality differences. Poor students are more careless, less self-critical, have lower

grade aspirations, and show other significant variations.—*R. Tyson.*

5607. Kishida, Motomi. (Tokushima U.) [Studies of human relations between pupils and teachers.] *Jap. J. educ. Psychol.*, 1962, 10(1), 1-10.—"The relation between pupils' attitudes toward teachers and their attitudes toward school was one of a close correlation, as denoted by a coefficient of correlation which is statistically significant. Thus it was found that the more pupils formed an intimate attachment for their teachers the more they came to like school."—*C. T. Morgan.*

5608. Laponska, R. O stosunkach społecznych między dziewczętami i chłopcami w klasach koedukacyjnych. [Social relations between boys and girls in coeducational classes.] *Psychol. Wych.*, 1962, 5(1), 20-31.—An analysis of 487 essays written by boys and girls between the ages of 13-20 showed that pupils' attitudes toward one another changed during high school. Separatism, antagonism, and egoism disappear but tend to be replaced by cliques. The impact of the latter development on classroom procedures is discussed.—*H. Kaczkowski.*

5609. McConnell, T. R. Differences in student attitudes toward civil liberties. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 29-42.—Studies reveal the extent and nature of the mutual influence of the college and its students. Colleges and student bodies differ widely, and this fact influences the resulting interrelationships.—*R. Tyson.*

5610. Mechanic, David. Students under stress: A study of the social psychology of adaptation. New York: Free Press Glencoe, 1962. vi, 231 p. \$5.00.—A study of the "social dimensions of stress" in an American university. Ss were a group of graduate students. Stress situation consisted of doctoral examinations. Study deals with social interactions of these students during the stress period, their stress-adaptation mechanisms, and their reactions to success and failure. Author reviews the contributions of various scientific disciplines to the concept of stress and concludes that stress can best be understood within the framework of group interaction and influence.—*N. G. Burton.*

5611. Melikian, Levon H. (American U., Beirut, Lebanon) Self disclosure among university students in the Middle East. *J. soc. Psychol.*, 1962, 57(2), 257-263.—Jourard's "Self-Disclosure" questionnaire was adopted and given to 158 male students at the American University of Beirut. The Ss came from Afghanistan, Ethiopia, Greece, Iran, Jordan, Lebanon, Pakistan, and Sudan. Analysis of the results showed the following: (a) no significant difference was found between the 9 groups in self disclosure either to the target persons or in the different aspects of self being disclosed, (b) differences between the different target persons for all Ss and between the different aspects of self disclosure was found, (c) the 6 aspects of self disclosure formed a high and a low cluster similar to Jourard's, (d) the probability that the extent of self disclosure to the target persons was culturally determined was also indicated.—*Author abstract.*

5612. Newcomb, Theodore M. Student peer-group influence and intellectual outcomes of col-

lege experience. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 69-91.—Social-psychological impacts, apart from intellectual development, are increasing on the campus. Large peer groups with sufficient internal variation are desirable. Living arrangements should foster daily contacts. The formal college unit and the living unit should overlap.—*R. Tyson.*

5613. Pace, C. Robert. Implications of differences in campus atmosphere for evaluation and planning of college programs. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 43-61.—Studies involving the College Characteristics Index and the Activities Index lead to 2 conclusions: "To the extent that a college environment is an unrelated assortment of policies and practices and events and features, its influence upon the student is probably small," whereas to the extent that it is "a culture . . . its influence upon the student is probably large."—*R. Tyson.*

5614. Peck, Robert F. Student mental health: The range of personality patterns in a college population. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 161-199.—Intensive female case studies form the basis for an attempt to identify and describe personality patterns in terms of mental health, variety of patterns, and implications. More adequate education requires intensified student guidance and identification of suitable teachers with techniques employed by business and government. (9 case descriptions)—*R. Tyson.*

5615. Phillips, B. N. (U. Texas) Sex, social class, and anxiety as sources of variation in school achievement. *J. educ. Psychol.*, 1962, 53(6), 316-322.—The hypothesis that social class interacts with sex and anxiety to produce differences in school achievement was tested utilizing a sample of 759 adolescents classified into 8 subsamples involving 2 levels of anxiety and social class, and both sexes. 8 measures of school achievement were employed, including standardized tests and teacher grades. The results supported 2 major findings of previous research: females had higher anxiety scores than males, and highly anxious Ss had lower achievement and intelligence scores. Both 1st and 2nd order interactions between sex, social class, and anxiety were found. Difficulties were encountered in integrating these findings into anxiety theory, and certain proposals are offered to accomplish this.—*Journal abstract.*

5616. Pinckney, G. A. (U. Nebraska) Changes in student teachers' attitudes toward childhood behavior problems. *J. educ. Psychol.*, 1962, 53(6), 275-278.—To determine the extent to which a course influences attitudes, 203 students in introductory educational psychology ranked 32 childhood behavior traits on the basis of seriousness. Rankings were made during the 1st and last week of classes, and changes in rank order were analyzed and compared with those of a control group of peers and with the rankings of clinicians in a study done a decade earlier. Precourse rankings of the control and experimental

groups were not reliably correlated with the 1951 clinicians. On postcourse rankings the correlation between the control group and clinicians remained insignificant while the correlation between the clinicians and the experimental group was highly reliable, suggesting that courses can change attitudes.—*Journal abstract.*

5617. **Purdue Opinion Panel.** Youth's attitudes toward the Peace Corps, national security, and education. *Purdue Opin. Panel Poll Rep.*, 1961, No. 63. 29 p.—"This report presents the results for a nationally representative sample of high school students . . . taken during the school year 1960-61. . . . The purpose of the study was threefold. 1) To determine some of the correlates of achievement in English. 2) To obtain national norms for the two forms of the test. 3) To measure teenagers' attitudes toward the following: a) The Peace Corps and national security. b) Plans after high school. c) High school courses and plan of study. d) Reading. e) Educational materials." Youth were found to be very favorable toward the Peace Corps and to value education. Among other things, higher English achievement scores were associated with mother's education; definite plans to go to college; liking mathematics, science, and English; expecting English to be important; owning or having at home more books, magazines, and newspapers; and having a mother who doesn't spend much time reading.—*W. A. Koppe.*

5618. **Putney, S., & Middleton, R.** (San Jose State Coll.) Some factors associated with student acceptance or rejection of war. *Amer. sociol. Rev.*, 1962, 27(5), 655-667.—"During the early 1960's increased concern with the possibility of war led some to reject war as an instrument of national policy and others to attempt to make nuclear war a credible instrument of national policy. This exploratory study attempts to estimate the extent of antiwar sentiment among American college students, and to determine factors which are associated with acceptance or rejection of war. A questionnaire, including three scales measuring acceptance of war was administered to approximately 1,200 students in sixteen colleges and universities across the United States. Males were found far more likely to accept war than females. Residents of the Far West, political liberals, male nonconformists, and those who believe meaningful victory is impossible in a nuclear war were generally less disposed to accept war than their counterparts. In general, however, acceptance of war was found to be positively associated with interest and involvement in modern society, with knowledge and realism concerning nuclear war, and with a sense that war is probable."—*L. Berkowitz.*

5619. **Sanford, Nevitt.** Implications of personality studies for curriculum and personnel planning. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 3-28.—"The liberal college curriculum should further the individual's development by increasing his 'self-control, self-understanding, self-development.' Basic liberal studies offer the most to personality development, the aim of liberal education."—*R. Tyson.*

5620. **Shoben, Edward Joseph, Jr.** Potency in the schools. *Teachers Coll. Rec.*, 1962, 63(7), 548-

550.—"There is no evidence that schools or colleges in general have much if any effect on attitudes, values, and other nonintellective factors. It is, however, hypothesized that some individual schools do because of (a) intimacy of contacts with older students and teachers and (b) the effects of the extent to which the school represents a community to the child."—*H. K. Moore.*

5621. **Sutherland, Robert L., Holtzman, Wayne H., Koile, Earl A., & Smith, Bert Kruger.** (Eds.) *Personality factors on the college campus: Review of a symposium.* Austin, Tex.: Hogg Foundation for Mental Health, 1962. 242 p. \$1.00 (paper), \$2.25 (cloth).—Research, observations, and suggestions dealing with the interaction of institutions of higher education and personality traits of students and staff members are presented. (13-page list of studies in the area) (see 37: 5555, 5557, 5576, 5606, 5609, 5612, 5613, 5614, 5619, 5623, 5632, 5635, 5639, 5676, 5680, 5684).—*R. Tyson.*

5622. **Thistlethwaite, D. L.** (Vanderbilt U.) Rival hypotheses for explaining the effects of different learning environments. *J. educ. Psychol.*, 1962, 53(6), 310-315.—2 explanations advanced to show the artifactual nature of previously reported effects of different learning environments are critically examined. Longitudinal data on a sample of 2405 undergraduate men confirm and extend the previous findings and rule out interpretation of the findings in terms of retrospective errors of recall or in terms of alleged anomalies related to covariance analysis. Men who report that their teachers exert strong press for enthusiasm, humanism, affiliation, independence, achievement, and supportiveness, or who exert weak press for compliance, tend to raise their aspirations for advanced training more than men not reporting such press.—*Journal abstract.*

5623. **Trow, Martin.** Student cultures and administrative action. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 203-225.—4 college subcultures are described as academic, collegiate, nonconformist, and vocational. These are based on 2 variables: involvement with ideas and identification with the college. Less mass, impersonal processing of students would help provide a suitable atmosphere for development of the various student orientations.—*R. Tyson.*

5624. **Zimiles, Herbert, & Konstadt, Norma.** (Coll. City New York) *Orthography and authority: A study of cognitive-affective interaction.* *Psychol. Rep.*, 1962, 10, 623-626.—Negative correlations between a test of "authority conflict" and spelling accuracy were obtained for 43 male and 32 female undergraduates. Results were interpreted as supporting a view that poor spelling results in part from disguised resistance to authority demands.—*B. J. House.*

SPECIAL EDUCATION

5625. **Kellmer Pringle, M. L.** (U. Birmingham) *The long-term effects of remedial education: A follow-up study.* *Vita hum.*, Basel, 1962, 5(1), 10-33.—This is part of a larger follow-up investigation of children who attended the University of Birmingham (England) Department of Child Study. Data

were available on the social and educational history, intelligence, achievement, and personality test scores of 64 boys and 16 girls after completion of their attendance at the department. Questionnaires were filled out by parents relative to the progress of the child from an emotional point of view. The headteachers of those children still in school provided information on the achievement, interests, attitudes, and social and emotional behavior. The great majority of the children are thought to have benefited from the help they received. The headteachers' reports show that most of the children have a good attitude to school work, but the achievement remained low.—J. L. Yager.

Reading

5626. **Rasborg, Finn.** (Danish Inst. Educational Research, Copenhagen, Denmark) *Om muligheden for at konstatere en behandlingseffekt hos læsere-tarderede.* [On the effect of treatment upon reading disability.] *Pedag. Forsk.*, 1962, No. 1, 49-58.—In studies on the effect of treatment upon reading disabilities the pure treatment effect should be isolated from the effect of general development, retest effect, regression effect, and other possible important sources of error. The experimental design should thus include a treatment group, a corresponding untreated group, and a follow-up of both groups. So far only a few studies have met these requirements. (English summary)—L. Goldberger.

5627. **Robeck, Mildred C.** (U. California, Santa Barbara) *Effect of laboratory experience on course work in the teaching of remedial reading.* *Calif. J. educ. Res.*, 1962, 13(4), 154-159.—Findings are reported on a total sample of 140 seniors in elementary and junior high school credential programs in on-campus regular term, off-campus, and summer session work. Those having such laboratory experience did significantly (.001) better than those not, in terms of improvement from mid-term to final examination test scores; a similarly significant difference was found between the performances of those taking 2 units of such laboratory work over those taking 1 unit. The more experienced teachers showed less significant differences.—T. E. Newland.

5628. **Traxler, Arthur E.** *Rapid reading.* *Educ. Rec. Bull.*, 1962, No. 82, 74-75.—Speed-reading advocates fail to discriminate between types of reading material and between reading and skimming. Most people could improve reading rates by regular practice of 5 procedures: (a) systematic vocabulary study, (b) preliminary skimming, (c) closely focused attention, (d) reading in units instead of words, and (e) practice and more practice.—H. H. Gee.

5629. **Vernon, M. D.** (U. Reading) *Adult reading.* *Indian psychol. Bull.*, 1958, 3, 52-54.—A discussion of the reading habits and eye-movement habits of a poor reader and a good reader. A poor reader cannot be turned into a good reader merely by drilling his eye movements without improving his habits of grasping the reading material as a whole. 2 experiments are cited that suggest appreciably low reading ages of Chinese matriculates and Bangali undergraduates in comparison with 2 groups of younger English children of comparable intelligence.—S. L. Mishra & K. Ray-Chowdhury.

Mental Retardation

Gifted Students

EDUCATIONAL GUIDANCE

5630. **Bereiter, Carl.** (U. Illinois) *Using tests to measure change.* *Personnel Guid. J.*, 1962, 41(1), 6-11.—It is hypothesized that present test construction methods may result in tests which are not responsive to differential changes supposedly produced by counseling and guidance. The general goals of predictive efficiency in current tests entail a concentration on unchanging characteristics of people. Approaches are suggested which direct test results to yield indices of change rather than of status.—S. Kavruck.

5631. **Bloland, Paul A.** (Drake U.) *The role of the student organization adviser.* *Personnel Guid. J.*, 1962, 41(1), 44-49.—The student organization adviser functions in 3 major areas: Maintenance, in which the adviser merely maintains and supports the organization; Group Growth, in which the adviser improves the operation and effectiveness of the group in its progress towards stated goals; and Program Content, in which the adviser answers the question "For what?" (24-item bibliogr.)—S. Kavruck.

5632. **Brown, William F.** *Academic adjustment counseling through peer group interaction.* In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 131-135.—An experimental program using peer group discussions of test results, problems, and remedial actions won considerable student acceptance. Women's grades improved significantly although men's did not. Male counselors were slightly more effective.—R. Tyson.

5633. **Davis, J. A., & Bradburn, N.** (U. Chicago) *Great aspirations: The career plans of America's June 1961 college graduates.* *Voc. Guid. Quart.*, 1962, 10(3), 137-142.—A condensed version of a National Opinion Research Center (NORC) report of a representative nationwide sampling via questionnaires of June 1961 graduates. Replies were obtained from 33,782 graduating seniors at 135 schools. Plans for further study were reported by 77% of this group. Approximately 33% said they planned to continue their education in Fall 1961 but, as of 2 months before graduation, only 20% reported acceptance by a graduate school. NORC follow-up studies through 1965 are planned to determine actual outcomes. Only a small number (18%) report any financial difficulties. Of seniors who planned on graduate work for Fall 1961, the largest number (20%) reported plans for education; the 2nd most popular field was humanities (13%). Increasingly, students are electing the more "verbal" fields for graduate training (social science, business, humanities, law) as against physical science, engineering, and medicine. 67% said they felt the most important purpose of college was to get a basic general education; but only 38% felt this attitude was typical of the average student at his own institution.—W. L. Barnette, Jr.

5634. **Diffenbaugh, Donald J., & Bowman, Douglas J.** *Guidance services at the intermediate level.* *Personnel Guid. J.*, 1962, 41(1), 25-28.—

Research indicates increased emphasis on an intermediate level of guidance coordination. The states will determine the level. States which are pace-makers in establishing county-level guidance services, such as Florida, California, and Ohio, will probably indicate trends.—S. Kavruck.

5635. Farnsworth, Dana L. Who really helps our students? In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 93-109.—Deans of admission, deans of students, teachers, and parents all can and should play a role. Perhaps, eventually, specialized counselors such as psychiatrists and psychologists will be unnecessary.—R. Tyson.

5636. Green, D. A. (Ohio U.) A study of talented high school drop-outs. *Voc. Guid. Quart.*, 1962, 10(3), 171-172.—Data were obtained from a 1958 study involving a random, statewide (Iowa) sample of high school students of which approximately 10% were "talented" (an IQ of 120 or better). Of this group, 17.6% had dropped out of school. "Drops" were then compared with "persisters" and were matched for IQ score, school size, and sex. Of 29 pairs thus formed, 21 responded to a mailed questionnaire. Drop-outs had a significantly lower high school GPA, engaged in significantly fewer extracurricular activities, and were significantly more frequently absent.—W. L. Barnette, Jr.

5637. Heilbrun, Alfred B., Daniel, John L., Goodstein, Leonard D., Stephenson, Richard R., & Crites, John O. (Iowa U.) The validity of two-scale pattern interpretation on the California Psychological Inventory. *J. appl. Psychol.*, 1962, 46(6), 409-416.—The validity of 2-scale pattern interpretation for the CPI was assessed within a college counseling service population. Groups representing high and low score combinations on the Dominance and Good Impression scales were constituted, and the self-descriptive adjectives from the Adjective Check List which differentiated these groups from a representative counseling service groups were determined. These clusters of self-descriptive terms were generally consistent with the personality types which would be anticipated, based on the combined meanings of high and low scores on the individual scales as evidenced by high matching accuracy of expert judges. These results provide gross validation support for 2-scale pattern interpretation on the CPI.—*Journal abstract.*

5638. Keppers, George L., & Caplan, Stanley W. Group counseling with academically able underachieving students. *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1962, No. 1, 12-17.—28 10th-grade boys with IQ 110 or above and grades less than C were randomly assigned to 1 of 4 group counseling situations: (a) boys counseled; (b) parents counseled, but not their boys; (c) parents and boys counseled in separate groups; and (d) controls, no counseling. Group counseling took place in 12 weekly sessions of 60 minutes each. The boys in the 2nd group showed increased congruence in self-ideal Q sorts (significant at 1%).—J. G. Cooper.

5639. Kelly, H. Paul. Counseling research program in a large state university. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus:*

Review of a symposium (see 37:5621). Pp. 125-131.—An outline of research under way in a state university includes studies of vocational choice, experience affecting college performance, the role of a counseling center, client characteristics, evaluation of changes during counseling, client-counselor relationships, group counseling, and counseling predictions based on information given.—R. Tyson.

5640. Krippner, S. (Kent State U.) The occupational experiences and vocational preferences of 351 upper-middle class junior high school pupils. *Voc. Guid. Quart.*, 1962, 10(3), 167-170.—Data on part-time work experiences and career goals were obtained from 189 boys and 162 girls in 7th and 8th-grade classes of an upper middle class Chicago suburban school system. Boys (53%) report significantly more part-time work experience than do girls (36%), but the girls' experiences are more in line with their eventual career goals (teaching, nursing, clerical) than are the boys'. The vocational preferences of the boys are not based on first-hand experience, and this is seen as a genuine school and community lack.—W. L. Barnette, Jr.

5641. Singh, B. K., & Prasad, R. C. Occupational preferences of the students of psychology at the Patna University. *Psychol. Stud., Mysore*, 1962, 7(2), 20-30.—Occupational prestige and stereotypes were found to be the most potent determinants of occupational choices. Many students were vocationally immature.—U. Pareek.

EDUCATIONAL MEASUREMENT

5642. Anselmi Zanovello, E. Inizio dell'orientamento come processo educativo in una scuola media unificata: Diagnosi di maturità sociale. [Beginning orientation as educational process in a unified junior high school: The diagnosis of social maturity.] *Riv. Psicol. soc.*, 1962, 29(1), 117-126.—Social adjustment, sociometric choices, and intelligence in a rural sample are somewhat related to familiar background.—L. L'Abate.

5643. Arnett, Chappelle. (Western Washington State Coll., Bellingham) The Purdue Motor Fitness Test Batteries for senior high school girls. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 323-328.—The purpose of the study was to develop short (minimum item) motor fitness test batteries for high school girls which could be economically administered in terms of equipment and class time. The components which might contribute to motor fitness were listed and appropriate items pertaining to the components were selected for their content validity and suitability. Utilizing appropriate statistical techniques, the modified pull-up, 600-yd. run, and standing broad jump were selected as the items for the batteries. The Purdue Motor Fitness Test Battery No. 1 was recommended over the other 3 batteries since this battery had a validity coefficient of at least .755 and an estimated reliability coefficient of .848.—*Journal abstract.*

5644. Burgess, Thomas C., & Wright, Dolores D. (Montana State U.) Seventh-grade evaluation of the Ammons Quick Test (QT). *Psychol. Rep.*, 1962, 10, 791-794.—"The equivalent-forms reliability and validity of the Ammons Quick Test were checked on seventh grade students in a single Missoula elementary school. Reliability coefficients ranged from

.56 to .79. Correlations with measures of achievement varied from .12 to .81 using school marks, and from .13 to .63 using scores from the Iowa Test of Basic Skills. Item difficulties appeared to be distributed in a reasonably appropriate fashion."—*B. J. House.*

5645. **Carter, Harold D.** (U. California, Berkeley) **How reliable are good oral examinations?** *Calif. J. educ. Res.*, 1962, 13(4), 147-153.—"Analysis of data from a sample of 250 candidates in a field of medical specialization (anesthesiology) has revealed evidence of high reliability (.81) of a set of oral examinations, and evidence of only moderate agreement (.45) between measures provided by written and oral examinations in the same field of competence." Data are provided on interrater reliabilities—between the less experienced examiners, between the more experienced examiners, and between these 2 groups.—*T. E. Newland.*

5646. **Champaign Community Unit Schools, Department of Special Services Staff.** (Champaign, Illinois) **Factors associated with underachievement and overachievement of intellectually gifted children.** *Except. Children*, 1961, 28, 167-175.—"The findings of this study suggest that the high educational achievement of intellectually gifted pupils in the elementary grades is related significantly to creativity and a high degree of perceived peer acceptance. . . . Although other factors investigated (parental attitudes, self-concept, and social maturity) were not found to be related to achievement, the overachievers scored more favorably on most instruments and were generally better adjusted socially and emotionally." The educational implications are discussed.—*J. Z. Elias.*

5647. **Cowell, Charles C.** (Purdue U.) **Test of ability to recognize the operation of certain principles important to physical education.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 376-380.—A preliminary test composed of 90 items culled from an original 100 was administered to 288 college seniors or master's candidates in professional physical education from 7 universities. Statistical purification resulted in the retention of 50 of the original items on the basis of their respective indexes of discriminating power and degree of difficulty. The internal consistency reliability coefficient of .78 on the 50-item test was deemed satisfactory for a test which is a composite of a number of factors such as general intelligence and knowledge of social psychology, physiology, mental hygiene, and numerous other disciplines from which the principles related to physical education situations were drawn.—*Journal abstract.*

5648. **Elkind, David.** (U. Denver) **Quantity conceptions in college students.** *J. soc. Psychol.*, 1962, 57(2), 459-465.—240 college students were tested for their conceptions of mass, weight, and volume in a replication of studies previously carried out with children and adolescents. While 92% of the college students had abstract conceptions of mass and weight only 58% had abstract conceptions of volume. The per cent of men was significantly greater than the per cent of women having an abstract volume conception. The only finding at variance with the results from high school students was that in college women, but not in college men, the per cent of vol-

ume conceptions increased with age. This finding was, however, in keeping with the hypothesis (used to explain either of the results) that some special roles are more conducive than others to the attainment of the abstract conception of volume.—*Author abstract.*

5649. **Feldt, L. S.** (State U. Iowa) **The reliability of measures of handwriting quality.** *J. educ. Psychol.*, 1962, 53(6), 288-292.—This paper reports a reliability analysis of measures of handwriting quality. Components of variance techniques are employed to assess the magnitude of measurement errors arising from various sources. The data indicate that the reliability of quality measures, as typically obtained in elementary school classrooms, is quite low. In Grades 1 and 2 the coefficients for measures based on a single day's writing sample range from .4 to .6. Systematic variation among teachers in the harshness of their judgments is shown to be a particularly important source of error. Suggestions are offered for improving the reliability of handwriting evaluations.—*Journal abstract.*

5650. **Flanagan, J. C.** (American Inst. Research) **Project TALENT: A national inventory of aptitudes and abilities.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress on Applied Psychology. Vol. 5. Industrial and business psychology.* (see 37: 4120). Pp. 53-68.—440,000 secondary school students in the United States answered approximately 2000 items of information in March 1960. They will be followed up 1, 5, 10, and 20 years after graduation. Some comparisons of students at various grade levels are presented as are some sample test questions.—*B. T. Jensen.*

5651. **Korman, Maurice.** (U. Texas Southwestern Medical School) **A factorial study of judgmental space.** *Psychol. Rep.*, 1962, 10, 739-746.—"Fifty-five members of a medical school faculty evaluated 216 applicants and rated them on 23 assessment and prediction scales. A factor analysis was performed on these data as well as on objective achievement and personality measures. The results suggested the presence of three particularly interesting dimensions in these judges' 'clinical space': (1) The Ideal Medical Student which overlapped considerably with the judge's own role and self-concept; (2) Orientation to Material Success; and (3) Service Orientation of The General Practitioner.—*B. J. House.*

5652. **Odom, Robert R.** (Los Angeles State Coll.) **Sequence and grade placement of punctuation skills.** *Calif. J. educ. Res.*, 1962, 13(4), 179-185.—On the basis of data obtained from 1818 4th-, 5th-, and 6th-grade pupils to the author's diagnostic test, an attempt was made to determine the placement of 49 specific punctuation skills on the basis of "mental age level" (test unspecified).—*T. E. Newland.*

5653. **Ray-Chowdhury, K.** (Muslim U., Aligarh, India) **An experiment with construction of tests of interests at the university level.** *Indian psychol. Bull.*, 1957, 2, 7-11.—A study of the reliability of self-assessed interests by Interest Survey (IS) and of objectively measured interests by means of Information Test (IT). Both IT and IS covered 12 areas to be measured: artistic, business, constructional-mechanical—for men only, domestic—for women only, gregarious, handicraft, literary, musical,

outdoor and physical activities, scientific, dramatic and theatrical, and welfare-humanitarian. Like-dislike items were chosen under occupations, periodicals, further educational training, and leisure time activities. IS (containing 190 questions) and IT (containing 197 items) were given to 70 teachers-under-training of the London University in 1954-55. Pattern coefficients were as follows: men = .480; and women = .278. The means of separate "r" coefficients were: men = .349; and women = .231.—*A. K. Ganguly & S. L. Mishra.*

5654. Reger, Roger. (Wayne County Training School, Northville, Mich.) **Brief tests of intelligence and academic achievement.** *Psychol. Rep.*, 1962, 11(1), 82.—"The Peabody Picture Vocabulary Test IQs for 25 boys in a residential program correlated significantly with IQs from the Wechsler Intelligence Scale for Children. Arithmetic and reading scores on the Wide Range correlated significantly with similar scores on the Metropolitan achievement tests."—*B. J. House.*

5655. Reid, J. W., Johnson, A. P., Entwisle, F. N., & Angers, W. P. **A four-year study of the characteristics of engineering students.** *Personnel Guid. J.*, 1962, 41(1), 38-43.—College candidates likely to attain the Bachelor of Sciences degree at the Newark College of Engineering are those who like scientific, computational, and/or mechanical or artistic activities; who do well on mathematical aptitude tests and math achievement tests; and who achieve well in the high school.—*S. Kavruck.*

5656. Watley, Donivan J., & Martin, H. T. (U. Denver) **Prediction of academic success in a college of business administration.** *Personnel Guid. J.*, 1962, 41(2), 147-154.—The study sought to determine the effectiveness of certain test measures in relation to academic success and the development of regressive equations for prediction purposes based upon those measures in relation to academic success. The tests included the following: Guilford-Zimmerman Temperament Survey (GZTS), Scholastic Aptitude Test (SAT), Strong Vocational Interest Blank, Bruce Business Judgment Test, Bruce Supervisory Practices Test, Allport-Vernon-Lindzey Study of Values, and Minnesota Paper Form Board Test (Revised). The GZTS plus the SAT (Mathematics and Verbal) and high school rank yielded an R of 0.82 with GPA. Findings are presented in relation to females and other tests.—*S. Kavruck.*

5657. Wevrick, Leonard. (U. Sydney) **Response set in a multiple-choice test.** *Educ. psychol. Measmt.*, 1962, 22(3), 533-538.—Through the use of a 100-item vocabulary test given to 249 university freshmen, positional response set was established. Positional bias may be induced by having the correct alternative occupy a given position with a greater than chance frequency for the whole test.—*W. Coleman.*

5658. Willingham, Warren W. **College performance of fraternity members and independent students.** *Personnel Guid. J.*, 1962, 41(1), 29-31.—Fraternity members and independent students were compared with regard to attrition during freshman year, freshman grades, and 4-year grades. Fraternity pledges have somewhat lower attrition rates during the freshman year. Fraternity members have grades

as high as or higher than those of independent students.—*S. Kavruck.*

Aptitudes

5659. Cooper, James G. **The Culture-Free Intelligence Test in a college of the western Pacific.** *Personnel Guid. J.*, 1962, 41(2), 123-125.—The study attempted to answer 3 questions: (a) How do the scores on 2 forms of the Cattell Culture-Free Intelligence Tests vary in the typical College of Guam student population? (b) To what extent is variation in scores a function of order of administration? (c) Which order of administration gives the best prediction of academic achievement? The test, while showing satisfactory reliability did not predict academic achievement. Further research is needed in this area. The test cannot be considered useful with students from the western Pacific.—*S. Kavruck.*

5660. Whitla, Dean K. (Harvard U.) **Effect of tutoring on Scholastic Aptitude Test scores.** *Personnel Guid. J.*, 1962, 41(1), 32-37.—Using matched control and experimental groups, the effects of tutoring on SAT scores was examined. All investigations to date indicate that last-ditch tutoring produces negligible results.—*S. Kavruck.*

Achievement

5661. Goodstein, Leonard D., & Heilbrun, Alfred B. (U. Iowa) **Prediction of college achievement from the Edwards Personal Preference Schedule at three levels of intellectual ability.** *J. appl. Psychol.*, 1962, 46(5), 317-320.—The scores on the Edwards Personal Preference Schedule (EPPS) were correlated with the semester grade point average on a sample of 357 undergraduates, 206 males and 151 females, with the variance attributable to a brief vocabulary test estimate of scholastic ability partialled out. While the results of the analysis of the total male and female groups were essentially negative, further analyses which followed a subdivision of each of the 2 sex groups into low, middle, and high ability groupings yielded more promising results, especially for the middle ability male subgroup. Following a comparison of the obtained results with previous studies, the importance of using levels of intellectual ability as a control variable in studies of nonintellectual factors in achievement was noted.—*Journal abstract.*

5662. Hurley, John R. (Michigan State U.) **Achievement pressure: An attitudinal correlate of college course grades.** *Psychol. Rep.*, 1962, 10, 695-702.—"An attitudinal measure of the construct of achievement pressure (AP), defined as the tendency to impose social achievement demands upon children, was described which correlated about -.40 with the grades earned by college students. . . . This AP index was essentially unrelated to intelligence as measured by standard college aptitude tests and correlations between AP and course grades rivaled those between grades and the aptitude indices. . . . If it is assumed that the students' AP scores are directly related to the achievement pressure exerted by their own parents, these results are sharply inconsistent with prior reports that parental achievement pressure facilitates scholastic success at subcollege levels." An attempt is made to account for the discrepancy.—*B. J. House.*

5663. Jungeblut, Ann. Summary of test results. *Educ. Rec. Bull.*, 1962, No. 82, 1-56.—Achievement of independent school pupils continued to exceed that of public school pupils by wide margins in all areas except foreign language, geometry, and trigonometry. Cumulative norms are now based on results obtained in 1956 and later. They still give evidence of growth in achievement from year to year which parallels growth noted in Fall aptitude testing programs. Results of the 1962 program are described and discussed with the aid of 44 tables.—H. H. Gee.
5664. Keller, E. Duwayne, & Rowley, Vinton N. (State U. Iowa) Anxiety, intelligence, and scholastic achievement in elementary school children. *Psychol. Rep.*, 11(1), 19-22.—Among 4th-, 5th-, and 6th-grade children, "correlations between anxiety and intelligence were negative, with only that for sixth-grade girls being significant. All the correlations between school achievement sub-tests and intelligence were significant. . . . An attempt to increase the efficiency of predicting scholastic achievement using anxiety and intelligence as predictor variables led to some improvement for sixth-grade girls and fourth-grade boys only."—B. J. House.
5665. Merenda, Peter F., Hall, Charles E., Clarke, Walter V., & Pascale, Alfred C. (U. Rhode Island) Relative predictive efficiency of the DAT and a short multifactor battery of tests. *Psychol. Rep.*, 1962, 11(1), 71-81.—"A new multifactor battery consisting of 8 short tests, requiring a total of 42 min. of test-taking time, was administered to the entire eleventh grade of a large city high school. The class had previously been administered the DAT battery, consisting also of 8 tests but requiring 186 min. of test-taking time, in the eighth grade. Analysis of these joint data revealed that the batteries are highly correlated, that they measure essentially the same three factors, and that they yield substantially the same predictive validities in determining the final grades obtained by Ss in eleventh and twelfth grade courses in" a variety of courses.—B. J. House.
5666. North, Robert D. Results of the ERB Mathematics Tests in the 1962 spring program. *Educ. Rec. Bull.*, 1962, No. 82, 57-62.—In the spring of 1962, new mathematics tests reflecting curriculum changes in mathematics teaching were offered for the 2nd time. These tests cover (a) analytical geometry; (b) sets, equations, inequalities, and number concepts; (c) probability and statistics; and (d) introductory calculus. Nearly 300 pupils were tested in geometry and sets in 1962, representing a substantial increase in numbers over 1961. However, median achievement levels in these 2 areas dropped considerably from the levels attained in 1961, even though teachers' ratings of items indicated the 1962 items were similarly within the curricular coverage of their courses. The number of students tested in introductory calculus increased over 1961 from 104 to 178; probability and statistics tests were taken by only 46 pupils (45 in 1961). The median achievement level in calculus was approximately equal to 1961; the probability and statistics median, however, nearly doubled the 1961 level, with parallel ratings of appropriateness of items.—H. H. Gee.
5667. North, Robert D. Interpretation of students' records as reported on the Transcript for Admission to Independent Schools. *Educ. Rec. Bull.*, 1962, No. 82, 63-73.—Several specimens of actual records of students from an independent elementary school are presented and analyzed to demonstrate use and utility of a transcript and commentary form newly developed in 1961. Designed by a joint committee of the Independent Schools Education Board and the Educational Records Bureau, the new form encourages uniform transcripts for presentation by public and independent elementary schools to independent secondary schools.—H. H. Gee.
5668. Peel, E. A. (U. Birmingham, England) Curiosity and interest in motivating school learning. (In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology*. Vol. 3. *Child and education* (see 37: 4118). Pp. 153-160.—"Interest in school work and general curiosity are successful predictors of achievement."—B. T. Jensen.
5669. Rao, S. Narayan. Predicting academic achievement of students in science and arts colleges. *Psychol. Stud.*, Mysore, 1962, 7(2), 16-19.—Using 4 predictors with 220 students achievement was reliably predicted. The best single predictor was found to be the performance in the pre-university examination.—U. Pareek.
5670. Rosenberg, Leon A., McHenry, Thomas B., Rosenberg, Anna Maria, & Nichols, Robert C. (Fort Sam Houston, Medical Field Service School, Tex.) The prediction of academic achievement with the California Psychological Inventory. *J. appl. Psychol.*, 1962, 46(6), 385-388.—An attempt to use the California Psychological Inventory to predict the academic grades of students in 3 military courses: Neuropsychiatric, Clinical Psychology, and Social Work Procedures. The data indicated that a combination of the Achievement via Independence scale of the California Psychological Inventory and the General Technical score from the Army Classification Battery, makes an effective instrument for screening students for admittance to these courses. The predicted criterion scores, obtained from 2 multiple prediction equations, were correlated with the academic grades achieved by students in 2 samples ($N = 98$; $N = 64$). The obtained r 's were .610 and .600 ($p < .01$). Cross-validation correlations were obtained with 2 new samples ($N = 35$; $N = 33$). The obtained r 's were .631 and .558 ($p < .01$).—*Journal abstract*.
5671. Rouart, Julien; Narlian, Raymonde, & Simon, Janine. (Inst. Edouard Claparede) L'échec scolaire: Etude clinique, structurale et dynamique. [School failures: A clinical study of the structure and dynamics.] *Psychiat. Enfant*, 1960, 3(2), 333-403.—School failure is considered as a psychiatric syndrome underlying affective difficulties. It is generally part of a clinical syndrome with multiple and varied determinants. Clinical observations of the symptoms reveal difficulty in the means of acquisition and use of learning. Etiological factors can be environmental as well as inner determined. Psychotherapeutic or pedagogic reeducation should take into account both the environmental circumstances which precipitated the failure as well as the child's personality structure.—R. Naar.
5672. Sarason, Irwin G. (U. Washington) Test anxiety and intellectual performance. *J. abnorm. soc. Psychol.*, 1963, 66(1), 73-75.—High school stu-

dents were administered 2 anxiety scales, the Test Anxiety Scale and a Need for Achievement scale. Scores on these tests were related to scores on the School and College Ability Test (SCAT). Test anxiety was found to be negatively correlated with SCAT scores. The negative correlations obtained tended to be larger for female than for male Ss. The Need for Achievement scale showed only a slight tendency to correlate negatively with SCAT scores. The results were interpreted as being consistent with the conception of anxiety as an interfering non-intellectual influence on intellectual performance.—*Journal abstract.*

5673. Schonell, F. J. School failure. *Indian psychol. Bull.*, 1958, 3, 30-44.—This paper, written by the author after attending the international seminar in Hamburg in 1956, is reprinted from *Slow Learning Child*.—S. L. Mishra & K. Ray-Chowdhury.

[Contribution to the study of prediction in academic success.] *Riv. psicol. soc.*, 1962, 29(1), 113-116.—Correlations and multiple regression equations between intelligence tests and scholastic grades are all positive.—L. L'Abate.

EDUCATIONAL PERSONNEL

5676. Allen, Lucile. A study of role conflicts and congruences encountered by the new faculty member as he enters the culture of a college or university community. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 142-144.—Interviews with Austin College faculty members showed changes in views of college aims on the part of new arrivals, little appreciation of promotion procedures, and an unexpectedly large number of teachers with foreign-born parents.—R. Tyson.

5677. Burkard, M. I. (Mt. Mary Coll.) Discernment of teacher characteristics by TAT sequence analysis. *J. educ. Psychol.*, 1962, 53(6), 279-287.—What are some of the underlying personality factors that distinguish teachers rated by their pupils at the extremes in teaching efficiency? 300 religious women teaching in Grades 4 through 12 were rated by their classes (10,720 pupils). TAT sequence analysis of 1200 stories of high-rated and low-rated paired samples yielded clearly distinguishing characteristics in the 2 groups ($p < .001$). The high-rated teachers showed a basic disposition to respond to life realistically and constructively, while the low-rated ones did not. Results were verified by the successful assignment of the teachers to the high or low group on the basis of their positive or negative scores on the empirically established criteria.—*Journal abstract.*

5678. Cook, Desmond L. (Purdue U.) A note on the relationship between MTAI and GZTS scores for three levels of teacher experience. *J. educ. Res.*, 1962, 55(8), 363-367.—Beginning and student teachers show similar relationships between Minnesota Teacher Attitude Inventory scores and each of the various Guilford-Zimmerman Temperament Scale traits but these relations differ from experienced teachers primarily in that the correlations are higher for the latter group. The increasing size of correlations with teaching experience suggests that there may be personality changes taking place with increased participation in professional work.—F. Goldsmith.

5679. Dutton, Wilbur H. (U. California, Los Angeles) Attitude change of elementary school student teachers and anxiety. *J. educ. Res.*, 1962, 55(8), 380-382.—The Minnesota Teacher Attitude Inventory was given to 91 elementary school student teachers at the University of California, Los Angeles upon entry and at the end of a semester of student teaching. Both highly anxious and nonanxious elementary school student teachers changed their attitudes toward youth in a negative direction. The influences of student teaching may be a critical factor in the development of teachers' attitudes toward children. Education students not engaged in practice teaching maintained their high positive attitudes toward children. The study suggests practice teaching situations may be unduly stressful.—F. Goldsmith.

5680. Evans, Richard I. Values and attitudes of university professors: Some general and specific findings. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of a symposium* (see 37: 5621). Pp. 157-159.—Preliminary results of research with professorial resistance to change reveal hesitation about television instruction because lectures would be bared to colleagues and administrators. Actual television experiences lower resistance. Professors regard themselves as good teachers, "rough, honest, active, fair, strong, fast, pleasant, hard, and valuable."—R. Tyson.

5681. Fleming, C. M. (U. London) Psychology and the work of a teacher. *Indian psychol. Bull.*, 1957, 2, 31-36.—A discussion, with a brief historical reference to the changing notion of a teacher's task in Great Britain since the beginning of the 20th century, of the present problems of a teacher. The work of a teacher is now both more exciting and more enthralling than it was in the middle years when acceptance of the inevitability of failure for pupils who had once been streamed as C or D reduced the self-respect of many teachers and led many parents to despair.—A. K. Ganguly & K. Ray-Chowdhury.

5682. Greene, James E., Sr., & Scott, Mary Hughie. (U. Georgia) Personal characteristics associated with certain motives for choosing teaching as a vocation. *Psychol. Rep.*, 1962, 11(1), 199-202.—Scores on the Lang Scale of Motives for Teaching were related to 12 personal characteristics such as grades, socioeconomic factors, etc. for 482 prospective women teachers. It was concluded that Ss who attributed relatively great importance to socially acceptable motives tended to have generally desirable characteristics for the teaching profession.—B. J. House.

5683. Leftwich, William H., & Remmers, Hermann H. (U. Richmond) A comparison of graphic and forced-choice ratings of teaching performance at the college and university level. *Stud. higher Educ.*, 1962, No. 92. 35 p.—The Purdue Rating Scale for Instruction (graphic scale) and the Purdue Instructor Performance Indicator (forced-choice scale) were completed by 2109 students rating 80 faculty members at a large midwestern university. In this study an attempt was made to combine the diagnostic advantages of a graphic scale with certain advantages of a forced-choice scale, that of less susceptibility to certain rater tendencies. Based on the results of factor analysis, revised scoring procedures were developed. Findings suggest further research is warranted.—R. M. Frumkin.

5684. McGee, Reece. Some occupational concomitants of academic degrees. In R. L. Sutherland, W. H. Holtzman, E. A. Koile, & B. K. Smith (Eds.), *Personality factors on the college campus: Review of symposium* (see 37: 5621). Pp. 144-157.—A survey of college faculty members revealed that common knowledge about academic employment is "more or less true in a vague and general way." Some misapprehension appeared in wrongly assuming the necessity of the doctorate.—R. Tyson.

5685. Scandrette, Onas. (Wheaton Coll.) Differential need patterns of women elementary and secondary level student teachers. *J. educ. Res.*, 1962, 55(8), 376-379.—73 student teachers preparing to teach on the elementary level and 89 students preparing to teach at the secondary level completed the Edwards Personal Preference Schedule. Statistically significant differences between the mean scores of elementary and secondary student teachers were found for autonomy, affiliation, dominance, and aggression. Secondary level student teachers' scores are closer to the liberal arts norm group than those of the elementary student teachers.—F. Goldsmith.

INDUSTRIAL & MILITARY PSYCHOLOGY

5686. Karn, Harry W., & Gilmer, B. von Haller. (Carnegie Inst. Technology) *Readings in industrial and business psychology*. (2nd ed.) New York: McGraw-Hill, 1962. xi, 515 p. \$6.95 (cloth), \$4.95 (paper).—58 previously published articles in the field of industrial and business psychology. 50 of the articles were published after 1954, none prior to 1951. Included are readings in classical topic areas, engineering psychology, criterion problems, and organizational behavior.—R. C. Browning.

5687. Milburn, Thomas W. (China Lake, Calif.) *Space crews, psychology, and American society*. *J. soc. Issues*, 1961, 17(2), 24-28.—A discussion of certain implications drawn from the necessity for multiple crew situations in space exploration, with particular regard to the interpersonal stresses involved.—A. Barclay.

5688. Murphy, Gardner. (Menninger Found.) *Testing the limits of man*. *J. soc. Issues*, 1961, 17(2), 5-14.—The author discusses, from a broad cultural perspective, the social pressures impelling space exploration, together with some discussion of factors of human endurance in the pursuit of such explorations.—A. Barclay.

5689. Oshanin, D. A. (Ed.) *Psikhologiya promyshlennogo truda*. [The psychology of industrial work.] *Izv. Akad. Pedag. Nauk RSFSR*, 1962, No. 119, 152 p.—These transactions of the Institute of Psychology are devoted to reports of research analyzing the psychological aspects of various industrial operations.—I. D. London.

5690. Sells, S. B. (Texas Christian U.) Some implications of astronautical research for human affairs. *J. soc. Issues*, 1961, 17(2), 15-23.—"This brief survey has commented on a number of aspects and by-products of the . . . space sciences and technologies with particular reference to their impacts on society and human affairs."—A. Barclay.

5691. Viteles, M. S. (U. Pennsylvania) *Man, mind, and machines*. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology*. Vol. 5. *Industrial and business psychology* (see 37: 4120). Pp. 9-25.—Automation brings fears. The nature of the fear is discussed and some means of dealing with it suggested. There is need for research on transferability. (41 ref.)—B. T. Jensen.

VOCATIONAL GUIDANCE & APTITUDES

5692. Gordon, Leonard V., & Anderson, Adolph V. (USN Personnel Research Field Activity, San Diego) *A factor analysis of interests in certain skilled occupations*. *Educ. psychol. Measmt.*, 1962, 22(3), 473-483.—An interest inventory containing 300 items was developed for use with Navy recruits. The responses of a sample of 400 recruits were factor analyzed yielding 8 factors: clerical, electrical-electronic, mechanical, medical-dental, navigation, aviation, hazardous duty, and service. The factors are described and illustrated with sample items. The factors are compared with those found by Guilford et al. (see 29: 4727) for professional level occupations.—W. Coleman.

5693. Helme, W. H., Graham, W. R., & Anderson, A. A. Development of ACB Automotive Information and Clerical Speed Tests, Forms 3 and 4. *USA Personnel Res. Off. OCRD Tech. Res. Rep.*, 1962, No. 1122. 24 p.—In response to the continuing requirement to increase effectiveness of the operational Army Classification Battery, 2 new forms of the Automotive Information Test (AI) and Army Clerical Speed Test (ACS) were developed. Emphasis was placed on updated content for the AI forms and shorter length and improved format for the ACS. The tests were administered experimentally, along with the original operational forms, to 728 enlisted men. The new forms (AI-3 and -4 and ACS-3 and -4) proved reliable measures of aptitudes required for jobs in the Motor Maintenance (MM) and Clerical (CL) occupational areas, and correlated sufficiently with the prior Forms 1 and 2 (.84-.90 for AI; .69-.86 for ACS) to warrant their use as replacements in the ACB.—A. J. Drucker.

5694. Paterson, D. G. (U. Minnesota) *Values and interests in vocational guidance*. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology*. Vol. 5. *Industrial and business psychology* (see 37: 4120). Pp. 118-125.—After presenting data regarding prestige ranking of occupations showing, in part, similarity among 3 countries, follow-up studies are cited to show con-

sistency between Strong Vocational Interest Blank responses and occupations 18 years later. (15 ref.)—*B. T. Jensen.*

5695. **Pétin, M.** (Inst. National d'Orientation Professionnelle, Paris, France) **Motivation and vocational guidance.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 126-133.—Motivation must be taken into account when advising a person regarding a vocation. The author points out that the definiteness of an idea about a career depends upon nearness to entering professional life. A lack of variety of choices by young people is indicated by the narrow range of professions chosen.—*B. T. Jensen.*

5696. **Schutz, Richard E., & Baker, Robert L.** (Arizona State U.) **A comparison of the factor structure of the Kuder Occupational, Form D for males and females.** *Educ. psychol. Measmt.*, 1962, 22(3), 485-492.—"A factor analysis of the 42 raw scores obtained on the Kuder Preference Record—Occupational, Form D by 488 college freshmen females yielded a factor structure directly comparable to that obtained previously for a sample of males drawn from the same population. Although the eight factors extracted in each analysis appeared to be directly parallel, certain nuances in the pattern of loadings for several scales were identified. The implications of the findings for practical test usage were discussed."—*W. Coleman.*

5697. **Skawron, P. R.** (Rupertstr. 303, Pretoria, South Africa. **Berufsberatung als Lebensberatung und ihre Methodik.** [Vocational guidance as counseling and its methodology.] *Z. exp. angew. Psychol.*, 1962, 9(2), 317-338.—Multiple capabilities of man suggest that a person can probably find satisfaction in more than one vocation. Therefore, the counseling task in vocational guidance is stressed. It weighs the personality factors in addition to the skills of a client and directs him to suitable fields rather than to a particular vocation. A method of vocational guidance under these aspects is described.—*W. J. Koppitz.*

5698. **Thompson, A. S.** (Columbia U.) **The sense of vocation.** In G. Nielson, (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 142-148.—Vocational choice is a process involving many decisions. Vocational counselors need to diagnose the vocational maturity of clients, help them evaluate their own development and self-concepts, and help them get information.—*B. T. Jensen.*

OCCUPATIONAL & CAREER INFORMATION

5699. **Auman, Fred A.** (Philadelphia Gas Works) **Retraining: How much of an answer to technological unemployment?** *Personnel J.*, 1962, 41(10), 505-507.—The results of both private and public retraining programs have been disappointing. In the Armour and Company study, only 13% of 433 employees were successfully retrained after their jobs were eliminated. In Bridgeport, Connecticut, the government was successful in retraining only 2% of the more than 4000 unemployed, semiskilled workers they considered for training for other available semiskilled jobs. Many (28% of the Armour group and

61% of the Connecticut group) were not sufficiently motivated to participate in the selection process. Among the deterrents to entering retraining were unemployment benefits and home ownership which reduced willingness to relocate. Only a little more than 1/3 of each group who were tested met the minimum test requirements for the training. The chief problem seems to be that "we are eliminating the 80 IQ jobs but haven't yet determined what to do with the 80 IQ jobless."—*M. B. Mitchell.*

5700. **Dittes, James E.** (Yale U.) **Research on clergymen: Factors influencing decisions for religious service and effectiveness in the vocation.** *Relig. Educ.*, 1962, 57(4, Res. Suppl.), 141-165.—Interrelated questions of recruitment, selection, and training of persons for religious vocations in the light of available research are discussed.—*S. A. Walters.*

5701. **Laurent, P., & Philonenko, A.** **Le débile mental dans le monde du travail.** [The feeble-minded in the working world.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(3), 217-399.—The whole issue is devoted to the socioprofessional adaptation of the feeble-minded. Numerous psychological, phenomenological, psychotechnical, sociological, and pedagogical analyses are included. The following conclusions are drawn: (a) Vocational distribution of the feeble-minded depends exclusively upon social prejudice, working conditions, and training conditions relevant to each type of work. This explains the very large number of feeble-minded (31%) working in the building industry. (b) Few feeble-minded are out of work. This may be explained by a vocational stability expressing limited adaptation. (c) The feeble-minded is not a mere drudge; most often in the city, he is a specialized worker and even manages to become semiquified without his employers noticing his deficiencies. In view of these findings, it is felt that concrete possibilities may be envisaged in the form of a new reeducation system, the creation of new vocational outlets, and close collaboration between reeducation and vocational orientation organizations.—*V. Sanua.*

5702. **Segal, Bernard E.** (Goucher Coll.) **Male nurses: A case study in status contradiction and prestige loss.** *Soc. Forces*, 1962, 41(1), 31-38.—Interview data from 22 male and 79 female nurses, employed in the same private psychiatric hospital, reveal that prestige may decrease for the male employed in an occupation predominantly staffed by females. It is suggested that a person's occupational prestige does not solely depend upon the ranking of that occupation, but also upon certain evaluations. It is further suggested that consideration of how far one fails to meet the expectations assigned to his category may be important for the study of occupational prestige.—*A. R. Howard.*

5703. **Shuval, Judith T.** (Hebrew U., Jerusalem, Israel) **Social factors conditioning recruitment of nurses in Israel.** *J. Hlth. hum. Behav.*, 1962, 3(2), 82-88.—The recruitment of nurses in Israel was studied by means of clinical interviews with 50 1st-year nursing students, questionnaires given to 247 1st-year student nurses, and an occupational interests questionnaire given to 1266 high school girls. The data were interpreted in the frameworks of the affective-nurturant personality component and social class. Conclusion: There is, apparently, "a high

interest in the nursing profession among lower class girls with a high affective-nurturant personality component, and a relatively low interest in the profession by upper class girls lacking an affective-nurturant component in their personalities."—L. A. Ostlund.

5704. Skawran, P. F. (P. O. Box 395, Pretoria, South Africa) Ein Beitrag zur Psychologie des "Arbeitsbildes": I. "Ideale" und "reale" psychologische Arbeitsbilder. [Idealistic and realistic occupational profiles.] *Psychol. u. Praxis*, 1961, 5(4), 146-157.—Realistic profiles were developed. Supervisor ratings and test scores from 404 workers in 28 skilled trades with at least 5 years experience were obtained. A factor analysis of the test scores identified 4 factors: general intelligence, memory, practical and technical, and form discrimination. The workers were grouped into high and low on the basis of the supervisory ratings. A composite criterion of ratings and test scores determined success and furnished the basis for the profiles.—H. Roemmich.

SELECTION, PLACEMENT, APPRAISAL

5705. Cannon, Dennis, & Olson, Howard C. SPANOCON: Span of control. II. Effect on reliability of free and forced distributions in rating. *HumRRO res. Memo.*, 1961, Subtask Spanocon, Task 11-28. 9 p.—Ratings forced into "a symmetrical, essentially normal distribution" were not significantly more reliable than free ratings.—R. Tyson.

5706. Cassie, Alex. Constancy and change in pilot aptitude. In Frank Geldard (Ed.), *Defence psychology* (see 37:4053). Pp. 91-98.—A discussion of the changing skills necessary for piloting modern high-performance military aircraft and the consequent need for revised selection methods.—G. H. Mowbray.

5707. DeJung, John E., & Kaplan, Harry. (USA Personnel Research Office, Washington, D. C.) Some differential effects of race of rater and ratee on early peer ratings of combat aptitude. *J. appl. Psychol.*, 1962, 46(5), 370-374.—Peer ratings of combat potential made by 669 Caucasian and Negro army recruits of the squad members were examined. The hypothesis that ratees would receive higher ratings from members of their own race than from members of another race was supported ($p < .05$) for all ratee samples. The hypothesis that raters would give higher ratings to men of their own race than to men of another race was supported for Negro raters but not for Caucasian raters. The obtained significant differences appeared basically a reflection of higher ratings received by Negroes from Negroes. For practical purposes the effect on the recruit's average rating score was negligible because of the preponderance of Caucasian raters within squads exhibiting no rating preferences.—*Journal abstract*.

5708. Delys, Louis. Contribution à l'étude de critère d'appréciation de la valeur militaire de sous-officier candidat à l'avancement. [Contribution to the study of criteria for the estimation of the military value of NCO candidates for advancement.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 134-149.—Research oriented to the construction of a merit-rating system for evaluating NCO candidates for promotion. Accent is placed on his capacities as a leader and an instructor. Resulting from the research are 2 questionnaire forms

available to commanders that provide both validity and reliability. Examples of both forms are given.—G. H. Mowbray.

5709. de Wet, D. R. A compact flicker-fusion machine and its application to air-pilot candidates. *Psychol. Afr.*, 1962, 9, 100-118.—The construction and application of a flicker-fusion machine is described with accompanying photographs and diagrams. 2 groups of pilots ($N = 163$ and 152) were given the test experimentally. "It might be preferable to conduct the test by subdued artificial light than daylight. . . foveal measurement appeared more reliable than peripheral." These 2 variables appear to have a common function. "No significant r 's were obtained between the visual CFF and . . . span of attention, speed of perception, insight, learning, speed on a complex reaction test, perseveration (motor), and mental alertness. A high biserial r was obtained between high CFF and tendency to free expression of emotion. . . There appears to be a significant relationship between CFF and success or failure on courses of flying training."—J. L. Walker.

5710. de Wet, D. R. A variable co-ordination test and its potentiality as a gauge of aptitude for airmanship. *Psychol. Afr.*, 1962, 9, 86-99.—Diagrams and photographs illustrate a test which has been devised to measure muscular coordination. A study measuring the hand-foot coordination of air-pilot candidates was done ($N = 47$). "Fast working is associated with success." Fear of punishment as measured by a shock slowed up performance significantly. Talkativeness and sociability were associated with success.—J. L. Walker.

5711. de Wolff, C. J. A factor analysis of the old and the new test battery of the Royal Netherlands Navy. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 77-86.—A study to compare the old and the new test battery of the Royal Netherlands Navy. The former is similar to one used by the British Navy, while the latter is similar to that in use by United States military services. Results of a factor analysis indicate that the new battery measures the same factors as the old one; and since administration and scoring is much improved, the new battery is to be preferred.—G. H. Mowbray.

5712. Gibson, W. A. (Personnel Research Office, Dept. Army, Washington, D. C.) Class assignment in the latent profile model. *J. appl. Psychol.*, 1962, 46(6), 399-400.—The latent profile model provides a way of establishing an empirically-based typology from quantitative measures, and this paper sketches a method for assigning any person's score profile to its most appropriate type.—*Journal abstract*.

5713. Gordon, Leonard V. Development of a new Navy-enlisted man classification battery. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 53-76.—A description of the development of the Navy Activities Preference Blank, which when used in conjunction with the new enlisted classification battery "should increase the utility of the new battery for differential classification purposes."—G. H. Mowbray.

5714. Hicks, John A., & Stone, Joics B. (Aerojet-General Corp., Azusa, Calif.) The identification of traits related to managerial success. *J. appl. Psychol.*, 1962, 46(6), 428-432.—To evaluate the effectiveness of a test battery in discriminating be-

tween successful and unsuccessful managers, a comprehensive battery was administered to 76 supervisors of an autonomous, medium-sized operating division. Results from the Guilford-Zimmerman Aptitude Survey, California Test of Mental Maturity, and Structured-Objective (S-O) Rorschach Test were related to ratings of overall performance, promotability, and versatility by peers and superiors. The test battery showed significant correlations with peer ratings in all three of these areas (.46-.68), but showed a significant correlation (.44) only with the supervisors' evaluation of versatility. The S-O Rorschach Test proved to be the most effective test in the battery.—*Journal abstract.*

5715. Hudson, W., Roberts, A. O. H., van Heerden, C. D., & Mbau, G. G. The usefulness of performance tests for the selection and classification of Bantu industrial workers. *Psychol. Afr.*, 1962, 9, 189-203.—Skilled and unskilled Bantu workers, both male and female (N ranged from 48 to 586) were given the following tests: bolts and nuts, sorting, cube construction, tripod assembly, formboards, wiggly blocks, Kohs blocks. They proved useful in discriminating unskilled from skilled workers. 3 hypotheses are discussed in explaining the findings.—*J. L. Walker.*

5716. Humphreys, Lloyd G. (U. Illinois) Stability of airman classification test scores. *USAF PRL tech. docum. Rep.*, 1962, No. 62-3. iv, 7 p.—Stability of Air Force test scores was examined as 1 facet of the long-range prediction problem. Data for high school students were obtained on Air Force classification tests from an original test session at midyear of 1958-59 and a retest session 1 year later. Control groups were formed from students at 3 class levels tested only once. Mean growth in aptitude test scores between control class groups was of the same magnitude as the retest gains except for 2 of the airman tests: Figure Recognition and Clerical Matching. Conversions of Air Force aptitude indexes to World War II Army General Classification Test (AGCT) scores show that Mechanical Index scores averaged greater gains from year to year than AGCT, while the Administration Index showed lower gains than AGCT. . . . Intercorrelations of test obtained over the 1-year period were not appreciably lower than those obtained without intervening time.—*USAF PRL.*

5717. Kamfer, L. Army instructor selection: Development of a miniature situation test for the assessment of instructional ability and its contribution to a test battery. *Psychol. Afr.*, 1962, 9, 44-59.—A miniature test situation is described together with a statistical analysis of its use with 23, 36, and 37 instructors, and 79 and 82 trainees. The test "appears to hold promise." Further research is indicated.—*J. L. Walker.*

5718. Kamfer, L. The utility of a buddy rating procedure as opposed to a sociometric test for the identification of military leaders. *Psychol. Afr.*, 1962, 9, 37-43.—Buddy ratings measure the same quality as the sociometric test to a very great extent, and their reliability is equal to that of the test. Further study by means of factor analysis is indicated.—*J. L. Walker.*

5719. Khan, Rafi-uz-Zaman. (Cambridge State School, Minn.) Psychological methods of officer

selection. Anarkali, Lahore: Caravan Book House, circa 1950. viii, 136 p. \$2.00.—This book covers the development of the War Officer Selection Boards (WOSBs) in England in World War II and the extension and application of WOSB methods to officer selection in India and Pakistan. Also covered are recruit and "other rank" selection, organizational and sociological problems encountered in establishing WOSB selection techniques in India, and the development of nonverbal tests for use in India. Briefly reported is a study on 13,614 Indian men showing peak intelligence at age 20, a plateau until age 35, and then a decline. Another briefly reported study showed, contrary to hypothesis, no significant differences in intelligence between provinces in India.—*B. Rimland.*

5720. Kragh, U. (Lund U., Denmark) Predictions of success of Danish attack divers by the Defense Mechanism Test (DMT). *Percept. mot. Skills*, 1962, 15(1), 103-106.—3 small groups of Danish attack divers have been tested with the Defense Mechanism Test (DMT), and the protocols coded, rated, and ranked independently by 3 raters. All the raters' predictions, based exclusively on the DMT, correlate positively and significantly with the criteria. It is suggested that the DMT is suited for predicting success of various types of personnel working under conditions of stress.—*W. H. Guertin.*

5721. Lacavalerie & Nicolas. Recherches sur quelques aspects de l'efficacité au combat. [Research on some aspects of combat efficiency.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 19-29.—In an attempt to discover what behavioral characteristics distinguish the good combatant from the not so good and to develop stable prognostic tools, experiments were performed on French soldiers of European background in combat units in Algeria. Rating scales, personality tests, and psychomotor tests of various kinds were used in the search for valid criteria. Some success was obtained, but the general conclusion which emerges is that more objective criteria than are at present available are desperately needed.—*G. H. Mowbray.*

5722. McQuitty, Louis L. (Michigan State U.) Multiple hierarchical classification of institutions and persons with reference to union-management relations and psychological well-being. *Educ. psychol. Measmt.*, 1962, 22(3), 513-531.—For assessing individual differences in mental health, an objective method called Multiple Hierarchical Syndrome Analysis has been developed. The method permits classification of Ss in terms of their most predominant patterns, next most predominant patterns, etc. An illustration of the method is presented using the patterns of characteristics of industrial companies. The method is based in part on these assumptions: a classification assumption, principle of maximum classification, and the computation of residual agreement scores. Weaknesses in these assumptions are discussed as well as general limitations in the use of the method.—*W. Coleman.*

5723. Marks, Melvin R. Development of human proficiency and performance measures for weapon systems testing. *USAF ASD tech. Rep.*, 1961, No. 61-733. vi, 85 p.—Methods for evaluating human performance are discussed and compared for validity, reliability, objectivity, standardization, and economy.

Personnel Subsystem Test development constraints are considered and methods are proposed for the construction, scoring, administration, and standardization of measurement instruments. Appendices are included which exhibit sample content, sample computation, and definitions of terms of the personnel subsystem.—*USAF ASD*.

5724. Meyer, H. H., & Walker, W. B. (General Electric Co.) **A study of factors relating to the effectiveness of a performance appraisal program.** *Personnel Psychol.*, 1961, 14(4), 291-298.—Of 49 employees reporting performance appraisal feedback sessions with their supervisors, 21 had taken constructive actions as a result. This criterion was found to be associated with: (a) how well the manager handled the appraisal discussion, (b) preference for intermediate level risks, and (c) attitude toward merit plan. The skill with which a supervisor handles the appraisal feedback session with subordinates is a key factor in determining the effectiveness of the appraisal program in motivating behavioral change.—*A. S. Thompson*.

5725. Mumford, Jack, & Smith, John P. **The development of performance criteria for turret mechanics.** *HumRRO res. Memo.*, 1961, Subtask Mobility X, Task 11-23. 17 p.—A proficiency test for turret mechanics was developed for purposes of selection, course content and emphasis, and standards of instruction. Test description and norms are supplied.—*R. Tyson*.

5726. Pinto dos Santos, Delfim. **Analyse caractérogique des aptitudes militaires.** [Character analysis of military aptitudes.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 87-90.—The author makes a plea for the wider use of character analysis as developed by Heyman and Wiersma in selecting individuals for specific military duties.—*G. H. Mowbray*.

5727. Polin, A. Terrence; Morse, Richard J., & Zenger, John H. (U. Southern California, Los Angeles) **Selecting programmers from in-plant employees.** *Personnel J.*, 1962, 41(8), 398-399.—A survey regarding methods used for selecting employees to develop auto-instructional programs for training employees was made of 50 educators and 70 company-employed professionals. Of these 120, only 49 had significant experience in selecting and evaluating programmers. Those who used personality selection criteria showed a slight tendency to consider task orientation as most important. Less than 1/2 thought tests important. The more experienced thought the expensive trial-and error performance data the most satisfactory method for selection at present.—*M. B. Mitchell*.

5728. Smode, Alfred F., Gruber, Alin, & Ely, Jerome H. **The measurement of advanced flight vehicle crew proficiency in synthetic ground environments.** *USAF MRL tech. docum. Rep.*, 1962, No. 62-2. vi, 120 p.—This report is devoted to the presentation and discussion of major considerations in the design of systems for measuring the proficiency of advanced flight vehicle crews in synthetic ground environments. Emphasis is given throughout to the logic of proficiency measurement and the general problems involved rather than to the analysis of specific details. Successive portions of the report deal with general measurement concepts, procedures and

steps in designing measurement systems, an example application of the material presented, and the anticipated characteristics of advanced flight vehicle simulation equipment related to proficiency measurement. In addition, an historical overview of aircrew proficiency measurement emphasizing early work and a list of study references on rating methods are appended. As it provides a considerable background of information of proficiency measurement, this report will be of interest to individuals directly concerned with simulator training programs, proficiency evaluation and standardization, training standards, and training equipment procurement for advanced flight systems.—*USAF MRL*.

5729. Sprunger, J. A. (System Development Corp., Santa Monica, Calif.) **The ability of the individual to contribute to his group.** *Personnel Psychol.*, 1961, 14(4), 317-330.—A Group Contribution Inventory was developed and found to correlate .36 with a rating criterion in an Army base setting. The correlations were not affected by particular group membership. (35-item bibliogr.)—*A. S. Thompson*.

5730. Sydiaha, Daniel. (U. Saskatchewan) **Interviewer consistency in the use of empathic models in personnel selection.** *J. appl. Psychol.*, 1962, 46(5), 344-349.—Personnel selection interviewers predicted the responses of applicants to 2 paper and pencil tests. Comparisons were made between these predictions and the responses of applicants (accuracy score), predictions and the responses of interviewers (similarity score). (These scores were referred to collectively as empathy scores.) Statistical analysis of empathy scores and their components indicated marked inter-interviewer inconsistency, which was interpreted to mean that interviewers tend to make errors by resorting to empathy as a basis of decision making. Explicit, actuarial bases of decision making in interviewing are advocated. Results of a follow-up study supported this interpretation.—*Journal abstract*.

5731. Tromp, J. **Selection of apprentices for the South African Air Force.** *Psychol. Afr.*, 1962, 9, 60-62.—The validity of the training program for apprentices was studied together with the validity of 9 tests and an interview used in personnel selection ($N = 92$). "There is significant positive correlation between the different training phases and certain arbitrary criteria. . . all training phase results . . . tend to have a low correlation with the Air Force Trade Test. . . the predictive value of the Artisan Test Battery . . . appears to be satisfactory. . . aptitude for practical work as measured by supervisor assessment cannot be predicated successfully either by test scores or by results from . . . examinations themselves."—*J. L. Walker*.

5732. Tromp, J. **Selection of South African Air Force fighter controllers.** *Psychol. Afr.*, 1962, 9, 67-71.—A test battery developed for the selection of ground control interception operators "predicts the theoretical as well as the practical aspects of the criterion with a satisfactory degree of accuracy [$N = 51$]." The criteria are the training results at different stages of a course offered to these men.—*J. L. Walker*.

5733. Walther, Regis H. (Dept. State, Washington, D. C.) **Self-description as a predictor of rate of promotion of junior Foreign Service Officers.**

J. appl. Psychol., 1962, 46(5), 314-316.—An experiment to determine relationship between responses to an attitude, interests, and background questionnaire, and rate of promotion of Foreign Service Officers. Ss, who had completed an 89-item questionnaire May 1958, were divided first into an experimental group ($N=20$) and a cross-validation group ($N=49$), and then into high and low groups on the basis of promotions as of January 1961. Of the scales developed from previous studies, only the Social Isolation one proved to be useful. However, 2 new elements, Optimism and Self-Potency, proved to be effective measures for predicting the criterion. A correlation of .60 was found between the combined scores on these 3 elements and speed of promotion for the cross-validation group.—*Journal abstract.*

5734. Waters, L. K., & Wherry, R. J., Jr. (USN School Aviation Medicine) **Evaluation of two forced-choice response formats.** *Personnel Psychol.*, 1961, 14(4), 285-289.—The reactions of a sample of 188 flight candidates in the USN Pre-Flight School were used to investigate the effect of response format on S resistance to a forced-choice self-rating scale. The Ss were found to be more favorable toward a response format allowing them to indicate the degree of applicability of each statement in the forced choice pairs, even though they were still forced to choose one statement as relatively more applicable.—A. S. Thompson.

5735. Wendt, R. A. **A culture-common test of intelligence: The development of the Select-R Test.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 40-52.—The construction of a 65-item test for use in screening Canadian Army recruits is described, along with procedures adopted to insure validity and reliability. It was found to have "useful validity and satisfactory reliability" for the purposes for which it was designed. Further, its use over extended periods of time with diverse samples, both military and nonmilitary, indicated its applicability to English-speaking populations from various parts of Canada (including isolated communities), to French-speaking peoples, and to foreign-born adults regardless of education levels.—G. H. Mowbray.

5736. Wernimont, Paul F. (U. Minnesota) **Re-evaluation of a weighted application blank for office personnel.** *J. appl. Psychol.*, 1962, 46(6), 417-419.—The validity of weighted application blank scores in predicting length of service of female office personnel of a large midwestern manufacturing company showed a slow but consistent decline from 1954 to 1959. After reweighting the application blank variables by the usual procedure, a Pearson r of .39 was obtained between WAB scores and tenure on a cross-validation sample of 208 individuals. Only 3 variables (high proficiency at shorthand; did not leave last job because of pregnancy, marriage, sickness, or home problems; and will begin work on the new job 1 week or more from now) retained their predictive validity from 1954 to 1959. Some of the variables were assigned different weights, and others were given weights for the 1st time. It was recommended that weights assigned to application blank responses be reviewed at least every 3-5 years.—*Journal abstract.*

5737. Van Lierde, Anne-Marie. **Essai de validation d'un test de surveillance sur une population**

de chauffeurs d'autobus. [An essay on the validation of an inspection test used with bus drivers.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(2), 193-205.—A special apparatus devised by Faverge to test drivers was used with bus drivers and workshop men. The drivers were on the average superior to the workshop men. Drivers with few accidents were compared with drivers who had a number of accidents. Differences in performance were found to be significant.—V. Sanua.

TRAINING

5738. Bass, Bernard M. (U. Pittsburgh) **Mood changes during training laboratory.** *J. appl. Psychol.*, 1962, 46(5), 361-364.—30 trainees completed a mood adjective check list at 5 periods during a 10-day sensitivity training laboratory for management. Results indicated that differences and predictable shifts in mood do occur. Specifically, skepticism and anxiety decreased as most trainers would expect; other moods, like depression and aggression, showed the effects of particular laboratory procedures. The results also provided independent evidence of the validity of the factored Nowlis and Green check list of mood adjectives. Findings generally were consistent with trainer beliefs about mood changes in trainees and conformed to expectations about the effects on mood of defeat or victory in intergroup competition.—*Journal abstract.*

5739. Berger, Richard A. (Texas Technological Coll.) **Comparison of static and dynamic strength increases.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 329-333.—This study determined the changes in dynamic strength produced by static training and, conversely, the changes in static strength produced by dynamic training. Static strength improved significantly more by training statically than dynamically, and, conversely, dynamic strength improved significantly more by training dynamically than statically. There was no significant relationship between improvement in static and dynamic strength.—*Journal abstract.*

5740. Berger, Richard A. (Texas Technological Coll.) **Optimum repetitions for the development of strength.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 334-338.—The purpose of the study was to determine the optimum number of repetitions with which to train for quickest strength improvement. 9 groups, consisting of a total of 199 male college students, were tested before and after 12 weeks of progressive resistance exercise. Each group trained differently in repetitions per set. Resistances employed were 2 RM, 4 RM, 8 RM, 10 RM, and 12 RM for one set. The optimum number of repetitions was found to be between 3 and 9.—*Journal abstract.*

5741. Bryan, Glenn L. **Training of electronics maintenance technicians.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4055). Pp. 150-160.—An attempt is made to present a trouble-shooting rationale. "Analysis of present training courses and the weaknesses of present school graduates have both suggested the need for substantial revisions of training procedures. Recent successes of various synthetic devices and the demonstrated advantages of certain feedback techniques have been cited as attrac-

tive bases for the necessary modifications."—G. H. Mowbray.

5742. Campbell, Robert L. (Winona State Coll.) **Effects of supplemental weight training on the physical fitness of athletic squads.** *Res. Quar. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(3), 343-348.—The purpose of this study was to determine how weight training affected the physical fitness of football, basketball, and track and field squads when it was used as a supplement to normal training during different halves of the season. In each sport the athletes were divided into 2 matched groups: one did weight training during the 1st ½ of the season only, and the other group during the 2nd ½ only. In general, the resulting statistics show that weight training adds significantly to the physical fitness produced by normal training (16 ref.).—*Journal abstract.*

5743. Demaree, Robert G. **Development of training equipment planning information.** *USAF ASD tech. Rep.*, 1961, No. 61-533. vi, 101 p.—In the development of Air Force Systems, the timely procurement and delivery of training equipment is essential. Many human factors and engineering considerations enter into the determination as to what items of training equipment will best serve the purposes of a particular system. This report attempts to take proper account of both the engineering and human factors considerations but places special emphasis upon the latter. The report is divided into 7 sections entitled: "Introduction," "An Overview of Training Equipment Planning," "Training Functions for Various Types of Training Equipment," "Training Equipment Costs," and "TEPI Development." The appendices cover: "Explanation of Terms," "The Personnel Subsystem and Its Elements," and a selected bibliography. Liberal use is made of graphic and tabular presentations to illustrate the principles presented.—*USAF ASD.*

5744. Eckstrand, Gordon A., & Rockway, Marty R. **Spacecrew training: A review of progress and prospects.** *USAF ASD tech. Rep.*, 1961, No. 61-721. iv, 23 p.—This report reviews current progress and future prospects in the field of spacecrew training. Descriptions of all current astronaut training programs are presented, and a number of general conclusions with reference to such training are drawn, based upon the manned space operations which have been conducted to date. In addition to the actual experience which has been gained in training spacecrew personnel, a review is presented of recently completed and current research which is directly relevant to this problem. Several areas in which research should be accelerated are identified.—*USAF ASD.*

5745. Eckstrand, Gordon A., Rockway, Marty R., Kopstein, Felix F., & Morgan, Ross L. **Teaching machines in the modern military organization.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 170-196.—A survey of some representative teaching machines available to the services and a rationale for their use to alleviate some of the training problems that beset the modern military organization. Some discussion is given to the need for research on teaching machines, particularly as regards effective information display and the proper use and application of such devices.—G. H. Mowbray.

5746. Ekman, P., Friesen, W. V., & Lutzker, D. R. (U. California School Medicine) **Psychological**

reactions to infantry basic training. *J. consult. Psychol.*, 1962, 26(1), 103-104.—MMPI is given to recruits in 1st, 4th, and 8th week of basic training. The 8th week group is more willing to admit mild antisocial behavior. The changes imply "more callous attitudes, a tendency to ignore the needs of others, and feelings of self-importance increase slightly . . . less prone to examine their own responsibility for conflicts, and more ready to react aggressively."—E. R. Oetting.

5747. Haggard, Donald F., & Shock, Ronald G. **The effectiveness of visual demonstrations of signs of malfunction and wear in quipment.** *HumRRO res. Memo.*, 1962, Subtask Mobility VI, Task 11-23, 26 p.—2 photographic training aids, in handbook and slide forms, were compared for detection of malfunction and wear in armor equipment. The "principal role of such demonstration seems to be to supplement verbal description through repetition, thereby possibly increasing retention." Copy of illustrated maintenance handbook.—R. Tyson.

5748. Havron, M. Dean. **Military tradition and scientific progress.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 302-311.—Research on methods of training 9-man rifle squads led to some major insights into traditional training techniques and to some new and demonstrably superior methods. One important outcome was the demonstration that flexibility in leadership practices based on generalized concepts of leadership can improve the performance of groups led by men of only average ability.—G. H. Mowbray.

5749. Krumm, Richard L., & Farina, Alfred J. **Effectiveness of integrated flight simulator training in promoting B-52 crew coordination.** *USAF MRL tech. docum. Rep.*, 1962, No. 62-1. v, 79.—This report represents the findings of a study designed to assess the value of a B-52 flight simulator electronically linked to a T-2a navigator trainer in promoting crew coordination. 75 SAC aircrews undergoing B-52 transition training at Castle Air Force Base were used as Ss. Integrated and nonintegrated simulator training of these crews was contrasted. The results as indicated by certain of the measures used enable a favorable recommendation to be made regarding the effectiveness of the B-52 integrated crew trainer. In the report, special attention is devoted to a discussion of 2 aspects of communication, pattern and volume, and the relation of these aspects to crew coordination.—*USAF MRL.*

5750. McMahon, Denis. (U. Edinburgh) **An international study of the conditions for effective military training.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 107-112.—An investigation into the relationship between length of service and military efficiency conducted at the request of SHAPE on NATO armies in the field. By a combination of objective interviews and conferences with commanders, a method was evolved for determining the length of training time required for units to reach a plateau of efficiency. It was concluded that under normal conditions 12 months training were required for ordinary troops and 18 months for detachment commanders.—G. H. Mowbray.

5751. Prien, Erich P., & Powell, David R. (Western Reserve U.) **A study of the director's functions.** *J. Amer. Soc. Train. Directors*, 1961, 15

(4), 12-17.—Responses of 24 training directors and their superiors to a 125-item position-description questionnaire were correlated across all items. An inverse centroid factor analysis was performed which yielded 10 factors which were named: General Administrative Duties; Preparation and Execution of Management Training Activities; Public Relations Aspect of the Training Director's Job; Planning Necessary for Effective Training; Stimulating Safety Behavior and Safety Consciousness; Personnel Administration and Supervision of Trainees; Personnel Activities Not Related to the Training Function; Responsibility, as a Member of the Management Team, to Promote the Company; Evaluation of Trainees by the Training Director; and, tentatively, Self-improvement. Superior-subordinate agreement was greatest for factors which involve training directly, while disagreement was greatest for factors unrelated to training.—*Author abstract.*

5752. Siskel, Maurice, Jr., & Smith, Wayne D. A preliminary training study of the H-34 cockpit procedure trainer. *HumRRO res. Memo.*, 1960, Subtask Reflect I. ii, 20 p.—An experiment supported the value of 3 pre-aircraft training hours in the H-34 cockpit procedures trainer for learning H-34 helicopter operations.—*R. Tyson.*

5753. Sloan, E. P. RCAF experience with the training of NATO aircrew. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 113-126.—Canada, as part of her contribution to the North Atlantic Treaty Organization, undertook to provide aircrew training for NATO member nations. This is an account of the experience gained in that program since 1950, with suggestions as to how increased cooperation among member nations could serve to increase the efficiency of training programs in general. A specific plea is made for greater contact between defense psychologists, particularly in the areas of aptitude testing and test validation.—*G. H. Mowbray.*

5754. van Rooyen, J., & Cortis, L. E. Opleiding van voorman: Navorsing oor die waarde van "training-within-industry"-kursusse as opleidingsstegniek. [An investigation of the value of the training within industry" course as a technique in training supervisors.] *Psychol. Afr.*, 1962, 9, 176-188.—Trainers and supervisors in the mining industry were given a training within industry (TWI) course. Their achievement was compared with scores on intelligence tests and with the achievement of trainers in the same industry. Short courses given supervisors did not improve their knowledge of TWI principles. Trainers achieved more effectively than supervisors and were more systematic in their approach to problem solving. All measures of learning the principles discriminated between supervisors and trainers. These measures also correlated positively with each other and with tests of abstract intelligence.—*J. L. Walker.*

The effects of schedules of collective reinforcement on a class during training in target detection. *HumRRO res. Memo.*, 1962, Subtask Firepower IV, Task 11-26. ii, 14 p.—Group training with slide material proved equal to individual training in target detec-

tion. A graded sequence in terms of difficulty is preferable.—*R. Tyson.*

5756. Woolman, Myron. On-site training of guided missile operators: Evaluation materials. *HumRRO res. Memo.*, 1960, Task Lock-on I. 74 p.—Research, methods, forms, and tests relating to guided missile operator training are presented in detail.—*R. Tyson.*

TASK & WORK ANALYSIS

5757. Adams, Oscar S., & Chiles, W. Dean. Human performance as a function of the work-rest ratio during prolonged confinement. *USAF ASD tech. Rep.*, 1961, No. 61-720. iii, 44 p.—The purpose of this study was to investigate the feasibility of using a 4-hours-on-duty and 2-hours-off-duty schedule in the operation of advanced aerospace systems. 2 B-52 combat ready crews were confined for 15 days in a simulated advanced system crew compartment and were tested with a battery of 5 performance tasks and 4 psychophysiological measures. Data obtained during 2 15-day testing periods are summarized in the main body of this report. Additional performance data obtained from 5 studies using college student Ss are presented in appended sections of this report. These results are based on 4 96-hour investigations (2 with a 4-on and 2-off schedule and 2 with a 6-on and 2-off schedule) and 1 120-hour control group study (4 hours per day, 5 days per week, for 6 weeks). With proper control of selection and motivational factors, crews can work effectively for periods of at least 2 weeks and possibly longer using a 4-on and 2-off work-rest schedule.—*USAF ASD.*

5758. Bergum, Bruce O., & Lehr, Donald J. (USA Air Defense Human Research Unit, Fort Bliss, Tex.) Vigilance performance as a function of interpolated rest. *J. appl. Psychol.*, 1962, 46(6), 425-427.—2 experiments were performed on the effects of interpolated rest upon monitoring performance at both high and low signal rates. Experiment I employed 2 groups of 20 Ss each; Experiment II employed 2 groups of 10 Ss each. One group of Ss worked on a light monitoring task for 3 30-min. periods separated by 10-min. rest periods. The 2nd group worked continuously for 90 min. on the same task. Experiment I employed 24 signals/hr.; Experiment II employed 6 signals/hr. The results indicated a highly significant facilitation of detection performance as a result of interpolated rest at both signal rates and demonstrate the effectiveness of relatively brief rest intervals in maintaining high performance even with low signal rates.—*Journal abstract.*

5759. Bergum, Bruce O., & Lehr, Donald J. (USA Air Defense Human Research Unit, Fort Bliss, Tex.) Vigilance performance as a function of paired monitoring. *J. appl. Psychol.*, 1962, 46(5), 341-343.—2 experiments were performed to determine the effect of pairing of Os upon individual monitoring performances. Both studies employed 2 groups of 20 Ss each. Group 1 consisted of paired monitors and Group 2 consisted of isolated monitors. Experiment I employed a rate of 24 signals/hr.; Experiment II employed a rate of 6 signals/hr. All Ss monitored a circular light display for a period of 90 min. Neither experiment indicated an overall facilitation of performance resulting from pairing, but both demonstrated significant relationships between per-

formances on the members of the pairs. It was hypothesized that the degree of conversational interaction between members of the pairs might account for the observed effect.—*Journal abstract.*

5760. Fitts, Paul M. (U. Michigan) **Military skills in a changing technology.** In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 99-103.—A discussion of the evolution of skills required by modern weapon technology.—G. H. Mowbray.

5761. Folley, John D. **Research problems in the design of performance aids.** *USAF ASD tech. Rep.*, 1961, No. 61-548. vi, 51 p.—Performance aids are auxiliary devices provided to facilitate on-the-job performance by humans in man-machine systems. They may be included in the system at any stage of development, with their potential contribution greater if they are considered early, diminishing as their inclusion is delayed to later stages of system evolution. A number of research problems identified during preparation of a procedure for incorporating performance aids into systems are presented under 5 major headings that denote the logical steps involved in designing aids and integrating them into a system. Few of the issues and problems are new. Viewing them from the point of regard of performance aids, however, may provide a new emphasis and a new approach to the problems. Preliminary ideas on approaches to some of the problems are provided. The point is made that programmatic, multivariate research studies are needed to make significant progress on the problems.—*USAF ASD.*

5762. Itel'son, L. B. **Kibernetika i voprosy psikhologii truda.** [Cybernetics and problems in the psychology of the work.] *Vop. Filos.*, 1962, 16(4), 32-46.—The author deals with the possibilities of the cybernetic approach for the development and application of objective mathematical methods of research in the psychology of work. Although the cybernetic approach has its limits, it enables one to secure valuable results for solving the practical problems of mutual adaptation of machine and man and those of construction of regulators that simulate certain aspects of man's "controlling activity."—I. D. London.

5763. Klemmer, E. T., & Lockhead, G. R. (IBM, Yorktown Heights, N. Y.) **Productivity and errors in two keying tasks: A field study.** *J. appl. Psychol.*, 1962, 46(6), 401-408.—Productivity and error rates were measured for a billion responses by more than a thousand operators of IBM card punches and bank proof machines in 20 different installations. Productivity increases and errors decrease during the 1st year on the job, sometimes longer. Experienced card punch operators average 56,000 to 83,000 key-strokes per day with 1600 to 4300 strokes per undetected error. Experienced bank proof machine operators average 4350 to 6600 checks per day with about 3500 checks per undetected error. The fastest operators at any installation produce twice as much as the slowest. The least accurate operators make 10 times as many errors as the most accurate. Fast operators tend to make fewer errors ($r = -.5$).—*Journal abstract.*

5764. Kosilov, S. A. (RSFSR Acad. Pedagogical Sciences) **Fiziologiya vysshei nervnoi deiatel'nosti i trudovye protsessy.** [Physiology of higher nervous activity and work processes.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(3), 361-370.—Study of higher

nervous activity can shed light on the problems and processes of human work. In the development of human work appear the same laws which regulate the formation of CR, such as closing and reinforcement, concentration of nervous processes, and formation of a dominant and dynamic stereotype. Some experimental evidence is presented to this purpose.—A. Cuk.

5765. Miller, Irwin, & Freund, John E. **Investigation of spectral estimation.** *USAF ASD tech. Rep.*, 1961, No. 61-714. iii, 42 p.—Several problems of spectral estimation relevant to the determination of human-operator response characteristics were investigated. Techniques for analyzing the relationships among a set of stochastic processes are described, and the distribution of proposed spectral estimators is discussed. Tests for normality and stationarity are developed. A discussion of the analysis of multi-component systems concludes the report.—*USAF ASD.*

5766. Morsh, Joseph E. **Job analysis bibliography.** *USAF PRL tech. docum. Rep.*, 1962, No. 62-2. iv, 59 p.—The bibliography lists 1500 titles appearing between 1911 and 1961. It is especially comprehensive in its coverage of papers, both published and unpublished, issued by Department of Defense agencies and their contractors. Entries are indexed by subject.—*USAF PRL.*

5767. Rüssel, Arnulf. (Lachmannstr. 8, Braunschweig) **Belastung und Ermüdung an unterschiedlichen Arbeitsplätzen.** [Stress and fatigue at different places of work.] *Z. exp. angew. Psychol.*, 1962, 9(11), 12-54.—In a laboratory setting 3 different jobs were observed: a) control of multiple instruments on a panel, a task which involved simple and complex reactions to visual and auditory signals occurring at various delays; b) checking punched cards against a listing; and c) assembling some plates with screws and nuts with a tolerance of ± 1 mm. Reactions to upper frequencies of auditory stimuli and the accurateness of rhythm reproduction served as fatigue measures. The results show that the first task is the most difficult one and prone to considerable deterioration. Consequences of the results with respect to a theory of stress and with respect to practical applications are discussed.—W. J. Koppitz.

5768. Schultz, D. G., & Siegel, A. I. **Post-training performance criterion development and application: A multidimensional scaling analysis of the job performance of naval aviation electronics technicians.** Wayne, Pa.: Applied Psychological Services, 1962. vii, 48 p.—This research delved into the application of multi-dimensional scaling procedures to a job task constellation, the methods for applying these techniques in the work oriented situation, and the dimensions of the aviation electronics technician's job. A number of issues relating to the application of multidimensional scaling procedures to job performance measurement are discussed.—P. Federman.

5769. Siegel, A. I., Wolf, J. J., & Sorenson, R. T. **Techniques for evaluating operator loading in man-machine systems: Evaluation of a one or a two-operator system evaluative model through a controlled laboratory test.** Wayne, Pa.: Applied Psychological Services, 1962. vi, 87 p.—A test of the validity of a digital computer model for simulating a 2-operator man-machine task is described. The task involved team and individual branching, operator

stress build-up, looping, cooperative work, communication, and waiting. On the basis of nonstatistically significant differences between the task success proportions achieved by laboratory teams and the model's predictions of these proportions as well as arithmetic mean differences between the actual and predicted times for task performance, it was concluded that support is gained for a contention favoring the validity of the model.—*P. Federman*.

5770. Siegel, Arthur I., & Schultz, Douglas G. (Applied Psychology Service, Wayne, Pa.) **Thurstone and Guttman scaling of job related technical skills.** *Psychol. Rep.*, 1962, 10, 855-861.—"Working within the Naval job specialty (rating) of aviation machinist's mate, it has been demonstrated that check lists of tasks normally performed by strikers (trained men of minimum job experience) in this specialty can be scaled by both the Thurstone and Guttman techniques. Two different types of check lists were developed; the checkout type appeared to be less satisfactory from the standpoint of scalability, than the in-service training type. . . . Although aptitude tests were predictive of achievement in the Naval training school basic to the job specialty, neither the tests nor school achievement appeared to be related to the Guttman scales. . . . The finding of task scalability seems to indicate an aspect of the structure of the job, as well as to provide a basis for the construction of short, convenient job performance evaluation instruments."—*B. J. House*.

WORK ENVIRONMENT & PERFORMANCE

5771. Coermann, Rolf R. **Mechanical impedance of the human body in sitting and standing position at low frequencies.** *USAF ASD tech. Rep.*, 1961, No. 61-492. vi, 39 p.—The theory of mechanical impedance of systems with 1 or more degrees of freedom is applied to the human body. A method of measuring mechanical impedance and determining parameters of the vibrating systems is developed. Impedance curves for longitudinal vibrations of a sitting and standing Ss are established for the frequency range of 1-20 cps. The influence of varied posture and restraining systems is investigated. Dynamic movements of body parts are measured, directly or indirectly, and compared with the impedance curves. The responsible elements in the body for the apparent resonances are identified. Correlations between the impedance function of the body and the subjective tolerance curve to vibration are found and the reasons for the tolerance limits are elucidated. The variability of subjective tolerances due to varying posture, restraining systems, cushions, duration of exposure, and vibrations are discussed, and conclusions for the development of projective devices are drawn. The correlation between the steady state response of the human body system and the effects of impact is discussed.—*USAF ASD*.

5772. Dunn, J. M. **Psychomotor functioning while breathing varying partial pressures of oxygen-nitrogen.** *USAF SAM Rep.*, 1962, No. 62-82. 11 p.—70 male Ss worked on a compensatory pursuit task (USAF SAM Multidimensional Pursuit Test—CM813E) for 4 consecutive hours. Nitrogen content in gas breathed was varied. Variations in nitrogen partial pressure were not accompanied by variations in performance. Increasing partial pressure of oxy-

gen increased Ss' ability to resist work decrement.—*M. C. Payne, Jr.*

5773. Grunske, M. E., Rohles, F. H., Jr., Belleville, R. E., & Wilson, G. L. **Chimpanzee performance on a two-dimensional discrete tracking task.** *USAF ARL tech. docum. Rep.*, 1962, No. 62-16. 19 p.—A chimpanzee was trained to perform a 2-dimensional discrete tracking task with 25 target positions in each dimension. Performance required manipulation of 2 levers to align the tracking indicators with the target. Subsequent to this, the operation of a 3rd lever resulted in the delivery of a food pellet reward and presentation of a new set of targets to be matched.—*USAF ARL*.

5774. Hammer, Lois R. **Aeronautical systems division studies in weightlessness.** *USAF WADD tech. Rep.*, 1961, No. 60-715. viii, 93 p.—Facilities and techniques used at Aeronautical Systems Division to study the effects of weightlessness are described; completed experiments and those started before January 1961 are discussed. Topics are grouped under 2 main headings: Aerospace Medical Studies and Aeromechanics Studies. Specific problem areas and methods of experimentation are emphasized. Findings are briefly stated.—*USAF WADD*.

5775. Hornick, Richard J. (Bostrom Research Lab., Milwaukee, Wis.) **Effects of whole-body vibration in three directions upon human performance.** *J. engng. Psychol.*, 1962, 1(3), 93-101.—Compensatory tracking ability, choice reaction time (RT), foot pressure constancy, peripheral vision, and visual acuity were measured before, during, and after exposure to vibration (frequencies from 1.5 to 5.5 cps; intensities of 0.15, 0.25, and 0.35 g peak acceleration). Significant impairment was noted in tracking, RT, foot pressure, and peripheral vision during and following exposure, supporting the conclusion that the low frequency vibration found in many ground and air vehicles can cause decrements in vehicle control performance.—*D. C. Hodge*.

5776. Kaehler, Richard C. **The effects of transverse accelerations and exponential time-lag constants on compensatory tracking performance.** *USAF ASD tech. Rep.*, 1961, No. 61-457. vi, 34 p.—A study was conducted to determine the effects and interactions of front-to-back transverse accelerations, in the magnitudes of 0 g, 3 g, and 6 g, and exponential time-lag constants of 0.1, 1.0 and 2.0 seconds on human control performance on a compensatory tracking task. In general, the results substantiated predictions of human tracking performance based on Helson's U-hypothesis and Principle of Generality. Concepts from information theory are introduced to explain certain learning phenomena which occurred in the course of the experiment.—*USAF ASD*.

5777. Kama, William N. **Effects of simulated weightlessness upon positioning responses.** *USAF ASD tech. Rep.*, 1961, No. 61-555. iii, 12 p.—The speed and accuracy of positioning movements as functions of distance, direction, and mass were investigated under simulated weightless conditions. Ss seated on a frictionless device made blind positioning movements by sliding each of 2 frictionless masses (1000 or 7000 grams) various distances (10, 20, and 40 cm.) either left-to-right or near-to-far. Both speed and accuracy decrease with distance; left-to-right movements take longer, but are more accurate

than near-to-far movements. Speed decreases with increased mass. With minor exceptions, the effects are similar to those noted when fixed Ss position weightless objects. The responses of fixed Ss were slower, but more accurate, and were not affected by the variable of mass.—*USAF ASD*.

5778. Kamchatnov, V. P. (Medical Inst., Kazan, USSR) *Issledovanie vyssheĭ nervnoi deiatel'nosti u liudeĭ, rabotaiushchikh v absoliutnoi temnote i na svetu*. [Higher nervous activity in people working in complete darkness and in light.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 208-212.—40 women working in complete darkness and a control group of 29 women working in light were conditioned by means of Ivanov-Smolenskii motor technique. It was found that the experimental group showed some typical features, such as an increased RT, a greater number of disinhibited differentiations, and a pronounced successive inhibition. This was explained in terms of a gradual decrease in the cortical tone and a disturbed equilibrium between the basic cortical nervous processes.—*A. Cuk*.

5779. Rholes, F. H., Reynolds, H. H., Grunzke, M. E., & Farrer, D. N. A performance schedule for extended space flight with the chimpanzee. *USAF ARL tech. docum. Rep.*, 1962, No. 62-14. 11 p.—This report describes a schedule designed for measuring animal performance during space flight which is oriented toward sampling simple motor behavior and visual and auditory monitoring, as well as requiring performance for food and water. Employment of this schedule should facilitate the animal to human extrapolation.—*USAF ARL*.

5780. Rohles, F. H., Jr., Grunzke, M. E., & Reynolds, H. H. A detailed account of chimpanzee performance during the ballistic and orbital Project Mercury flights. *USAF ARL tech. docum. Rep.*, 1962, No. 62-15. 36 p.—2 space flights with chimpanzees were made as part of the Project Mercury program. In the 1st flight the S was placed through a ballistic trajectory and during the flight had to perform a continuous and discrete avoidance task. During a 2nd flight in which the capsule orbited the earth twice, a chimpanzee had to perform a complex multiple operant task.—*USAF ARL*.

5781. Steele, Jack E. Motion sickness and spatial perception. *USAF ASD tech. Rep.*, 1961, No. 61-530. iv, 23 p.—Theories of motion sickness are reviewed and compared with a new theory in which the activity of the central nervous system is more important than the intensity or modality of sensory stimulation. Concepts treated are the development and validation of an intertrial reference frame; the perceptual transformation of sensory data, which reduces its content, increases its reliability and can incorporate compensations for environmental variables, and the consequences of perceptual inadequacy.—*USAF ASD*.

5782. Steininger, Konrad. (Moorreye 43, Hamburg) *Aktuelle, luftfahrtpsychologische Probleme*. [Topical problems in aviation psychology.] *Z. exp. angew. Psychol.*, 1962, 9(1), 104-139.—Perceptual problems and psychological adaptation to the changed physical conditions of the flight situation form the core of the problems that must be considered in the selection of flight personnel. A close cooperation be-

tween psychology and medicine is advocated for effective research in this area.—*W. J. Koppitz*.

5783. Thompson Ramo Wooldridge. (Cleveland, O.) *Propellant-atmosphere system study*. *USAF WADD tech. Rep.*, 1961, No. 60-622. xiv, 222 p.—2 broad aspects of using chemical energy to provide metabolic oxygen in a manned space capsule were studied: man's ecological requirements and supply of auxiliary power. The studies were restricted to chemicals used in propulsion systems with emphasis on by-products useful to man. A survey of methods for meeting environmental requirements included evaluation of (a) passive temperature control in terms of capsule size, shape, surface emissivity, orbital altitude, orientation, and internally generated power and (b) weight and energy requirements for supplying oxygen, dehumidifying, and removing CO₂ in the cabin. The best of 40 fuels and 35 oxidizers were screened for other important factors. The unique adaptability of the cryogenic hydrogen-oxygen fuel system was demonstrated. This system combined with a hydroxy fuel cell was used in developing a prototype designed to accommodate 1 man for 3 days and to supply 1 kilowatt of electric power. The prototype included optimization studies of the cryogenic storage system, an air-conditioning system, and a fuel cell power system.—*USAF WADD*.

MOTIVATION, ATTITUDES, TRAITS

5784. Bhatt, L. J. Incentives and the working class. *Psychol. Stud., Mysore*, 1962, 7(2), 55-61.—Some studies on incentives have shown that 9 incentives are important in industry: security, wages, advancement, benefits and working conditions, type of work, hours of work, supervisor, co-workers, and holidays. The most preferred were choice of work, advancement, and co-worker. These were followed by wages, conditions of work, and supervisor.—*U. Pareek*.

5785. De Brisson de Laroche. Evolution de la motivation pour le pilotage de chasse. [Evolution of motivation in the fighter pilot.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 127-133.—A longitudinal study of the factors that motivate a fighter pilot throughout the course of his career. Certain attitudes of pilot candidates, interpreted as the "love of taking risks," are transformed in experienced pilots into "denial of fatigue or anxiety." The more individualistic motivations of younger pilots are channeled by group influences into the "esprit de corps" associated with the well-trained squadron.—*G. H. Mowbray*.

5786. England, G. W., & Stein, C. I. (U. Minnesota) The occupational reference group: A neglected concept in employee attitude studies. *Personnel Psychol.*, 1961, 14(4), 299-304.—Analysis of attitude questionnaire responses of 3207 employees in 26 firms revealed large occupational differences in terms of item responses. This finding points to the need for special scales for different occupational groups, for controlling for occupation before relating attitudes to criteria, and for occupational norms.—*A. S. Thompson*.

5787. Greene, J. E., Sr., & Greene, J. E., Jr. (Georgia State Coll. Business Administration) Illustrative uses of the "incomplete" sentence technique in investigating certain attitudes of middle

management personnel. *Personnel Psychol.*, 1961, 14(4), 305-316.—Incomplete sentence responses of a group of middle management participants in a management development conference and of their superiors were analyzed to study attitudes related to the management training program, individual and company morale, and self-perceptions of role. The procedure for analysis, scoring, and treatment of the data are given as illustrative of this technique.—A. S. Thompson.

5788. Misiti, Raffaello. *Sujets faciles et difficiles dans la prédiction d'adaptation à la vie militaire.* [Easy and difficult cases in the prediction of adaptation to military life.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 30-39.—An experiment designed to investigate the predictive validity of measures of adaptation of recruits to military life. A battery of tests administered prior to training yielded multiple correlations of .51 with classification at the end of the 1st year of training and .48 at the end of the 2nd year. It was possible to divide the trainees into 3 groups on the basis of how well the tests predicted their success or failure. An analysis is given of how nonquantitative measures might be used to reduce the variability of prediction.—G. H. Mowbray.

5789. Porter, Lyman W. (U. California, Berkeley) *Job attitudes in management: I. Perceived deficiencies in need fulfillment as a function of job level.* *J. appl. Psychol.*, 1962, 46(6), 375-384.—This questionnaire study investigated perceived need fulfillment deficiencies in nearly 2000 managerial positions. Respondents represented all levels of management and a wide variety of companies. 5 need categories, chosen to represent a hierarchy of prepotency of needs, were studied. Results showed: (a) Vertical level of position within management had a strong relation to the degree of perceived satisfaction of the 3 highest-order needs—Self-actualization, Autonomy, and Esteem; for these needs, satisfactions increased at each higher level of management. (b) For the 2 lower-order types of needs, Security and Social, there were no systematic changes in satisfaction in relation to management level. (c) Among the 5 need categories, Self-actualization and Autonomy were consistently regarded as the least fulfilled needs at all levels of management.—*Journal abstract.*

5790. Stoetzel, J. *Structure d'un système de valeurs et situation des valeurs relatives à la défense nationale dans cette structure.* [Structure of a system of values and the position in this structure of values relative to national defence.] In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 325-344.—A description of some preliminary studies and 1 principle study whose goal was to gather as much and as varied information as possible concerning the different domains in which values of the French population are expressed, and to define, as precisely as possible, what "national defense" means to the public at large. 3 different approaches were used: (a) a public opinion poll of 800 young people who had recently terminated their military service, (b) the administration of the Allport and Gillespie test to 600 future officers, and (c) depth interviews by psychologists of a sample of 100 workmen and 100 rural people. An extended discussion of the results is given with an outline of the kinds of future research required.—G. H. Mowbray.

5791. Welford, A. T. (St. John's Coll., Cambridge, England) *On the human demands of automation: Mental work, conceptual models, satisfaction and training.* In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 182-193.—These 4 matters seem of especial interest in considering problems of automation because they impinge strongly upon people. Each is discussed.—B. T. Jensen.

MANAGEMENT & ORGANIZATION

5792. Albers, H. H. (State U. Iowa) *Organized executive action: Decision-making, communication, and leadership.* New York: Wiley, 1961. xxi, 604 p. \$8.50.—Designed to serve the needs of a course in general management in colleges of business administration, engineering, and liberal arts, this book emphasizes factors common to organizations in general—decision-making, communication, and leadership. The 6 parts of the book are titled: "The Management Problem: Past and Present," "Organization for Management," "Decision-Making: Planning Strategies," "Planning and Control Informational Systems," "Leadership and Motivation," and "Executive Development." A name and subject index are included.—T. J. Banta.

5793. Barkin, S. (Textile Workers Union of America) *Implications of psychology in labor-management relations (a symposium): IV. Psychology as seen by a trade-unionist.* *Personnel Psychol.*, 1961, 14(4), 259-270.—It is of great importance to psychology to restore its total objectivity by applying itself more deliberately to employee and union interests. In the past, psychology has been used primarily as a tool for differentiation among employees and jobs or in employee opinion polling to ascertain attitudes and grievances to combat unions. Positive uses of psychology are to facilitate employee development, improve working conditions, and study collective bargaining procedures. Most large unions now have a central staff person who can facilitate psychological study of internal union developments and processes, leadership roles, internal power structures, etc. Collective bargaining is vital for the realization of democratic goals and the academic disciplines can help by serving the union and its leaders as well as management.—A. S. Thompson.

5794. Blake, Robert R., Mouton, Jane S., Bidwell, Alvin C. (U. Texas) *Managerial grid. Advanc. Mgmt.-Off. Exec.*, 1962, 1(9), 12-15.—Placing 2 variables—(a) organizational needs for production and profit and (b) human needs for mature and healthy relationships—on a set of coordinates, the authors, using values of 1-9, locate 5 basic attitudes and styles of control of managers. The 5 styles they categorize as: country club management, impoverished management, dampened pendulum, team management, and task management. Generally, the best long-term production is achieved and sustained when concerns for production and for needs of people are integrated in the team direction.—E. Q. Miller.

5795. Boulding, Elise. (Ed.) (U. Michigan) *Conflict management in organizations.* Ann Arbor, Mich.: Foundation for Research on Human Behavior, 1961. ii, 72 p. \$3.00.—"A report of a Seminar conducted by the Foundation for Research on Human

Behavior in cooperation with The Center for Research on Conflict Resolution, The University of Michigan." 4 basic concepts of conflict theory are outlined: the parties to the conflict, the field of the conflict, the dynamics of the situation, and management and control. Control is achieved through a "mechanism" for avoiding "pathological" or destructive resolutions. These mechanisms are of 2 kinds: unilateral or organizational. Most resolutions are by a combination of the 2. More research is needed, and there are encouraging signs that more is coming.—*E. Q. Miller.*

5796. Broadbent, Donald E. Common principles in perception, reaction and intellectual decision. In Frank Geldard (Ed.), *Defence psychology* (see 37: 4053). Pp. 197-206.—The author draws on results of laboratory experiments in such diverse fields as risk-taking, signal detection theory, vigilance, and choice reaction times to extract a common denominator which he then relates to problems of military decision-making.—*G. H. Mowbray.*

5797. Dutch Association for Industrial Psychology. Slagen en falen. [Success and failure.] *Mens Onderneming*, 1962, 16(6), 385-393.—Success in a career was reported to be contingent on, and preferably a combination of, expert knowledge, directed energy, and common sense. Well balanced individual characteristics such as ability to synchronize identification with and objectivity towards a task were considered desirable qualities. Stressed were the executive staff's responsibility for creating promotion opportunities and flexibility, combined with well prepared employees' meetings on all levels of a concern. Individual authors are D. J. van Lennep, S. G. Lijftogt, and J. A. Hendriks.—*J. A. Lückner.*

5798. Feinberg, M. R. (City Coll. New York) Implications of psychology in labor-management relations (a symposium): I. Introduction. *Personnel Psychol.*, 1961, 14(4), 239-241.—At present, the power centers in our society are government, industry, and labor. We psychologists need to understand our relationship with these power centers. This symposium deals with the triangular relationship between management, union, and the psychologist.—*A. S. Thompson.*

5799. Gilbreth, Lillian M. (Montclair, N. J.) Work and management. *Advanc. Mgmt.—Off. Exec.*, 1962, 1(9), 23-26.—The objective of work and management remains the same: "To utilize the resources of nature and of human nature for the benefit of mankind." When we define benefit of mankind we must include managing oneself, home and family life, the citizen's job, and the volunteer job. The application of management to work in business and industry is meaningless without some judgment about what it will do for the other areas of our living. "We must question our decisions." How will they affect the individual in self-management, home and family habits, the citizen job, and the volunteer job?—*E. Q. Miller.*

5800. Hulin, Charles L. (Cornell U.) The measurement of executive success. *J. appl. Psychol.*, 1962, 46(5), 303-306.—The definitions and criteria of executive success which have been used in the past show little consistency across studies. The central problem of this investigation was the empirical determination of the relationship between different meas-

ures of executive success. 3 measures of success based on absolute salary, salary increase, and levels promoted were developed. The data gathered from a sample of 50 executives indicated that had one of these measures been used rather than the others, quite different conclusions would have been drawn from the data. A rigorous analysis of the various criteria of executive success is suggested as a solution to the problem of "What is executive success?"—*Journal abstract.*

5801. Ingenohl, Ingo. (Middle West Service Co., Chicago, Ill.) Blueprint for a successful management development policy. *Personnel J.*, 1962, 41(10), 491-494.—If a company is to survive longer than its founders, personnel must be found and trained to replace them. The employees selected for training must desire to develop their own abilities and to be able to develop others.—*M. B. Mitchell.*

5802. Kornhauser, A. (Wayne State U.) Implications of psychology in labor-management relations (a symposium): II. Observations on the psychological study of labor-management relations. *Personnel Psychol.*, 1961, 14(4), 241-249.—The social sciences, including psychology, have neglected the study of union-management relations. This may reflect a tendency to accept without critical examination the orientation and values of the business managements for whom psychologists work. Union's relation to management is essentially one of opposition and conflict, not of harmony and cooperation as so many psychologists like to believe. Examples of directions for research representing a desirable shift of emphasis are: (a) why workers join unions, (b) the significance of dual allegiance, (c) relative restrictions on freedom from union and management, (d) trends in union objectives outlooks, and (e) analysis of the collective bargaining process.—*A. S. Thompson.*

5803. Levenstein, A. (City Coll., New York) Implications of psychology in labor-management relations (a symposium): III. The psychologist joins the labor conflict. *Personnel Psychol.*, 1961, 14(4), 250-259.—As the latest arrival of a professional discipline on the labor-management scene, the psychologist is viewed with less suspicion than were lawyers and time-study men when they first appeared. However, labor has a direct interest in any program which might weaken the ties between the union and its membership, and unions might perceive human relations programs in this light. The use of experts, by both sides, does not reduce collective bargaining but makes the conflict more manageable by providing the factual base from which the parties may argue. If the psychologist sees this as his function, his identification with either side need not compromise his conscience, nor reduce his stature as a scientist.—*A. S. Thompson.*

5804. Murray, H. (Tavistock Inst. Human Relations, London, England) Social process in the realization of talent. In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 80-87.—A description of problems and experiences in selecting management talent. Some possible effects of various approaches are given.—*B. T. Jensen.*

5805. Patton, Arch. (Mc Kinsey & Co.) **Executive compensation in 1960.** *Harv. bus. Rev.*, 1961, 39(5), 152-157.—This 7th annual survey, covering 587 companies in 25 industries, reveals little change in top management's pay over last year. Turnover was high. The pension of the average chief executive is now estimated to be 26% of his total earnings.—C. F. X. Youngberg.

5806. Schörner, R. **Der ideale Chef: Was erwartet sich der Mitarbeiter von seinem vorgesetzten?** [The ideal chief: What do employees expect of their supervision?] *Mensch Arbeit*, 1962, 14 (Suppl.), 48 p.—General problems of supervision are discussed, and traits expected in successful supervisors are identified and described.—K. J. Hartman.

5807. Shepard, H. A. (Case Inst.) **Implications of psychology in labor-management relations (a symposium): V. The psychologist's role in union-management relations.** *Personnel Psychol.*, 1961, 14(4), 270-279.—The common methods used by parties in conflict to reduce the resulting frustration are (a) suppression of the weaker, (b) win-or-lose fighting, (c) bargaining, (d) problem-solving, and (e) collusion. There is a role for psychologists to investigate the conditions leading to action, and the conditions under which conflicts are resolved. Experimental study of the problem-solving orientation is especially needed, particularly of the perceptions and actions of groups in conflict and their effect on problem solution.—A. S. Thompson.

5808. Singer, Henry A. (74 5th Ave., NYC) **A scientific approach to management development.** *Advanc. Mgmt.—Off. Exec.*, 1962, 1(9), 8-11.—A plea for the use of control groups, evaluation procedures, etc., by industrial concerns in the field for their management training programs.—E. Q. Miller.

5809. Sonnabend, Roger P. (Young Presidents Organization) **Executive education.** *Advanc. Mgmt.—Off. Exec.*, 1962, 1(9), 16-21.—Development programs must include 2 interdependent concerns simultaneously: (a) identifying, codifying, and meeting the educational needs and interests of the executive as he sees them and (b) planning programs based on what the executive's organization seems to require to meet the challenges of the 60s. There are 3 areas for development: (a) increased sensitivity and self-awareness, (b) practical business management and technology, (c) the understanding of the society and/or societies in which business is being done.—E. Q. Miller.

5810. Stagner, R. (Wayne State U.) **Implications of psychology in labor-management relations (a symposium): VI. Comments on the symposium.** *Personnel Psychol.*, 1961, 14(4), 279-284.—Some of the abuses referred to in the symposium presentations are less characteristic now than in the past. Also, the labor union of 1960 is not the union of 1937 and the workers often refuse to follow the lead of an otherwise popular officer. In contrast to Kornhauser's attack on objectivity, the psychologist can study industry objectively, being truly neutral with respect to both management and the union. In a society directed to the welfare of the individual, the careful use of tests for placement purposes is of value. Sound positions presented in the symposium are those on the need for diffusion of power and on

the need for research. The worker perceives himself neither as a proletarian nor as an entrepreneur. He behaves rather like a human being, full of irrationality and unconsciously determined perceptions.—A. S. Thompson.

5811. Stagner, Ross. (Wayne State U.) **Personality variables in union-management relations.** *J. appl. Psychol.*, 1962, 46(5), 350-357.—To test the hypothesis that personalities of key figures have a significant impact upon the course of union-management relations at the plant level, quantitative data were gathered on the relationship in 33 tool-and-die shops. Each manager and each steward provided personality data (Guilford-Zimmerman) and judgments of best and poorest co-workers. A factor analysis of all possible intercorrelations showed a greater than chance expectancy of significant loadings of personality measures on the factors representing basic dimensions of the union-management relationship. Within limits set by such factors as technology and union policy, the personality of the top manager or the top union official may significantly modify the course of union-management interactions.—*Journal abstract.*

5812. Taylor, D. W. (Yale U.) **Environment and creativity.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. XIV. Industrial and business psychology* (see 37: 4120). Pp. 69-79.—12 department heads in research, 12 in development, and various subdepartment heads, all in a large well-known research laboratory, were interviewed at length. All but 2 indicated that the factor most influencing creativity was the relationship between the scientist and the supervisor. The author also discusses the effect of relationships with the group and the culture within which one works. (19 ref.)—B. T. Jensen.

5813. Viteles, M. S., Wilson, A. T. M., & Hutte, H. A. **Personality and organization: The individual and the system: A symposium:** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 97-115.—3 papers dealing with management and leadership.—B. T. Jensen.

5814. Yssel, G. J. **Note on personality appraisal in managerial selection.** *Psychol. Afr.*, 1962, 9, 168-175.—The results of a selection program for managerial candidates for a corporation are described and discussed. The reliability of personality ratings made by a panel of 4 trained assessors during situational tests was significant. Projective test material was assessed by individual raters with a high degree of reliability, though interrater agreement was low.—J. L. Walker.

ENGINEERING PSYCHOLOGY

5815. Bertelson, P., & De Cae, C. **Comparison expérimentale de deux types de claviers numériques.** [Experimental comparison of two types of numerical keyboards.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(2), 131-144.—2 groups of well-trained operators were Ss; one group used the "large" keyboard where there is a set of 10 keys for each digit, and the other used the "small" keyboard where the same set of 10 keys is used repeatedly. There were no systematic differences in error rates,

but speed was better on the small keyboard for all conditions. This superiority was markedly smaller for the conditions with a large proportion of zeros, because these figures must not be keyed on the large keyboard.—*V. Sanua.*

5816. Conrad, R. **Les problèmes humains posés par le tri mécanique de la correspondance.** [Human problems arising from the mechanical sorting of the mail.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(4), 401-418.—Machines for sorting letters involve a human operator. To obtain maximal man-machine efficiency, solutions must be found for a number of psychological problems. The paper outlines and discusses 4 main areas where research is needed: (a) keyboard design, (b) multiple-choice reaction time, (c) pacing, and (d) code design.—*V. Sanua.*

5817. Fletcher, J. L., & Loeb, M. (USA Medical Research Cent., Fort Knox) **Free-field threshold shift and temporary threshold shift reduction as measures of efficiency of ear protective devices.** *J. Acoust. Soc. Amer.*, 1962, 34(10), 1629-1633.—The attenuation of 2 different earplugs and a helmet was measured by a procedure combining the free-field threshold shift and the Békésy threshold tracking methods. It was found that the helmet afforded significantly less attenuation of low-frequency sound than the earplugs and roughly the same amount at higher frequencies. The 3 devices were found to be equally effective in eliminating the temporary threshold shift following exposure to the continuous and impulsive noise. Susceptibility to one type of exposure was not necessarily significantly correlated with susceptibility to the other.—*A. M. Small, Jr.*

5818. Jensen, Barry T. (System Development Corp., Santa Monica, Calif.) **Effects of communication restriction in a small man-machine system.** *J. engng. Psychol.*, 1962, 1(3), 134-140.—Crews performed a tracking task under conditions of restricted and free communication. While the free communication situation could have resulted in better performance by enabling the crews to cooperate and organize their work, actually the members interfered with each other to the extent that their performance was not different from that of crews working under the restricted communication condition.—*D. C. Hodge.*

5819. Licklider, J. C. R. (Bolt Beranek & Newman, Cambridge, Mass.) **Bridges over the gulf between man-machine-system research and man-machine-system development.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 214-229.—Research contributes little to development because of the newness of the field, its size and complexity, the time pressure in development, and difficulties in communication. All 4 factors are related directly to "informational complexity." 4 bridges are proposed; progress in information storage and retrieval, a research strategy which replans after only a few calls in the matrix are filled, development of a taxonomy of functions, and use of computers.—*B. T. Jensen.*

5820. Rigby, Lynn V., & Gooper, Joel I. **Problems and procedures in maintainability.** *USAF ASD tech. Note*, 1961, No. 61-126. iv, 92 p.—The purpose of this report is to bring together a comprehensive analysis of the maintainability problem. The

discussion is based on a literature survey on maintainability and interviews with contractor and command personnel. The fundamentals of the over-all problem are presented, followed by a detailed analysis of the most influential elements. These elements are presented in a manner that makes an integrated explanation of maintainability a natural development of the material presented. The difficulty in measuring maintainability is discussed and recommendations for the improvement of these measurements are presented.—*USAF ASD.*

5821. Ringel, S., & Smith, P. F. **Tracking performance in the Missile Master: Target loan, tracking time, and rated performance.** *USA Personnel Res. Off. OCRD tech. res. Note*, 1962, No. 121. 26 p.—To explore the effects of target loan, duration of tracking time, and tracker proficiency upon tracking performance in the Missile Master system, trackers of high, average, and low rated proficiency were required to track real targets on operational tracking consoles. Tracking performance during 6 contiguous 10-minute periods was recorded photographically. The number of targets assigned to be tracked varied from 3 to 18 targets for the 6 periods. Accuracy indexes were computed for percentage of instances trackers' "tags" were found on target and number of targets with perfect accuracy in relation to number assigned. No statistically significant differences in tracking performances were found among groups differing in rated proficiency nor across time periods. Within 10-minute periods a small decrement in mean accuracy score was found. Mean accuracy score and mean percentage of targets tracked with perfect accuracy decreased as target load increased. However, the average number of targets tracked with perfect accuracy increased with increased target load. Individual trackers were found to differ appreciably in performance.—*A. J. Drucker.*

5822. Schwartz, N. F. **A pulse function single axis, compensatory tracking apparatus.** *USAF ASD tech. Rep.*, 1961, No. 61-734. iii, 7 p.—An apparatus which provides a one-dimensional compensatory tracking task for psychological research is described. A photograph, schematics, and description of the circuitry are included. The apparatus was developed to fulfill the requirements of a task designed primarily to compare tracking performance under normal gravity to performance under zero or other abnormal gravity. The task is to attempt to keep the spot on a cathode-ray tube centered using an aircraft- or similar-type control stick. Programmed pulses having either of 2 amplitudes and durations and separated by either of 2 intervals cause the spot to suddenly move vertically either of 2 distances up or down from center when being tracked. These pulse parameters are programmed to seem random. The forcing function pulses driving the spot and the S's response can both be recorded to yield specific data and, as presently used, afford a comparison of normal tracking performance with performance under zero gravity.—*USAF ASD.*

Memo.*, 1962, Subtask Vigil II. ii, 31 p.—Effects on the O of varied kinds and amounts of information were investigated in relation to "the defining characteristics of targets on a radar display." The "dimensional complexity of the observer's concept of a target" proved significant. Training procedures are outlined.—*R. Tyson.*

5826. **Busch, Allen C., McNair, Robert J., & Kirby, Frederick J. The data flow analysis of a mobile ATC aid: Final report.** *USAF ESD tech. docum. Rep.*, 1962, No. 62-190. x, 81 p.—An analysis was made of the internal data flow of Air Traffic Control Central AN/TSW-5 modified to include a flight path prediction computer and a time schedule display unit. This analysis indicates that the modified semi-automatic AN/TSW-5 shelter operations are improved. With computer path-prediction and scheduling provided, the communication channel load factor is less than 70% at all controller positions when handling 50 approaches per hour. Communications workload is not seen to be the limiting factor on the acceptance rate with the fully manual AN/TSW-5. The chief factor in a manual system is the extra margin of aircraft separation necessary because of the inability to precisely predict the flight paths of several aircraft converging from a multiplicity of directions toward a common final approach path.—*USAF ESD.*

5827. **Diehl, M. Joan, & Seibel, R. (International Business Machines Research Center, Yorktown Heights, N. Y.) The relative importance of visual and auditory feedback in speed typewriting.** *J. appl. Psychol.*, 1962, 46(5), 365-369.—16 skilled typists took speed typing tests under 4 different conditions: (a) normal speed typing conditions; (b) normal, but no sight of the printed line; (c) normal, but the sound of the typewriter was masked by noise fed through earphones worn by the typists; and (d) a combination of Conditions b and c (neither visual nor auditory feedback). The effects of these conditions were measured in terms of speed and accuracy of typing. Some differences among the conditions may be considered statistically significant ($p \leq .05$ on a per comparison basis), but the small magnitudes of the differences suggest: in speed typing situations the presence or absence of visual and/or auditory feedback has a relatively unimportant effect on speed and accuracy of typing.—*Journal abstract.*

Rep.*, 1962, No. 62-228. 7 p.—Methods of display sharing through the projection of several different displays onto the same screen area and selectively viewing the displays

with appropriate color filters and polarization techniques are described. Use of other devices for display sharing (dichroic mirrors, semi-specular screens) is discussed.—*USAF ESD.*

5829. **Faulkner, T. W. (Northwestern U.) Variability of performance in a vigilance task.** *J. appl. Psychol.*, 1962, 46(5), 325-328.—An experiment was conducted to determine the effect of signal pattern and frequency on the variability of S's performance in a vigilance task. Ss were 12 male college students who watched 3 dials during 3 consecutive 27-min. periods. Real signals occurred alone in 1 period while 2 different patterns of dummy signals were added in the other 2 periods. It was found that dummy signals which occurred at semiregular intervals were more effective in reducing S's variability than those which occurred at nonregular intervals. It was also found that variability increased with time. It is concluded that use of a semiregular pattern of dummy signals would be one way of improving performance on a vigilance task.—*Journal abstract.*

5830. **Fried, Charles. (USA Ordnance Human Engineering Lab., Aberdeen, Md.) Studies on the perceived threshold for motion: I. Effects of aperture dimension on threshold velocity.** *USA Ordn. Hum. Engng. Lab. tech. Memo.*, 1962, No. 6-62. vi, 31 p.—The influence of aperture dimension on the lower threshold of motion was investigated by comparing the effects of 5 differently sized aperture squares on motion threshold. The effect of aperture dimension was especially apparent for the smaller dimensions employed. The theoretical implications of these results were further explored in 2 additional experiments intended to determine if threshold values are a function of frame of reference dimensions or distance to a reference line. It was concluded that motion threshold value is a function of the latter, if a well-defined referent is provided. (34 ref.)—*Author abstract.*

5831. **Montgomery, W. D., & Broome, P. W. (General Dynamics Corp., San Diego, Calif.) Spatial filtering.** *J. Opt. Soc. Amer.*, 1962, 52(11), 1259-1275.—Spatial filtering of 2-dimensional pictorial data as an extension of 1-dimensional filter theory is applied to the problem of enhancing the detection of localized objects which are superimposed upon a noisy background. 4 types of filters are derived. These are the linear, quadratic, general statistical, and decision filters. Each filter is of the "matched" type, the different designs being associated with various degrees of knowledge about the noise statistics. A computer simulation of the linear and general statistical filters was done and examples are shown.—*Journal abstract.*
